was rather avuncular marriage which held the attention of the first travelers. Thus, Léry notes: "As for the uncle, he takes his niece" (as a wife); and Thevet: "From the time they are born, the maternal uncle raises them and retains them for future wives." (5) Magalhães

5. Léry, loc. cit. II, Ch. XVII, p. 85; Thevet, Cosmogonie universelle, p. 932.

de Gandavo expresses himself inexactly, without doubt, but [82] in

TN 601 171 582 the same sense when he writes: "It is their custom to marry the women who are their nieces, daughters of their brothers of their sisters; they regard them as their true and legitimate wives. The fathers of these women cannot refuse them, and no one, except their uncle, can claim to marry them (1)." One can refer also to

1. Pedro de Magalhes de Gandavo, The Histories of Brazil, The Cortes Society, New York, 1922, II, ch. X, p. 89.

Nobrega, Vasconcellos, Soares de Souza (2).

2. Nobrega, Cartas do Brazil, 1549-1560, Rio de Janeiro, 1931, p. 148;--Vasconcellos, Chronica da Companhia de Jesu do Estado do Brasil, Lisboa, 1865, I. LXXXII, p. 133; Soares de Souza, Tratado, CLVII, CLII.

TN 595 171 As regards polygamy and the distinction, so clear among the Nambikwara, between the first wife devoted to household tasks and the secondary wives, companions of the men and sharing their obligations, it will be remembered that Magalhães de Gandavo alludes to a category of women actually unmarried, but who take part in masculine activity (3).

3. Gandavo, loc. cit., II, Ch. 10, p. 89. One will find other information about the family organization of the ancient Tupi in: A. Métraux, La religion des Tupinamba (Paris, Leroux, 1928), passim; --Lafone Quevedo, "Guarani kinship terms as an index of social organization (American Anthropologist, Vol. 21, 1919), p. 421-440; --P. Kirchhoff, "Die Verwandtschaftorganisation der Urwaldstämme Südamerikas (Zeitschrift für Ethnologie, Vol. 63 , 1931, Ch. 15, p. 182).

TN 607 171 All of these observations authorise us to trace a parallel between the extension of the relationship of "brother-in-law" among the Nambikwara, and a custom, seemingly very close, of the ancient Tupi. First we quote from Yves d'Evreux: " A party of Frenchmen was dispersed throughout the villages to live there according to the

1: Lévi-Strauss--95 E-5 (1938-1939)1948 SP17 Nambicuara SP17
Tupinamba 509

T
607 customs of the country, which is to have Chetouasaps or hosts or
171 godfathers, giving them merchandise instead of money; and this hospitality or godfathership is very strict among them: for they actually consider you their children while you live with them, they go hunting and fishing for you, and moreover their custom was to give their daughters to their godfathers" (4). Farther on he speaks

4. Voyage dans le nord du Brésil, Ed. F. Denis, Leipzig and Paris, II, 14.

of the "French who were lodged by godfathership in these villages."(5)

5. Loc. cit., XXVIII, 109.

T The indigenous institution is confirmed by Jean de Léry (6): "it is
592

6. Loc. cit. II, Ch. 20, p. 133; cf. also, Cardim, Tratado da Terra e da Gente do Brasil, Rio de Janeiro, 1925, p. 169-170.

to be noted that these words Atourassap and Coton-assap differ, for the first signifies a perfect alliance among them and between them and us, to the extent that the goods of one are common to the other. And also that they cannot have the daughter or the sister of the first named." The "Coton-assap" is consequently, inversely as regards the preceding, privileged in two forms of marriage: that with the sister of his partner, who makes him a "brother-in-law," and that with her daughter, that is an admission to the number of maternal uncles, making of him a
N theoretical brother of the wife, which leads to the same result.
T [83] It is necessary to note another analogy in the relationship
607 between brothers-in-law among the Nambikwara and among the Tupi.
171 All the texts which we have quoted agree in admitting the existence among the Tupi of a sort of authority exercised by the young men over their sisters. The marriage of cross-cousins seems to result from a mutual exchange of sisters among the men who are related in this way. The same thing can be said when the father gives his daughter to his wife's brother. Thus, actual or potential brothers-in-law are tied by a relationship of a special nature, founded on an exchange of services of a sexual order. We have seen that such a relationship also exists
N among the Nambikwara brothers-in-law, with this difference that
[83] among the Tupi these services fall back on the sisters and daughters,

1: Lévi-Strauss--96 E-5 (1938-1939)1948 SP17 Nambicuara SP17
Tupinamba SD9

while (besides the preceding form) the Nambikwara brothers-in-law exchange payment directly in the form of homosexual relationships, which make up for the absence of an available sister.

We may now draw a conclusion. The ancient Tupi were acquainted with two types of preferential marriage: the marriage of cross-cousins, and avuncular marriage. The first appeared normally in the form of an exchange of sisters between two cross-cousins; the second resulted from a privilege over the daughter of the sister exercised by the mother's brother, or conceded to the latter by the sister's husband. In the two cases, the marriage is based on a pact between cross-cousins, brothers-in-law in right or in fact—which is the definition which we have retained for the Nambikwara terms tarúte or jópa. Moreover, this relationship of "brother-in-law" can be established under the name of chetonasap (Yves d'Evreux) or cotonasap (Léry) between individuals which no bond of kinship united before, or relatives of a different or more distant type, and even between strangers (as was the case between French and Indians). The goal was to make possible intermarriage and to amalgamate families or groups, until that time heterogeneous, into a new social unit. One recognizes the procedure which we have described in connection with the fusion of the Sabané and Tarundé (1) groups.

1. The South American practice of utilizing kinship relationships to translate and establish social ties is attested by Von den Steinen (Unter der Naturvölkern Zentral Brasiliens, 2 Aufl. Berlin, 1897, p. 286), whom the Bakairi had decided to call "older brother" and the Mehinaku "maternal uncle." We have just established the equality of the terms "brother-in-law" and "maternal uncle" in a system of marriage between cousins (cross-) joined to the avuncular marriage. As to the use of the term "elder brother," this calls for two observations. In the first place, the kinship system of the Bororo, who are not far distant from the Xingu, modifies each generation in two stages of which the one (elder) is assimilated to the younger members of the former generation and the other (younger) to the older members of the next generation. In such a system, an "elder brother" might be, in fact, a real uncle and a potential brother-in-law. The second point brings to a focus the logical difference between

1: Levi-Strauss--97 E-5 (1938-1939)1948 SP17 Nambikuara SP17.

171
601

two types of solidarity, the one, mechanical and expressed by the term brother, and the other, organic, expressed by the term brother-in-law. We have alluded to this above, p. 71.

114
601

One might object that the old authors might have interpreted doubtful observations in the light of European facts. As we shall propose [84] the name of compérage to designate an institution which we believe to be authentically Indian, it will be useful to stop for a moment at this aspect of the problem.

Without doubt the facts analyzed above, and the European institution of compérage [compaternity]offer striking analogies. At the beginning, the godfather and the godmother were connected with one another, and both of them to the parents of the child, by the mystic bonds of sponsorship. But the relationship soon became secularized in all the small rural communities, or, more exactly, everywhere where the family grouping takes precedence over the extended social group. The relationship is then employed to establish an artificial kinship line, or even, as happens among the Nambikwara to translate in kinship terms a simple phenomenon of spatial contiguity. (1) The strangers, the newcomers, are adopted

1. This derivation is well brought to light by etymology: in English, god-sib becomes gossip.

thanks to the reciprocal usage of the appellations of godfather and godmother which they receive from—and return to—their contemporaries. On the other hand, the stranger usually assimilates himself by taking a wife in his new community, and the terms godfather and brother-in-law become synonyms so rapidly that the men allied by marriage only call one another by the first. In the villages of Mediterranean Europe and of Latin America, the godfather or "compadre" is an actual or potential brother-in-law. That in certain regions of Central or South America the analogy between the Indian and European institutions has aided the first to establish and modernize itself is not doubtful. Thus, in Mexico, the primitive institution of the mozo, that is, obligation, for the heads of families to exchange presents periodically now functions in the framework of the relations of "compadres," the Spanish term offering a convenient translation of the ancient Otomi. (2)

2. Jacques Soustelle, La famille Otomi-Pame du Mexique central, Paris, Institut D'Ethnologie, 1937.

But the formal analogy of the two institutions should not disguise their truly opposite characters. In the Latin-Mediterranean society the bond, formerly mystic and now social, of compérage, can be transformed by marriage into an actual kinship line. Among the ancient Tupi, and among the Nambikwara, it is, on the contrary, the concrete kinship which furnished its model to a type of bond utilized to establish wider relationships.

That having been posed, there are two reasons why our authors could not have elaborated a pseudo-Indian institution after a European model. In the first place, men as familiar with religious problems as were Yves d'Evreux, Cardim and Léry, could not have likened a relationship whose first consequence, and the probable object, was to permit new types of marriage, to the relationship between godfather, godmother and relatives who observed very severe enforcement [85] of the prohibitions of marriage, especially since the thirteenth century. At the time when they were writing, the question had actuality, since it was set down in the program of the Council of Trent, where the ancient rules had to be a little softened. But we have a much decisive argument. From the arrival of the first missionaries, the two institutions, European and Indian, must have evolved side by side, especially among the baptized Indians. But neither they nor their European priests ever interpreted Christian sponsorship in terms of Indian compaternity. On the contrary, and more logically since the newly introduced institution carried restrictions regarding marriage, they treated it as a modality of the relationship of paternity. They likened the godfather to a classificatory father: "Thus, they (the children who come to receive baptism) regarded their godfathers as their real fathers and called them Cherou, meaning "my father," the French called them Cheaire, which means "my son," and the little girls Cheagire, "my daughter"... (1)

1. Yves d'Evreux, l. c., II, 1, p. 234.

We believe we have assembled enough information concerning the fundamental character of the relationship between brothers-in-law in the South American society so that the nucleus of an original institution of compaternity can be seen in it which appears still living among the Nambikwara. The documents here presented suggest (2)

2. An English version of these observations has been published under the title: "The social use of kinship

THEORY OF DEATH

761 [100] Death distinguishes between men on one hand, women
775 and children on the other. When they die, the former are transformed into jaguars who represent, consequently, so many reincarnated humans. The women and children, on the other hand, disappear with the wind and the storm and are not susceptible to any reappearance.

40. dend dũrige getnatũrina ednadʒre lukuĩndige ndakuĩndige monũnkiadukuĩndige dend dũrige monũre lĩrige amonotiĩrige tonodũrige nitendige (b1)
The woman and child who die do not change into beasts. The man who dies is changed into a jaguar, the woman who dies goes away with the tempest disappears with the storm.

262 Whence, among the Nambikwara, the only perfectly clear prohibition concerning food. Theoretically several exist, broken each time that the occasion is presented, such as those concerning the hawk, the worms from the hacaĩuva nuts, and there may be added a probable repugnance concerning the meat of the veado (Cervus sp.). Chickens and dogs are never eaten, but their introduction is recent.
[224 On the other hand, the jaguar can be hunted and killed, and its re-
28] mains are highly regarded since the hide is used to make the fur
714 bonnets worn in the attire of war; but it is not eaten under any pretext:

41. [following preceding text] loukuĩndige inkara uĩrige lotatũrige ikuitendige uĩrige (b1)
775 [the dead man] becomes a jaguar, another eats him, the jaguar carries him off, he is left to another in order to eat him.

This theory complements the information collected in the eastern group more than it differs from it. The jaguar in fact plays the same role as the atãtu, it also carries off the dying. But the central theory adds a complement. This is that the deceased is identified with the animal, who thus becomes a supernatural being. It was not possible to find out if the atãtu which one meets at night are considered to be the souls of reincarnated dead people. (1)

776
●171 1. One recognizes in the man-eating jaguar gifted with a supernatural nature a typically Tupi theme, although its present diffusion is much greater. See concerning this subject, Métraux, loc. cit., passim.

T16
971

and Nimuendaju, "Die Sagen von der Erschaffung und Vernichtung der Welt als Grundlagen der Religion der Apapocuva Guarani,". Zeitschrift für Ethnologie, Berlin, XLVI, 1914. Also, the atasu in question in the preceding paragraph, curiously evoke the yurupari, or ananga, ancient Tupi genies of the bush against which they defend themselves with a flaming torch which thus plays the same role as the magic javelin (cf. Thevet, cited by Metraux, loc. cit., p. 61). Finally, the atasu itself often appears in the form of the jaguar; and in the eastern groups at least, it plays the role of the Messenger of Death which the central, southern, and northern groups give over to the jaguar. There is thus in the vocabulary, a close connection between the stars, the jaguar and the atasu, already noted by Claude d'Abbeville (cited by Metraux, l. c., p. 49) among the Tupinamba: these identified the jaguar with the stars. Like the "celestial" jaguar (Montoya), the "man-eating" (Nimuendaju), the jaguar of the Nambikwara presents a remarkable ambivalence: it is sacred, and at the same time, they kill it. Finally, comparative linguistics confirms the connection. The term which means jaguar in dialect a1, inaãru is associated with the name of the jaguar among the central and southern Tupi: yaouare (Emerillon, Coudreau); saoruhu (Guajajara, Nimuendaju); jaoarohu (Tapirapé, Kissenberth).

[101] COMMUNICATION WITH A SUPERNATURAL WORLD: SHAMANISM.

787

It is considered possible to receive visions of far-distant things and revelations of future happenings. These supernatural communications are usually produced upon the occasion of tempests and storms. They are sudden and unforeseen. Every adult male is apt to [263] receive them, for in this case too, the women (except, it seems, the oldest) are excluded from the spiritual life:

42. iãiãdãni dẽnõ tamũmatatjani nahoe ejãni ekuẽjeni kanahãdau uatli aikuaauatlikentete (b1)
Invisible to women the men see it [the thunder]: "Far away I see, close by I see, tomorrow it will arrive, very near it will arrive."
(It is a question here of a warning vision of messengers come from another tribe).

injection of pao preto (ikatu n'seram, a1), put in the eye with the aid of a funnel of leaves from whose lower extremity the liquid falls drop by drop. But other maladies, considered the result of poisoning (or of a charm; in both cases: nãnde) are exclusively within the domain of the sorcerer. He makes the "arrows of thunder" (ndaõrede, b1) in all points similar to those used for hunting except that their dimensions are much more restricted. The treatment consists of three operations: throwing the arrows around the sick person to carry away the spirits; sucking the body to force out the cause of the illness; this cause is thrown far away when it has been captured:

43. ãdige underãdige kadirjenka ungeraige tenundige (b1)
throw, throw far away the little thorns sucked with the mouth, throw away [the evil]. (1)

1. The informant made it known that by "little thorns" he meant to designate the "arrows of thunder" which are only several centimeters in length. One notes the same assimilation in other regions of South America. Thus, the informant of Karsten in the Chaco (R. Karsten, "Indian tribes of the Argentine and Bolivian Chaco," Societas Scientiarum Fennicae, Commentationes Humanorum Litterarum, IV, 1, p. 132-133) cites as the cause of the malady and the way of combatting it, an "arrow" or "splinter").

[103] Afterwards the sick person is usually cured and can take up his work again:

44. enendige deendige enena dejdnige (b1)
To be sick is finished [one can] continue.

However, the sorcerer can establish much closer relationships with the supernatural powers. During our stay in his group, C20 disappeared, or more exactly did not return to camp at the usual hour. The other men, having gone hunting, had not seen him the whole day. Night fell and toward nine or ten o'clock in the evening, the most profound consternation reigned in the camp and particularly around the fire of the man who had disappeared, whose two wives and child held themselves embraced while mourning in advance the death of their husband and father. At this moment we decided to look around, accompanied by a few Indians. We had only to walk 200 meters to discover C20, crouched on the ground and shivering in the darkness. He was completely naked, that is, divested of his

[581] Dutemõdednige (b1), say the Nambikwara men; "it is a good
582 thing to marry." But it is not easy. The ideal marriage is the one which gives a "young and pretty woman" (monodunũere, b1) whose virginity one will have (to break the hymen: tauorõtige, b1). But such women are precisely the ones who are claimed by the chiefs or shamans, and only a few young men will have a chance to obtain such wives. The others are condemned to a long period of celibacy
[838] which they will break by having sexual relations with their brothers-in-law, or else they will marry an "old woman" who cannot have sexual relations (tiroanebiriere, b1), one who is widowed or repudiated, whom no one wants. Such marriages are not rare among the Nambikwara, and are explained by the fundamental economic role of the couple which we have already commented on. But they are not permanent. When the young man feels his position in the group
582 strengthened, or when a better occasion is presented he abandons
586 (amnjõtige, b1) his old wife to take another (ulamtunjõtige, b1) who
587 is younger and more seductive. It happens that a man thus marries three or four wives successively before considering himself satisfied.(1)

[71]

1. Here also, the documents of the 16th century relating to the Tupi support the comparison: "... at times they take some old woman from whom they do not expect children, because there are no others, only so that they will cook the food, since they have no mother or sisters-in-law to take care of them, thus they are cared for, and are contented at present time with some old woman by whom they are always well treated and then taking other women by whom they have children later, either leaving the first wife or keeping her, if she wishes, for the reason mentioned above." (Anchieta, loc.cit., p. 260-261).

The repudiated woman [111] goes to live with her parents if they are still living, joins up with another man if she has the opportunity or even remains her former husband's fire, whose existence she shares and whose tasks she participates in, but in a slightly inferior position. Such is the position of b3 in the household of her ex-husband B1. Another method of obtaining the young woman desired consists of
836 seducing her, even if she is married. Adultery and more generally sentimental intrigues are very frequent among the Nambikwara.

THE COLORS

822 The differentiation of colors has been studied in eleven patterns for which we give the list of Indian terms below.

Groups a and b present common characteristics. They distinguish white, black, red, blue, and put yellow and green in a single category. (1) However, while group a extends that assimilation to yellow ocher, group b stops at clear yellow and classes yellow ocher with burnt sienna in the same category, designated by the term of dialect a1 for "black." (2) Group c distributes the colors in a very different way: one same category unites the reds and the yellows (which furthermore suggests the scale of the tincture of urucu), while the blues are attached to green and black.

[193 197 117]

1. The term which designates green and yellow affects the singular form of a reduplicative plural. This morphological aspect is found again in Śiḅṣa: Thus in Bribri, green = tspa-tspa, yellow = kŏlo-kŏlo; in Guatuso, yellow = mari-mari; in Rama, yellow = nugnugna, green blue = nrinnrinma. (Cf. Lehmann, loc. cit., I, p. 333, 394, 434, 435).

[826]

2. In accord with the anthropological judgment of the Indians who do not distinguish themselves from the "whites" as "yellow," but as the "colored" from the "clear":

(56) uñi ʔaniena tañkedniena (b1)
You are fair (clear), I am dark.

The most esteemed colors are white and black, undoubtedly because these are the colors of the ornaments made from pearly fragments of river shells and from the dark nuts of the palm tree. Then comes red, then yellow. Green and blue are not much liked. [117]

822 182

Colors	Dialect a 1	Dialect a 2	Dialect b 1/2	Dialect c
White	ahẽndesu	ahẽndesu	delẽnde	pãte
Black	ũndne	atuũdisu	ụãre, dẽdẽne	tapũte

[that it is necessary]
kanengore kanengore kanengore
that a moon end that a moon end that a moon end
natlitnjãni (b1)
in order that they arrive.

The whole story can be summed up as follows: alone of all the 773
humans, one old woman succeeded in escaping the Flood by hanging to the top of a buriti palm. By letting some nuts fall from the palm into the water, she was able to measure the decline of the water, and when the ground was dry, she came down and was delivered of a son. Through an incestuous union with her son, she then gave birth to twins of different sex, and from their incestuous union was born a new generation of twins. Thus, the whole of humanity would be descended from a series of marriages between twins, each giving birth to a new couple. As men multiplied, new villages were founded, always further away. So much so that today men live at such distances from one another that they do not speak the same language, do not understand one another, and must travel for whole months in order to visit.

This version offers several points in common with others collected in distant regions of South America. It is doubtless necessary to interpret the throwing of the palm nuts in the light of the "magical projection" 773
which has been studied above. (1) The throwing of small nuts certainly 171

1. Cf. p. 96.

possesses a magic significance. The same episode is found in several versions of the legend of the Flood, (2) and its magical value is formally attested

2. Cf. for example the Tupi version collected by Thevet, cited by Métraux, loc. cit., p. 45.

for the Ŝipaia by Nimuendaju. (3) In older versions, the old woman (since

In older versions, the old woman (since the old women share the magic powers of the men among the Nambikwara as also in other tribes) (4) was undoubtedly not content with measuring the

4. Cf. above, p. 101.

fall of water by the duration of the fall of her nuts, she actually provoked it by throwing them. Whatever the case may be, "magical projection" is probably found at the origin of the theme of the throwing of small fruits or grains in South American folklore.

[122] PSYCHOLOGICAL ATTITUDES

The Nambikwara offer the observer a very special psychological and moral aspect, and one which we have not found again either among their immediate neighbors--Paressi, tribes of Guaporé, and Tupi of the Gi-Parana--or among other South American tribes. It is worth an attempt to separate its principal characteristics. Few of the primitive South Americans display so much spontaneity and freedom in their behavior. Few manifest such ease in psychological relationships, and such grace of expression. Thus, in their relationships with the ethnologist, the informants introduce formulae which constitute true sociological inventions in order to respond to a new situation, on the part of individuals who do not use either a formula of greeting or of leave-taking in their own social relationships:

60. tai undejretnĩ ta ejkirednĩ uɬi jiren undetnĩ tatjene uɬi iritjani. (b1)
I am going to sleep, I am going away, you go to sleep, I will stay, you go away.

Or to put an end to an interrogation of which they are weary:

61. iejtɬana amnentĩ hikonarijna iatjen amdenĩ konahdiaŋ jedetnĩ. (b1)
This is useless, it must be left; one does not see clearly any more, this is useless, let us leave it; tomorrow we will talk.

Or again:

62. nakanajõnjani nihin nalirjani. (b1)
I have forgotten, wait till I remember.

Their daily life is full of exuberance. It is not only in the games of ball that one hears joyous exclamations:

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

sionaries had not yet learned enough Iranxe to make working with informants possible.

As all of the following information, unless otherwise specified, relates to the Wakítisu band, a short description of this band is in order. Today the band consists of 18 individuals, of which Julio is the chief. About 5 years ago, before a measles epidemic decimated it, the band was roughly twice the size it is today. Julio is a man of middle age, has three wives and two children, and probably holds his leadership by being the strongest and ablest man in the band. Except for one of Julio's wives and her daughter who are Elótasu, the members of the band are Wakítisu and related to one another. Julio took the Elótasu woman from the Elótasu band by killing her husband. He claims he did this because the Elótasu chief stole one of his wives some years ago. He claims he is going to steal another wife, for every chief is supposed to have four. Only three other men, Martin, Marciano, and Joaquin, are married, each having one wife. The remaining four are either widowers or as yet unmarried.

Of all the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were the most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covered with some kind of scaly skin disease from head to foot, and another was deaf and dumb. The women and children, however, appeared to be healthy. Owing to the fact that they use no hammocks but sleep on the ground, they are always covered with dirt. On cold nights they remove the fires and sleep in the warm ashes. The Wakítisu wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat, makes proximity to them rather distasteful. They also appear to be heavily infected with internal parasites, for their stomaches are distended and they are continually passing wind. On several occasions when a number of them had crowded into the small room we used for working we had to cease work in order to air the room.

In their manners the Nambicuara also contrast sharply with the other tribes I visited. The

181 Caduveo, perhaps remindful of their slave-owning
• 171 past, are proud, conceited, and boastful. The Arawak-speaking Terena and Paresí, like the Arawak-speaking Waurá, are quiet, unassuming, friendly, and ready to help yet take no liberties. The Umotina speak only when spoken to and appear to wish to be by themselves. They provide information if they think the gifts are sufficient and to their taste; otherwise, they saunter off and are never available when required. An Umotina does just what he wishes to do and hates any kind of dictation. The Bacairí and Camayurá are intimately friendly, talkative, and ingratiating, expect gifts and bestow gifts in return, volunteer information, are full of humor and curiosity, and are clean and polite.

181 The Nambicuara, on the other hand, are surly,
576 and impolite even to rúdeness. On many occa-
609 sions when I went to visit Julio at his camp he was lying down near a fire and as he saw me approach he turned his back to me saying that he did not wish to talk. The missionaries informed me that a Nambicuara will ask for some object several times and if it is not given to him he will try to take it. In order to keep the Indians out they would sometimes close the screen door, but if a Nambicuara really wanted to enter he would tear a hole in the screen and walk in. The Nambicuara have two well-recognized ways of showing disgust or disdain. One day I stopped a woman carrying a burden basket to take her photograph. She evidently did not like being stopped, for as she passed me a moment later she turned her back to me and passed wind. This the missionaries claimed is a very common custom of the Nambicuara. The men have an even stronger way of showing disbelief and disgust. After listening to something with which he does not agree a Nambicuara will get up, grasp his penis, and slap it sharply against his groin and walk off with a "that for you" look. One might call it a Nambicuara "raspberry." Although some of these personality
181 traits are old and culturally defined, there appears
648 to be little doubt that the Nambicuara have a deep hatred of the white man. They realize that the white men are rich compared with themselves and that contact with the whites has brought diseases which are killing them off rapidly. They realize, too, that both the whites and the Paresí consider them in the lowest category of human beings.

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

[101] 181 648 The Paressí call the Nambicuara "those who sleep on the ground" and ridicule them in other ways. One does not have to remain long among the Nambicuara in order to feel this underlying hatred, mistrust, and despair, which create in the observer a feeling of depression not unmixed with sympathy.

198 The Nambicuara is the only tribe I have met who speak pidgin Portuguese, which without some training is almost unintelligible. For instance, "bastante" becomes *marante*, "pequeno" becomes *shibi*, "grande" becomes *papai*, and "crianca" becomes *pinto*. If they wish to compare two things to bring out a likeness they say this thing is the brother of something else.

142 Compared with their neighbors, the Paressí and Iranxe, the Nambicuara are taller, darker, and ● 171 longer-headed. It is very easy, for instance, even at a distance, to distinguish Nambicuara children from Paressí children when they are bathing in the river. In contrast to the light brown of the Paressí skin the Nambicuara skin appears to have an element of black that gives it a dark-gray undertone. Many individuals have a certain amount of wave in their hair, although the waviness may be accentuated by the unkempt matted condition of the hair. Detailed measurements and indexes are given in Appendix 3.[1] The eyes of the Nambicuara are very dark brown, almost black in some individuals, and have a brightness which contrasts sharply with the rather dull eye of the Paressí. The only other Indians that I have met with this brightness of the eye are the Caduveo. This brilliance of the eyes does not appear to be correlated with health, for even the sick have it among both peoples.

131 The Nambicuara, as a whole, occupy a territory bounded on the east by the Papagaio River and on the west by the headwaters of the Rio Roosevelt and the Pimanta Bueno River. To the south they extend as far as the headwaters of the Rio Juruena and the Rio Kabishí. To the north they are bounded by a line running roughly from latitude 12°30′ on the Papagaio River to latitude 11° on the Rio Roosevelt. Formerly, it is believed, they extended farther northward. The telegraph line runs through Nambicuara territory beginning at Utiarity and ending at Barão de Melgaço 101 to the west. The territory to the south and east of the Nambicuara is occupied by the remnants of the Paressí. To the north of the Nambicuara

SP17 Nambicuara SP17

lateral or the patrilateral cross cousin; nevertheless, the chosen interpretation stresses the male side in Nambikuara society, or, let us say, it shows a strong tendency in this direction. At the same time we can see in such a solution a specifically social structure beginning to superimpose itself on the formerly simple familial units. 571 607 582

We do not intend in any way to base a theory of the origin of dual organizations on these restricted observations, the character of which is mainly anecdotal. However, this is a case where "the characteristic features of the sib organization are in some measure prefigured among sibless tribes";[1] as a matter of fact, in order to fulfil the main requirements of a system of exogamic moieties, it would be sufficient for the new unit, once fixed, to retain the recollection of its dual origin by preserving the habit of not mingling the camp fires. 571 607

Moreover, the extension of the "brother-in-law" relationship provides an instance of the increasingly superior position of the men within the group, since it is through the men that group alliances are brought about, just as wars are waged by men. 571 607 562

The preceding observations have a further value, since with their help we may be able to interpret sociological information found in the older literature on South America, especially that dealing with the Tupi of the Brazilian coast. 080

There are striking similarities between several features of the Nambikuara kinship system and what may be inferred about the ancient familial organization of the coastal Tupi. When describing small details of Nambikuara daily life, one is often tempted to quote Jean de Léry or Yves d'Evreux, so accurately do their words apply to certain live features of Nambikuara society, notwithstanding the fact that they were written four centuries before this culture became known. As a matter of fact, several metaphysical themes are common to both cultures and, indeed, certain names in the Nambikuara religious vocabulary have a conspicuously Tupi origin. The most important similarities, however, are those involving the kinship systems. In both cultures the same three principles of familial organization are stressed and are apparently similarly expressed: First the dichotomy of the parents' brothers and sisters between parallel uncles and aunts, called "fathers" and "mothers," and cross uncles and aunts, called "fathers-in-law" and "mothers-in-law;" secondly, the marriage of cross cousins with the correlative assimilation of parallel cousins to "brothers" and "sisters"; and, finally, the avuncular marriage, which, among the ancient Tupi, seems to have taken the form of a preferential union between the mother's brother and the sister's daughter. 114 171 601

An excellent text by Anchieta gives evidence of the occurrence of the first principle, as well as showing signs of the existence of the other two: 114 171

[1] Robert H. Lowie, *Family and Sib* (American Anthropologist, Vol. 21), p. 28.

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

114 171 In questions of relationship they never use the word *eie* (true) since they call their father's brothers "father," their brothers' sons "son," and their father's brothers' sons "brother"; when they wish to designate their actual father or son, they say *zeruba zemonhangara* "my father who engendered me," or, for a son, *zeraira zereminonhanga* "my son whom I engendered." I never heard an Indian call his wife *zeremireco eie*, but simply *zeremireco* or *zeracig* "mother of my children," and I never heard a woman refer to her husband as *zemenete* "real husband," but simply *zemena* or *zemembira ruba* "father of my children." They use these terms indifferently for their husband or lover. If the husband calls one of his wives *zeremireco eie*, he means the most esteemed or best loved wife and she is often the last one he took.[2]

This text also shows that the Tupi encountered a difficulty in their kinship system, namely, how to distinguish the classificatory parents or children from the consanguineous ones. This stresses the structural similarity between their kinship system and that of the Nambikuara, since the latter met with the same problem. Apparently the Tupi, like the Nambikuara, felt no need for special terms, but when it was necessary, made comments based on physiological considerations. When the Nambikuara are asked to point out the real status of their consanguineous children, they add to the name for "son" or "daughter" another word, the meaning of which is "child" or "little one." The physiological implication of this new term is perfectly clear, since is is ordinarily used to designate newly born animals, while the former terms are applied only to relationships within the human family. Complementary indications regarding the assimilation of the father's brother to a classificatory father may be found in Soares de Sousa.[3]

851 842

114 171 The old authors give numerous examples of cross cousin marriage and of marriages between uncles and nieces. Here again Anchieta will be our main source:

> Though many Indians have several nieces, and very attractive indeed, nevertheless they do not use them as wives. However, brothers have such authority over sisters that they consider their nieces as belonging to them and that they are entitled to marry them and to use them ad libitum if they wish. In the same way they give their sisters to some and refuse them to others. Taragoaj, an important chief of the village of Jaribiatiba in the plain of San Vicente, had two wives one of whom was his niece, his sister's daughter.[4]

Both types of marriage are treated as symmetrical institutions in the same document: " . . . because the fathers give them the daughters and the brothers the sisters. . . ."[5] Furthermore, cross cousin marriage is referred to by Staden:

SP17 Nambicuara SP17

"They make presents also of their daughters and sisters . . . ",[6] by Soares de Sousa,[7] Claude d'Abbeville,[8] and others. With a sound sociological feeling, Anchieta establishes a link between the custom of a man marrying his sister's daughter and the recognition of the male as the only one responsible for conception, a theory also shared by the Nambikuara. On this matter, Anchieta writes:

> They call the brothers' daughters "daughter" and treat them as such. Therefore they would not have sexual intercourse with them, since they believe that the true kinship link has its origin in the father, whom they consider the only agent, while the mother, according to them, is merely a container in which the children are formed. . . . For that reason too, they use the sisters' daughters "ad copulam" without sin. . . . For the same reason, the father will give his daughters in marriage to their uncles, their mother's brothers, a thing which, until now, was never done with the nephew who is the brother's son. . . . "[9]

Cross cousin marriage seems to have a very wide distribution throughout South America.[10] But among the Tupí avuncular marriage in particular aroused the interest of early travellers. For instance, *Léry* notices: "As to the uncle, he marries his niece";[11] and Thevet: "As soon as they are born, the maternal uncle lifts them from the ground and keeps them for his future wives."[12] Magalhaes de Gandavo expresses himself as follows:

> It is their custom to marry the women who are their nieces, the daughters of their brothers or sisters; these are considered their legitimate and true wives. Fathers of the women cannot refuse them, nor can any persons other than their uncles marry them.[13]

But this statement seems to be doubly inaccurate. For other references to the same phenomenon one may turn to Nobrega,[14] Vasconcellos,[15] and Soares de Sousa.[16]

595
171

Regarding polygyny and the sharp differentiation made among the Nambikuara between the first wife who devotes herself to feminine activities and the younger wives who are their husband's companions and share his tasks, it may be recalled that Magalhaes de Gandavo[17] refers to a special category of women, single indeed, who shared in masculine activities.[18]

171
114

The preceding similarities may perhaps allow us to establish a valid comparison between our observations concerning the extension of the "brother-in-law" relationship among the Nambikuara and what seems to have been a very similar institution among the ancient Tupi. We first quote Yves d'Evreux:

> They scattered part of the French through the villages so that they might live according to the custom of the land, which consists in having *chetouassap*, that is to say, hosts or god-sibs (*compères*), giving them merchandise instead of money. Such hospitality or god-sib relationship is very close among them, for they regard you as their child as long as you stay with them. They hunt and fish for you and, what is more, they used to give their daughters to their god-sibs (*compères*).[19]

The same author refers later to the "French who were established in the villages in a god-sib relationship (*comperage*)."[20] Evidence of the aboriginal institution may also be found in Jean de Léry:

> It is worth remarking that the words *atour-assap* and *coton-assap* differ, because the first signifies a perfect alliance between them and between them and us, so much so that the belongings of the one are common to the other. And also that they cannot have the daughter or sister of the first named.[21]

From this one may infer, conversely, that marriage is authorized with the sister and the daughter of the *coton-assap*. Therefore, the *coton-assap* is granted a double privilege: first, marriage with his partner's sister, which makes him a "brother-in-law"; and, secondly, marriage with his partner's daughter, which is equivalent to his assimilation to the rank of "maternal uncle";—then, because he is considered a theoretical brother of his partner's wife, he also becomes a theoretical brother-in-law. Actually, therefore, both privileges have the same result.

171
607
582

One more similarity between the Tupi and Nambikuara brother-in-law relationship remains to be pointed out. All the texts quoted agree that there existed among the Tupi a kind of authority held by young men over their

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

sisters. Cross cousin marriages seem to have resulted chiefly from a reciprocal exchange of their respective sisters by the male cross cousins. (The same holds for the giving of a daughter by a father.) The potential or actual brothers-in-law then enter into a relationship of a special nature based upon reciprocal sexual services. We know that the same thing may be said of the Nambikuara brothers-in-law, with the difference that, among the Tupi, the sisters or daughters of the brothers-in-law provided the object of these services, whereas among the Nambikuara the prestations are directly exchanged in the form of homosexual relations.

We may now summarize our observations. The ancient Tupi acknowledged two forms of marriage; namely, cross cousin marriage and avuncular marriage. The first was usually practised in the form of an exchange of sisters by two male cousins; the second appears to have been a right to the sister's daughter exercised by the mother's brother or granted to him by his sister's husband. In both cases the marriage is the result of an agreement between cross cousins, actually or potentially brothers-in-law—which is the definition we retained as a suitable translation of the Nambikuara terms *tarüiy* and *itepe*. Now, this special "brother-in-law" relationship could be established, under the name of *cheiwasap* (Evreux) or *coiro-assap* (Léry), between individuals not united previously by any kinship tie, or else only more remotely related, or even between strangers (as was the case of the French and the Indians). The reason for such a step was to ensure intermarriage and by this means to amalgamate familial or social groups, previously heterogeneous, into a new homogeneous unit. One recognizes here the same process described in the analysis of the relations between the newly joined groups, Sabáne and Tarindé.[2]

[2] The widespread South American custom of using kinship terms to express social relationships is attested to by Von den Steinen (*Unter den Naturvölkern Zentral Brasiliens*, 2 Aufl. Berlin, 1897, p. 286), who was called "elder brother" by the Bakairi and "maternal uncle" by the Mehinaku. We have just established the equivalence of the terms "maternal uncle" and "brother-in-law" in a system of cross cousin marriage combined with avuncular marriage. Regarding the use of the term "elder brother," two observations should be made. First, in a kinship system such as that of the Bororo, not far distant from the Xingu, each generation is to some extent split into two layers, the elder half being assimilated to the younger half of the generation above and the younger half to the elder half of the generation below. In such a system an "elder brother" may well be a true uncle and a potential brother-in-law.

The use of the term "brother" for social purposes may also be understood in another way. Among the Nambikuara, there is a special term, sometimes used to designate a sibling of the same sex, the meaning of which is "the other one." This term is applied not *only* to describe a familial relationship, but *is* also used to name objects belonging to a class which includes several units (for instance, the pests of the huts or the pipes of the whistles). Friendly groups may also consider themselves to be "brothers" and the exclamation, "You are no more *my* brother!" may often be heard in discussions between angry adversaries.

This suggests that the term "brother" possesses, in addition to its kinship significance, a very wide meaning, both logical and moral. Nevertheless, when the technical problem of establishing new social relationships is put up to the Indians, it is not the vague "brotherhood" which is called upon, but the more complex mechanism of the "brother-in-law" relationship.

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

171 The objection may be raised that the old authors have interpreted inaccurate observations in the light of European data. Since we shall suggest the use of the word *compérage*—borrowed from the French—to identify the institution, which we consider to be an authentic aboriginal one, it will be useful to discuss briefly this aspect of the problem.

Without any doubt there is a striking analogy between the facts related above and the Latin-European institution of *compérage*. Originally the *compère* and the *commère* were connected with each other, and both with the child's parents, through the mystical link of parrainage. However, the relation was very soon secularized in all small rural communities, or rather, wherever the familial structures were of greater importance than the social ones; it was then used to establish an artificial link of kinship, or, more precisely, as is the case among the Nambikuara, to express in kinship terms a purely external relationship of spatial promiscuity.[9] The stranger or newcomer was adopted by means of the reciprocal appellation of *compère* or *commère* which he received from—and returned to—his male adult contemporaries. On the other hand, since the stranger usually assimilated himself to the group by marrying within his new community, the terms *compère* and "brother-in-law" soon became synonymous, so that men allied by marriage usually called each other only by the first term. In all small communities of Mediterranean Europe and of Latin America, the *compère* or *compadre* is an actual or a potential brother-in-law. No doubt in certain regions of Central and South America the analogy between the European and aboriginal institution has helped the latter to become fixed and modernized. Thus, in Mexico the primitive institution of the *mollo*, that is, of the heads of families bound to exchange gifts at certain periods, now expresses itself by means of the "compadre" relationship, the Spanish term providing an easy translation of the earlier Otomi.[10] The formal analogy between the institutions cannot hide, however, the fact that they are really opposite in character. In Latin-Mediterranean society, the formerly mystical and, actually, social link of *compérage* may be changed, through marriage, into a real kinship tie. Among the ancient Tupi, as among the Nambikuara, the actual kinship provides the type of link used to establish wider relations.

184 171 174 This being admitted, there are two strong reasons why our authorities cannot have constructed a pseudo-institution based on a European pattern from inconsistent observations. In the first place, men as well acquainted with religious problems as were Yves d'Evreux, Cardim and Léry could not have assimilated a relationship whose first consequence and probable aim was to per-

[9] The same sociological derivation is expressed in English through the etymological origin of the word "gossip" (god-sib).

[10] Jacques Soustelle, *La Famille Otomi-Pame du Mexique Central* (Paris, Institut d'Ethnologie, 1937).

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

mit new forms of marriage to the relationship between godfathers and parents, the main purpose of which, especially since the thirteenth century, had been to impose new and very rigid restrictions upon marriage. At the time they were writing, the matter was of immediate interest and was being discussed by the Council of Trent, where the earlier rules were somewhat mitigated. But there is a much stronger argument: From the moment of the arrival of the European missionaries both institutions, the European and the aboriginal, actually coexisted among the Indians, at least among those who were baptized, and neither they nor their European priests ever interpreted the Christian "god-father" relationship in terms of the native "brother-in-law" institution.[8] On the contrary, and much more logically, since the new relationship placed restrictions on marriage, they considered it as a modality of the relation of paternity; thus, they assimilated the "god-father" to a classificatory "father."

> They [the newly baptized children] regarded their god-fathers as their true fathers and called them *Cheroa*, that is to say, "my father," and the French called them *Cheoire*, that is to say, "my son," and the little girls *Chesgire*, "my daughter." . . .[8]

Therefore, it cannot be doubted that the *couvade* is quite distinct from its European parallel.

A sufficient number of convergent indications have been recorded so that we may consider the outstanding character of the "brother-in-law" relationship a specific feature of South American sociology, constituting the core of an original institution of *couvade* which appears clearly among the Nambikuara and which, as suggested by the documents presented in this article, may formerly have had a much wider distribution on the continent.

NEW SCHOOL FOR SOCIAL RESEARCH

[8] Yves d'Evreux, *loc. cit.*, II, I, p. 234.

164 The disease of the overos is in fact equivalent to the vaurana
177 of our Tupian Indians, and actually the same as the "Carate disease" of Colombia, the "spotted disease," lota in Central America or purupuru in the Amazon.

164 [186] Spix and Martius at the beginning of the last century,
114 and after them other naturalists, found the disease spread out through the great valley. Many chroniclers dealt with it, Baena in greatest detail.

"Purupuru," [wrote Spix and Martius], "is the name given by the Brazilians to those Indians who are really called Pamaouiri and who live on the Purus River."

They described the disease of the "Pamaouiri" (or Paumary as they are called today), listing as its major characteristic the presence of irregular skin spots, isolated or converging, blackish, and somewhat coarse to the touch.

Martius believed that some white spots occasionally found among the black ones represented the initial stage of the disease.

He thought that purupuru was hereditary, although its external manifestations appeared only after puberty. The Indians Martius met attributed the disease to "a bad condition of the blood"; and the naturalist believed that the "amphibious life" of these people, their food and some of their customs had a great deal to do with the coming forth of purupuru.

Later, through dissemination of the disease, the name came to designate all the tribes of the Purus-Juruá region: Paumary, Yuberi, Arua, etc.

About twenty years ago, Ehrenreich noted certain curious facts about the manifestations of purupuru. He confirmed that the disease only develops after puberty. He found some Indians whose feet and hands were entirely white, giving the impression of a partial albinism or a kind of vitiligo.

According to Ehrenreich, the spots have a grayish blue color in the first stage of the disease. As the edges whiten, the center becomes darker.

[187] He personally never observed the scaling of affected areas. But he relates popular reports to the effect that the Paumary

Distribution of round and oval houses (After Nordenskjöld).
(Caption on p. 21.)

513 At the post of Três Buritis, where they camped with us for a few days, they disputed every night the occupancy of a crude wooden table where the station personnel ate their meals; they already appreciated our habit of sleeping above the ground.

Why, then, did they not make use of the hammocks? Because they were not familiar with it.

[248 127] They are capable of plaiting cotton and tucum (1) thread more

1. Bactris setosa (Ed.).

than adequately enough to make a hammock; and they are also capable of appreciating their neighbor's hammock, as indeed they do now.

This ethnographic trait attests to the inferior position of the Serra do Norte Indians.

[17] [228] This unfamiliarity [with the hammock] is in fact characteristic of the large Ge-Botocudo group of Brazil, which in the consensus of all who have studied it comprises the most backward aborigines in the Americas.

All Serra do Norte Indians sleep directly upon the earth. They spread nothing in the way of leaves, straw, pallets or hides between themselves and the ground.

They nearly always rest on their side, pillowing the head on the forearm.

516 The men rarely sit directly on the ground; they usually squat. The women do the reverse. If standing in one spot for more than a few minutes, a man will usually flex one leg and rest his foot against the other knee; the women assume a characteristic posture which I have never seen described and which is clearly shown on the photographs we took.

They cross their thighs, thrusting the right part of the pelvis forward and the left part forcibly backward. The longitudinal axis of the right foot, if extended, cuts that of the left foot almost at a right angle.

They frequently cross their arms.

281 When excited or roused by happiness or fear, they repeatedly slap the back of their head with their open right hand. When displeased, they make the same gesture while exclaiming: "Ikáinerá!"

411 The bows of the Serra do Norte Indians (hukiçú) are made of
771 ipê (1) wood and are very long, measuring from 1.70 to two meters;

[424]

1. [In this region, the term covers] trees of the Tecoma and Jacaranda genuses, Bignonia family. The forest variety is J. copaia, D. Don; the field varieties comprise the yellow type (T. ochracea, Mart.) and the purple or black kind (T. ipê, Mart.). (A. J. de S.)

the section is semi-circular. Of all Brazilian tribes, only the Catukina of the Purus River coil the twine around the weapon in a similar way. The cross-section of the Catukina bow, however, is quadrangular.

[Fig. 54]

We made an experiment to determine the approximate strength required to lend a bow the necesary power.

The bow we used measured 2.38 [sic] meters in length by 0.047 meter in its greatest width; its tucum cord [268] had a diameter of 0.002 meter. To set in this bow a fifty-centimeter arrow required 66 kilograms of dynamometric traction.

The [Serra do Norte] Indians use the Mediterranean release (Morse's fourth method): bow vertical, arrow resting against the left edge of the bow and held at the base between the index and middle fingers of the right hand.

In the Americas, this method is peculiar to the Eskimo; the "Redskins" employed another. In Brazil, no [other] tribe uses it as far as I have been able to ascertain; [269] for the most part, our Indians use the third method outlined by Morse.

[269] [Brazilian bows fall into the following categories listed by Hermann Meyer: 1) Peruvian; 2) Northern Brazilian; (1) 3) Guiana;

1. Semi-circular cross-section; dark red, smooth wood of a leguminous tree.

4/11 4) Chaco; 5) Eastern Brazilian.]

178 Nambicuara bows must be placed in the second group on account of their cross-section, which is indeed quite similar to that of Mundurucu bows. Their twine is coiled in the manner of Meyer's Perutypus group.

[Plates p. 248]

[271] [Fig. 58] Meyer classifies Brazilian arrows into seven groups, now insufficient because other types have since been found, but which nevertheless cover the principal characteristics of our arrows. His classification is based on the feathering of the shaft. [1) Eastern Brazilian or Tupian-Ge; 2) Guiana; 3) Xingu; 4) Araca; 5) Maue; 6) Peruvian with fibers; 7) Peruvian with resin, where Nambicuara arrows belong.] This last group is further divided in two: a northern division covering the Amazon Valley, and a southern division covering the Chaco region. The feathers are slit lengthwise, their stem scraped until only the outer layer remains; [272] they are tied spirally to the shaft by means of twine and black resin.

[Fig. 55]

4/11 Our collection includes war, hunting and fishing arrows. It must be noted, however, that these distinctions are not always maintained; when necessary, the Indians use all three types interchangeably.

Anîçô: The tip is of red wood, cylindrical, smooth; used to hunt monkeys.

[Fig. 56]

Uselicô: The tip is sharp, made of taquaruçu bamboo (Merostachys sp.); used in war and to hunt large game--capybara, tapir, jaguar. . . . .

Aleuincô: The tip is smooth, with a barb at the end.

[Fig. 57]

4/11 278 [272] Anâkirikatçô: A unique type, armed with a series of barbs secured with twine and pitch. It is coated with a black substance which the Indians believe to be poisonous; for this reason, they protect the tip with a bamboo sheath. It is a war weapon. The "poison" of Nambicuara arrows is harmless... (1)

1. [Alvaro Osorio de Almeida notes here that he carried out an

372 They make fire with mastic resin sticks, the tips of which are wrapped in straw to protect them from the rain.

[Fig. 63]

241 415 Their plots are worked with pointed sticks. The seeds of urucu, gourd plants (Lagenaria) and cotton are kept in leaf containers.

278 824 Medicinal fruit (Solanum mammosum) is also saved, as well as roots, leaves, etc.

[Fig. 31]

386 The collection contains two samples of dyes: a paste of urucu and fat, sweetly scented, which the women use to paint their body after the bath (hudubukaidi); and a variety of red ocher. [279]

248 Cotton (1) is represented by seeds (rim de boi variety) in leaf

●[71] 1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Antilles and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[248 256] containers; cotton thread (kondzú) from a spindle (gdaretatú); the ins [255] of spun cotton; cotton fabric (sarsguéné--strap used to carry children). [248] The spindle is made of a palm spinner imbedded in a round potsherd.

[Fig. 64]

415 824 Kanguí are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

[See fig. ...(28) p. 308.]

[Fig. 70]

177 Their plaiting follows patterns clearly characteristic of the
[288] Xingu (Trumai and Nahuqua) and gives proof of contact with those backward tribes which the rudimentary culture of the Nambicuara had already implied.

[85] The quadrangular barbecue, which differs from the usual pattern, is used only by the more advanced groups (Tagnani, etc.); it recalls the barbecue of the Javahe as depicted by Fritz Krause. (1)

1. F. Krause, In Den Wildnis en Brasiliens [In the Brazilian Wilderness] (Leipzig, 1911).

[201] The straw ornaments of the Nambicuara are quite similar to
197 those of the Suya. But linguistic affinities are even more indicative of contact between the two groups. No other people speaks a dialect [310] so similar to that of the Nambicuara in terms of word morphology, although the two languages are otherwise quite different.

171 It is interesting that a spontaneous affinity should arise be-
177 tween two remote and equally primitive tribes, the Guayaki of Paraguay and the Nambicuara of the Serra do Norte, from their common use of the jaguar hide helmet.

However, I am inclined to believe that the latter copied it from their neighbors, the Cayabi of the Parataninga River, who use helmets of the same material.

174 Unfamiliarity with the banana tree and with the pipe (an ob-
171 ject frequently encountered in North American mounds and Brazilian sambaquis) indicates how long the Nambicuara have been established in their mountain range.

Recognition of the Ge-Botocudo group as one of the oldest representatives of aboriginal South American populations is no longer a matter of dispute. . . . .

171 [311] There is no doubt, in my opinion, that the [Brazilian] linguistic groupings correspond to ascending stages of civilization [312]. . . . . The Serra do Norte is inhabited by a people of Ge culture evolving toward the Nu-Arawakan culture, of which they have barely reached the initial stages.

/220 cont./

278 171 [177] The Tamandé Ñambikwara, of the upper course of the Roosevelt River, assured me that curare had come to them from other Indians living farther to the north, in the region of the Gy Paraná /Gi-Paraná River/; it was not possible to make them specify what kind of Indians these were.

The Cabixiano /Cabishi?/ of the Rio Mequem, to the northeast of Ñambikwara territory, also use curare. According to a civilized Indian of this group encountered at the post of Baron de Melgaço, their product with a complex vegetable base is prepared secretly and only by a few old men; it is a hard curare in a jar. It is used for hunting, even of tapirs, and for war.

The Pareci, along with the Ñambikwara, represent the extreme southern point of the spread of curare, the use of which as one goes toward the Amazon becomes more and more frequent and its preparation surrounded with more mystery.

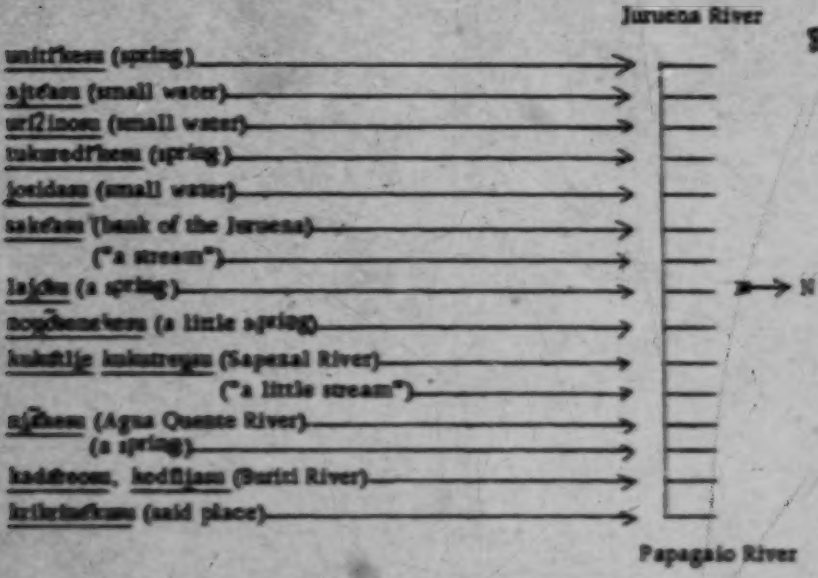
278 137 All the curares are not as simple as the Ñambikwara curare, but all appear to have as their principal base a species of Strychnos which varies according to the region. Certain Strychnos such as St. toxifera Benth., Str. lethalis Barb. Rod., and especially St. crevauxhiana Baill, are particularly toxic; others like St. pseudo-quina are very low in poisonous elements.

278 Besides the Strychnos, active elements of curare, of numerous other plants generally poisonous but with very diverse properties, and of animal substances such as venoms, often enter into the composition of this poison. Their addition answers different ends.

Sometimes these are resins or gums whose sole utility is to harden the product and to assure its preservation.

Sometimes they are toxic substances destined to reinforce or to complete the action of the Strychnos.

/221/ In other cases other substances without any actual effect but with magical properties are added to curare. Their nature is infinitely variable.



TRADITION

The Nambikwara have a sharp sense of tradition. We have read above (p. 50) a remark of Ri which shows him to be sadly cognizant of the decline of his race. Customs and techniques are generally considered as legacies of the "ancestors": [139] [[13 14]]

58. ketiõnu ikõtage ũʔtrige.
"The ancestors taught us how to coil it [the ribbon of rubber meant for making a ball]" (b1).

One single legend was found relating to the origin of the universe. [139] It is that of the Flood, the children' version of which we have already given. (1) Here is the text used by adults: 775 539

1. See above, p. 69.

59. nartõnu kõʔõtire
narukõtõtire nankanʔõnue
nahõtende kõtõ-rage nankõto uʔere tondige
the water had descended the water flooded Everyone to die

789 Poison is thus nãñde par excellence, although the latter can exist in other forms, at the same time less precise and more complex. We attach extreme importance to the fact that a rigorously utilitarian technique of the manufacture of poisons is found associated with a theory which accounts for their effectiveness through the intermediary of metaphysical concepts. The presence among the Nambikwara of a curare reduced to a basic product, and whose preparation excludes all ritual, associated with the very low cultural level of these Indians, poses in a particularly impressive way the question of finding out if these characteristics which are very primitive are so by origin or constitute the residue of an impoverished culture. Now, it is much more reasonable to interpret the apparent contradiction of theory [121 ●174] and practice in matters of poison by the loss of complex rituals which farther north are attached to the making of curare, than it would be to explain how a theory of supernatural character could have been built on the bases of treatment which has remained purely experimental, of the root of the strychnos.

Besides the notion of nãñde we should examine another which is the object of a particularly advanced elaboration among the eastern groups, that of the atũtu (al). Atũtu signifies animal, but the use of the term by the Indians is complex. First of all it is the animal taken in a generic sense, in opposition to the inanimate. They present me with a honey cake and, pointing out the body of a bee which is still in it, I ask what it is. They do not answer, "it is a bee" but: atũtu, "it is the animal." Atũtu also means real animals, but ones without their own names in the vocabulary, and which are of particularly fearful character. Thus oxen are called by this name by the Nambikwara who never saw any [99] before the years 1910-1915, and who entertain a great fear of them. Then we find the same term to designate the stars (eastern groups), and the same name is given to the ticktock of the clock, both conceived of as realities animated by mysterious characteristics. Finally, atũtu is a special animal of supernatural essence, which is seen appearing in two cases—at night, on the road, in certain places and during certain periods, and upon the approach of death. In the first case, one risks being attacked and killed by the atũtu if one does not defend oneself 789 in the appropriate manner. This means is found in the throwing stick 411 (kaiku) (distinct from the digging stick), thrown in a prescribed manner. The throwing stick, a large piece of wood of flattened form [284 and pointed at the end is furnished with a handle usually decorated 539] with black and white bark weaving (javelin: hi'dem [al], kahãjere

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

171 The objection may be raised that the old authors have interpreted inaccurate observations in the light of European data. Since we shall suggest the use of the word *compérage*—borrowed from the French—to identify the institution, which we consider to be an authentic aboriginal one, it will be useful to discuss briefly this aspect of the problem.

Without any doubt there is a striking analogy between the facts related above and the Latin-European institution of compérage. Originally the *compère* and the *commère* were connected with each other, and both with the child's parents, through the mystical link of parrainage. However, the relation was very soon secularised in all small rural communities, or rather, wherever the familial structures were of greater importance than the social ones; it was then used to establish an artificial link of kinship, or, more precisely, as is the case among the Nambikuara, to express in kinship terms a purely external relationship of spatial promiscuity.[5] The stranger or newcomer was adopted by means of the reciprocal appellation of *compère* or *commère* which he received from—and returned to—his male adult contemporaries. On the other hand, since the stranger usually assimilated himself to the group by marrying within his new community, the terms *compère* and "brother-in-law" soon became synonymous, so that men allied by marriage usually called each other only by the first term. In all small communities of Mediterranean Europe and of Latin America, the *compère* or *compadre* is an actual or a potential brother-in-law. No doubt in certain regions of Central and South America the analogy between the European and aboriginal institution has helped the latter to become fixed and modernized. Thus, in Mexico the primitive institution of the *molle*, that is, of the heads of families bound to exchange gifts at certain periods, now expresses itself by means of the "compadre" relationship, the Spanish term providing an easy translation of the earlier Otomi.[6] The formal analogy between the institutions cannot hide, however, the fact that they are really opposite in character. In Latin-Mediterranean society, the formerly mystical and, actually, social link of compérage may be changed, through marriage, into a real kinship tie. Among the ancient Tupi, as among the Nambikuara, the actual kinship provides the type of link used to establish wider relations.

174 171 174 This being admitted, there are two strong reasons why our authorities cannot have constructed a pseudo-institution based on a European pattern from inconsistent observations. In the first place, men as well acquainted with religious problems as were Yves d'Evreux, Cardim and Léry could not have assimilated a relationship whose first consequence and probable aim was to per-

[5] The same sociological distinction is expressed in English through the etymological origin of the word "gossip" (*god-sib*).

[6] Jacques Soustelle, *La Famille Otomi-Pame du Mexique Central* (Paris, Institut d'Ethnologie, 1937).

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

mit new forms of marriage to the relationship between godfathers and parents, the main purpose of which, especially since the thirteenth century, had been to impose new and very rigid restrictions upon marriage. At the time they were writing, the matter was of immediate interest and was being discussed by the Council of Trent, where the earlier rules were somewhat mitigated. But there is a much stronger argument: From the moment of the arrival of the European missionaries both institutions, the European and the aboriginal, actually coexisted among the Indians, at least among those who were baptized, and neither they nor their European priests ever interpreted the Christian "god-father" relationship in terms of the native "brother-in-law" institution. On the contrary, and much more logically, since the new relationship placed restrictions on marriage, they considered it as a modality of the relation of paternity; thus, they assimilated the "god-father" to a classificatory "father."

> They [the newly baptized children] regarded their god-fathers as their true fathers and called them *Cherou*, that is to say, "my father," and the French called them *Chemire*, that is to say, "my son," and the little girls *Chemire*, "my daughter." . . .[8]

Therefore, it cannot be doubted that the *couvade* is quite distinct from its European parallel.

A sufficient number of convergent indications have been recorded so that we may consider the outstanding character of the "brother-in-law" relationship a specific feature of South American sociology, constituting the core of an original institution of *couvade* which appears clearly among the Nambikuara and which, as suggested by the documents presented in this article, may formerly have had a much wider distribution on the continent.

[284] Some items in the collection are of special interest because they document the process of material acculturation. They consist on the one hand of objects that incorporate iron found by accident in the tracks of [Fig. 20] hunters and rubber gatherers; and on the other hand of imitative artifacts, made with the unskilled hand of a primitive people desirous of copying the products of a more advanced industry and the forms of a superior art.

[285: full page of figures.]

[286][Fig. 21] An instance of such imitation is provided by several diadems which crudely attempt to copy similar ornaments found among the Nambicuara; the latter are obviously alien objects plundered from northern tribes, where featherwork has reached a higher development.

[Fig. 68]

They have learned to appreciate the advantages of our hats [287] and prize them highly. An unhappy Indian who had not received one as a gift attempted to make one for his own pleasure, plaiting and adjusting bacaba leaflets...

Chapter XI

Conclusions

177 [307] It is not possible at this time to attempt a definitive synthesis of Nambicuara ethnography in relation to other tribes.

If we could distinguish in Brazil the two classical periods (Paleolithic and Neolithic), the Serra do Norte Indians would be included in the former: their axes are crudely chipped and their culture resembles the characteristic Paleolithic pattern. (1)

1. Diagramatically and in relation to their neighbors, the Nambicuara recall the Paleolithic peoples; but their culture, with its rudiments of agriculture and weaving and its crude

but smooth-edged axes, is more akin to the proto-Neolithic or transitional period. The present trend is to recognise in the New World Paleolithic industries . . . but no formal overlapping periods as in Europe. (R. L.)

A later footnote by Heloisa Alberto-Torres which is not reproduced here contains the following statement: ". . . an interesting ethnographic relationship is [established by] the absolute identity of Australian and Nambicuara axes . . ." (Ed.)

At first observation, the Nambicuara might seem to be an old and backward branch of the Parexi tribe.

[308] What we know of the physical anthropology, ethnography and linguistics of both groups, however, invalidates this supposition.

177 Yet their culture bears unmistakable signs of Parexi influence.
[46] The first is the beehive-shaped house, formerly built by the Parexi. This is an import among the Nambicuara; the original house of the Serra do Norte Indians is the screen of leaves and branches, similar to the kiême of the Botocudo (Windschirm of the German ethnologists) and reminiscent of the North American wigwam.

[Fig., p. 61A]

[308] And if they did not borrow the large "round house" from the Parexi, they adopted it from Bolivian Indians.

[49] Another instance of alien influence is the nose plume, which the Parexi do not wear now but which formerly, according to Antonio
177 Pires, they could not do without; and also the nose flute, which
594 [the Nambicuara] play unskilfully, as though it were a little-known instrument of yet unfathomed secrets.

The double flute seems to have been brought from the north. It must be an import from the Mauê and Mundurucu, with whom the Serra do Norte Indians had serious clashes as already mentioned above.

7:Roquette-Pinto--62 E-4, 5 (no date)1938 SP17 Nambicuara SP17 (ca. 1912)

[Fig. 70]

177 Their plaiting follows patterns clearly characteristic of the [255] Xingu (Trumai and Nahuqua) and gives proof of contact with those backward tribes which the rudimentary culture of the Nambicuara had already implied.

[255] The quadrangular barbecue, which differs from the usual pattern, is used only by the more advanced groups (Tagnani, etc.); it recalls the barbecue of the Javahe as depicted by Fritz Krause. (1)

1. F. Krause, In Den Wildnissen Brasiliens [In the Brazilian Wilderness] (Leipzig, 1911).

[256] The straw ornaments of the Nambicuara are quite similar to 177 those of the Saya. But linguistic affinities are even more indicative of contact between the two groups. No other people speaks a dialect [310] so similar to that of the Nambicuara in terms of word morphology, although the two languages are otherwise quite different.

171 It is interesting that a spontaneous affinity should arise be- 177 tween two remote and equally primitive tribes, the Guayaki of Paraguay and the Nambicuara of the Serra do Norte, from their common use of the jaguar hide helmet.

However, I am inclined to believe that the latter copied it from their neighbors, the Cayabi of the Parananinga River, who use helmets of the same material.

174 Unfamiliarity with the banana tree and with the pipe (an ob- 171 ject frequently encountered in North American mounds and Brazilian sambaquis) indicates how long the Nambicuara have been established in their mountain range.

Recognition of the Ge-Botocudo group as one of the oldest representatives of aboriginal South American populations is no longer a matter of dispute. . . . . .

171 [311] There is no doubt, in my opinion, that the [Brazilian] linguistic groupings correspond to ascending stages of civilization [312]. . . . . The Serra do Norte is inhabited by a people of Ge culture evolving toward the Nu-Arawakan culture, of which they have barely reached the initial stages.

FAMILY AND SOCIAL LIFE OF THE NAMBIKWARA INDIANS

by

C. Lévi-Strauss

INTRODUCTION

101 The name of the Nambikwara appears in ethnological literature from the eighteenth century on; but it seems useless here for us to [114] compile references reduced to a more or less distorted citation of the tribal name and to the approximate indication of the territory occupied by the group. In fact, with the exception of the name, which seems to be a surname of Tupi (1) origin, the Nambikwara remained

1. Cf. below, page 129, footnote 1.

practically unknown until the time of their discovery in 1907, by General (then Colonel) Candidio Mariano da Silva Rondon. From this date on, we are directly or indirectly indebted to the Rondon Commission for all the information available concerning them.

105 It is known that in 1907 Colonel Rondon was given a commission by the Brazilian government to explore the territories which extend approximately 1, 500 kilometers from the village of Diamantino to the Madeira River. This was to precede the construction of a strategic telegraph line connecting the federal capital with the frontier outposts of the northwest. In the course of a first expedition begun in 1907, Rondon succeeded in reaching the Juruena, principal source of the Tapajoz, unknown up to that time. This discovery took place the twentieth of October. A second expedition, begun in 1908, permitted the opening of a land route toward the Madeira. This was the first objective of the mission entrusted to General Rondon which 177 was realized on December 25, 1909. It was during these two expeditions that contact was established for the first time with the Nambikwara.

The laying of the telegraph line continued through the Indian territories from 1909 to about 1915. During this period and since, there have been regular, although intermittent, relations between the Indians and the members of the telegraph commission--construction

officers, soldiers /2/ and workmen. These contacts have continued since the completion of the work. They are always intermittent and are made especially by the stations whose service is assured by the Pareesi Indians educated in care of the Commission.

Leaving aside several books and articles of anecdotal character written by certain collaborators of General Rondon, we are limited to the following works as the only sources of information concerning the Nambikwara Indians. First, the Rapport ethnologique, by General Rondon himself, and printed in Rio de Janeiro as one of the numerous official publications of the Commission under No. 2, 1911. Next must be cited the lectures of the same author which followed the Roosevelt-Rondon expedition to the Rio da Duvida (Portuguese edition: Missão Rondon, Rio de Janeiro, 1916; English edition: Lectures delivered by General Candido Mariano da Silva Rondon, etc., Commissão Rondon, Publication No. 43). Recourse should also be made to an article by a young officer of the staff of General Rondon, Antonio Pyrineus de Souza ("Notas sobre os costumes dos Indios Nambikwaras," Revista do Museu Paulista, Vol. 12, 1920) and to the information scattered in the diverse reports of the Commission, published during and after the exploratory work, of which the most useful is doubtless that of Cartier (Rapport géologique et ethnologique, No. 23, Annexe 5). Some information will be found in the book of Theodore Roosevelt (Through the Brazilian Wilderness, Works, Vol. 6) and a short vocabulary in Max Schmidt ("Ergebnisse meiner zweijährigen Forschungreise in Matto Grosso," Zeitschrift für Ethnologie, Vol. 40, 1929).

In 1912, the Director of the National Museum of Rio de Janeiro, Dr. Edgar Roquette Pinto, was authorized to join the Rondon Commission in the field to receive, examine, and report to the Museum the ethnographic collections made since the beginning of the work. This trip must have given Dr. Roquette Pinto the occasion to write and publish several articles and a book. Certainly the most important of the former is his communication to the International Congress of Americanists held in London in 1912 (Os Indios Nambikwara do Brasil Central); then, his communication to the Pan-American Congress at Washington (1917) under the title, Os Indios da Serra do Norte. The book, Rondonia (last edition: Cia Editora Nacional, Sao-Paulo, 1935) is almost entirely dedicated to the Nambikwara and represents our best source of information.

For about seven
221 months these bands go wandering across the prairie in search of small
[220] game, small animals such as caterpillars, spiders, grasshoppers, rodents, snakes, lizards, and so forth, and fruits, grains, roots or wild honey--in short, all that might keep them from dying of hunger. Their camps, set up for one or several days, sometimes for several weeks, consist of as many temporary shelters as families, made of palms or branches stuck in a semi-circle in the sand and connected at the top. This is the period when the quest for food absorbs all activities. The women equip themselves with digging sticks and
221 411 184 the men hunt with the bow and arrow, of which several types must be distinguished. The eastern groups have a bow with a flat section which evolves toward a convex-plane section or a concave-convex section when one moves westward. As for the arrows, those made for hunting birds have a blunted tip. Arrows for fish have three to five points, each one formed like a minute harpoon, and the item is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 95.

by a sheath of bamboo, are reserved for hunting monkeys and small game. Those for large game have a long lanceolate point. The barb is attached or sewed on. Besides the bow and arrow, the men use a club
[189] which often takes the form of a javelin, and its use is reserved for magic and war operations (1).

1. Cf. below, p. 99.

824 The primary materials of the indigenous industry consist of varied
825 woods, wax from wild bees, resin, fibers of the buriti palm trees (Mauritia vinifera) and tucum (Astrocaryum tucuma) bone of the monkey, teeth and claws of mammals, fur (only to make ornaments), feathers, quills of porcupines, vegetable shells and river shells, stones,
412 cotton and grains. As implements they have knives made from a sharp piece of bamboo, from stones crudely fashioned, or from fragments of iron or steel obtained through exchange, and fixed with the aid of wax and cord between two pieces of wood forming the handle. Drills are made of a borer of stone or iron mounted at the end of a stick
[77] which they turn between their palms. The Rondon Commission expanded the use of axes and metal hammers, and the old stone axes serve now only as small anvil blocks for fashioning shell or bone.
[115] The use of stone polishers must also be mentioned and, among the objects of current usage, the spindles, combs, baskets and gourds to carry water.

601 184 Grandparents are most often singled out among themselves, and distinguished from the parents of the spouse, which does not happen in system a (1 or 2): also, the son (or daughter) of the brother (or the of the sister) of the father (or of the mother) are sometimes designated by different terms. The groups studied are not dense enough to be able to make a base for a theory of the system in force. Solutions of replacement intervene frequently, and the preferential forms of marriage found are not adequate for generalizations, due to an insufficient number of cases. But the preceding considerations suggest that preferential unions, choosing also among certain categories of cross-cousins, could formerly have been in force.

[173]

Finally, the names for brothers (and sisters), elder and younger, are more changeable than in system a (1 or 2): and one sees appear a new term designating the brother or the sister of the other sex. This disorganization of vocabulary can be interpreted as resulting from the influence of the northern system (dialect c), where we shall see later on that it tends more and more to assimilate the system of groups b.

Here is the vocabulary of parentage used, with references to group a (1/2): [Note: m. s. = man speaking; w. s. = woman speaking; m. w. s. = man or woman speaking.]

Dialect a 1/2		Dialect b 1/2	
abuĩ'nosu	1.	(ta)mĩ'nde	(my) father, father's brother.
	2.	ĩnde	father (equals man).
	3.	usĩye	father (used to designate absent father, or father of a third person, or the father's brother.
	4.	(ta)mĩ'nlaore	father's brother (equals other father).
	5.	(ta)minddĩnere	father (father's brother when he substitutes for dead father).
aʒũnosu	6.	(ta)nãde	(my) mother, mother's sister.
	7-8.	(ta)nãdelaore, ndãore	mother (other mother; for the mother's sister and the mother of a third).

551 scrapes it to eat it. Brother! Scrape!"

551 The Indians feel very strongly the inconvenience of the system,
●177 especially when they are in contact with the whites. Those among them who intermittently frequent the posts of the Rondon Line have very rapidly adopted the Brazilian names which they hear pronounced around them, and they are—or have been—baptized Julio, José Maria, Luiza, Iracema, etc., giving these surnames some strange distortions. Sometimes too, there are nicknames like Lebre (lièvre = rabbit), Assucar (sucre = sugar) or Cavaignac (the shape of beard worn by the famous general). Several Indians have preserved this last name, thus perpetuating in the backwoods the memory of the time when Rondon lived and flourished.

We could use these names to designate them in the course of this study, or also their real names insofar as we have been able, in certain cases, to restore them. But these Brazilian names are only carried by the small minority of Indians who are in contact with the posts of the Rondon Line; [38] and the authentic names are lacking to us in a great number of cases. At any rate, the process would not be true to reality. For the remarkable point is that, in daily life, one does not hear a single name pronounced. It thus seems to us more in
128 conformance with the indigenous atmosphere to refrain, in the course
551 of this work, from using names to designate individuals, and we shall content ourselves with symbols indicating the sex, the group, and the place in the group of the individual considered (for each group, respectively A, B, C; capital letter for a man, small letter for a woman, followed by a figure identifying the subject.)

551 Nevertheless, as has just been indicated, it has been possible for
124 us, for group a1, to collect a complete list of names. This is how: one day when we were playing with a group of children, one of the little girls was struck by a playmate. She came immediately to take refuge near us, and began, in a very mysterious manner, to murmur something in our ears which we did not understand, and which we were obliged to have repeated for us several times, so that the adversary realized the trick, and, apparently furious, came in turn to reveal what appeared to be a solemn secret. After several hesitations and questions, the interpretation of the incident left no doubt. The first little girl had come, out of revenge, to give us the name of her enemy, and when the latter saw this, she told us the name of the other one, as a means of reprisal. From this moment on, it was very easy, if not very scrupulous, to arouse the children against one another, and to obtain from each of them the name of all the others. After this, a little complicity thus having been created, they gave us the

531
212

Besides, they called the act of writing: iekaritukeditu (a1), that is "make lines," which for them had an esthetic interest:

(3) Kihikãgnare mãiene (b1).
It is nice to make lines.

•[177] The drawings reproduced in Figure 19 thus constitute a cultural innovation inspired by our own drawings.

622 confers; also [41] he asked us for a note pad and a pencil, and we
115 are likewise equipped when we travel together. He does not com-
157 municate to me verbally the information that I ask of him, but traces on his paper some wavy lines and presents them to me as though I should read his response. But he himself is half duped by his comedy. Each time that his hand finishes a line, he examines it anxiously, as if the significance should miraculously spring forth, and each time, the same chagrined disillusion is painted on his face. But he doesn't give in. And it is silently understood between us that his scrawl possesses a meaning which I pretend to understand. Naturally, the verbal commentary follows almost immediately, and excuses me from having to demand some very necessary clarifications. When we discuss command, we shall return to certain aspects of this semi-mystification.

He is a valuable informant who understands the problems, perceives the difficulties, and is interested in the work; but his functions absorb him often, and he disappears for whole days on a hunting expedition, a survey of itinerary or a localization of ripe seed or fruit trees. On the other hand, his wives often call him to tender love games in which he lets himself be voluntarily involved.

In a general way, his attitude shows a logic, a continuity of purpose, very exceptional among the Nambikwara who are often unstable and temperamental. Placed in other conditions and with other means at his disposal, he might be a valuable organizer. And he is, after all, alone responsible for the destinies of his group, which he conducts with competence, although in a sometimes utopian spirit.

The father and the mother of A1 are dead. But his father's brother and mother's sister, whom he calls ahuĩnosu and ãĩlenosu live in the same village (A65 and a66).

115 a2. --About 30 to 35 years. The eldest of the wives of A1, mother of a5, daughter of a18 and a now dead father. She is serious industrious, a little reserved in social relations. In the triple household

621 comment later (1) on the complex motives that might have induced

1. Cf. p. 77.

[47] these two bands, speaking different dialects and who were not even capable of understanding one another without an interpreter, to practically merge. It seems that group b1 was composed of the rare survivors of a formerly important formation now disappeared, living previously in two distinct groups, around the sources of the eastern tributaries of the Roosevelt River. We have already tried to calculate these losses, resulting from recent epidemics (2). Group c had,

2. Cf. above, p. 6.--

[57] without doubt, gone through the same hardships. Moreover, its position had been compromised by antagonisms with other bands rising from the same dialect, and who had formerly been their allies. A visit, with a commercial goal, of related Indians originally from the south (members of the group known by the name of Kabixy) must have raised the forces of group b1 to 31 persons for
621 several days. Here is its composition at this moment:
115 Fire 1 (1 to 7). --The family of the chief of the band. The
157 chief, B1, is 30 to 35 years old, and one of the most intelligent
622 Indians whom it was our privilege to encounter. But he is intelligent
601 in a way very different from A1. The latter is prudent and very resourceful, always meditating some political combination. On the contrary, B1 is not a man of action, but rather contemplative, with a charming and poetic spirit, and rich sensibilities. He is fully conscious of the inevitable decadence of his people, and this conviction often shades his words with a subtle tint of melancholy:

(4) joɔ̃ndiɔ̃ɛ̃ : ɲãɔ̃naɲe hẽni niho ãɔ̃ndedɲiɛ̃n. (b1)

"I also did the same thing, now it is finished," [51] he says, remembering happier days when his group, far from being reduced to a handful of individuals incapable of keeping alive their traditional customs, was comprised of several hundreds of participants faithful to all the manifestations of the Nambikwara culture. His curiosity toward our customs and towards those which we had been able to observe in other tribes is just as great as ours. With him, ethnographic work is never unilateral. He conceives of it only as an exchange of information, and what we bring him is always very welcome. Often
[17] he even asks us for--and preserves carefully--drawings representing

621 feather ornaments, hair styles, arms, such as we have seen among
115 neighboring or faraway peoples. Did he entertain the hope of per-
157 fecting the material and intellectual equipment of his group thanks
622 to this information? It is possible, even though his dreamy tempera-
177 ment hardly ever drives him to realizations. However, one day when
601 we were interrogating him concerning the Pan pipes, to verify the
area of diffusion of that instrument, he answered that he had never
537 seen any, but that he would like to have a drawing (different from
group a, group b does not have real pipes of Pan, but instruments
made of two or three tubes of equal length and giving approximately
the same note, tied together with cotton thread and wax). With the
aid of our sketch he succeeded in making a crude but usable instru-
ment.

621 B1 had two wives: b2, about 25 years, mother of two little
601 girls of 5 to 7 years, b4 and b5; and b3, older than he (about 40
years old), mother of a boy of 7 years, B6, and of a girl of 9 years,
b7.

Fire 2 (8 and 9). --A son of a deceased brother of B1, whom the
latter then calls "son" (about 25 years old), and his wife about 18,
sister of B13; no information about the father and mother.

Fire 3 (10 to 12). --B10 is a brother of B8, and B1 calls him "son"
also. His wife, b11, of undetermined parentage, is about 20 years
old, and his daughter b12 about 6.

Fire 4 (13 and 14). --This household presents the only sure case of
oblique marriage in group b1. B13, about 25 years, married a girl
of 16 or 17, b14, daughter of a dead son of the dead brother of B1;
he calls her then, as seen before, tasuite.

Fire 5 (15 to 17). --These three individuals are the last survivors
of a related group destroyed by an epidemic. After the disaster,
they joined the band of B1. B15, about 35 years, is the brother of
b2, thus tarute of B1. His wife, the same age, b16, is a sister of B1,
thus ndedere of b2. Their son, B17, is about 5. The daughters of
B1 call him (B17) "husband," and he calls them "wives."

621 [52] The visitors. --They came from the region lying between
574 the sources of the tributaries of the left bank of the Juruena and of
601 those of the right bank of the Guaporé. All were related to their
hosts, and were distributed among three generations. The oldest was
comprised of three individuals: B18, about 50 years old, father of
B21, B25, B27, and B29; his wife b19, the same age, paternal aunt
of B1; and the brother of the wife, B20, 40 years. Besides the
children of B18 already mentioned (from 20 to 30 years old), the next

Fig. 19
Left: a man; center: a monkey; right: sketch made by Al while explaining his genealogy (c. p. 40, fn. 1).

The fact is that purely comical and sometimes childish appearances sometimes cover attitudes which, without being contradictory to the preceding, are nevertheless very different. The history of the eastern group, in the course of [124] these last years, is very significant in this regard. From 1909 to 1920, the installation of the telegraph line was marked by periodical conflicts alternating with cordial contacts, but in 1925, seven workers of the line were invited to visit (for the first time) the villages of the right bank of the Juruena River where we went later in 1938, and they disappeared there. From this time on, the contacts of the eastern group with the posts of the Rondon Line were interrupted, but in 1933 a Protestant mission was installed not far from the post on the Juruena. It seems that from the beginning relationships were quite strained, the Indians not being satisfied with the presents, very insufficient, they say, by which the missionaries paid for their help in the construction of the house and the planting of the garden. Whatever the case may have been, in 1933 a feverish Indian presented himself at the mission, and publicly received two capsules of "Cafiaspirin" which he took, after which he went to take a bath in the river, had a congestion and died. Through expert practitioners, the Nambikwara concluded that he

Lévi-Strauss--143 E-5 (1938-1939)1948 SP17 Nambicuara SP17

had been poisoned. An attack of reprisal was carefully prepared and took place, in the course of which A1 and A5 distinguished themselves. The six persons composing the mission were killed by beating or pierced with arrows, including a baby of two. Only one woman was found alive by an expedition sent to aid them from Cuiabá. The version which she gave of the events coincides exactly with that which we collected from the main protagonists of the other camp.

Poison was still to play a role in the life of A6, and this during our stay. We found ourselves visiting (August 1938) at the camp of a neighboring group (n2), and relationships became quickly strained between A6 and our hosts, undoubtedly over the question of women, so that he got the habit of coming to my camp to seek a more friendly atmosphere, at the same time that he shared my food. This fact was noticed, a delegation of four men came to find me one day, and in quite a menacing tone of voice told me to mix some poison (which they brought me along) in the next dish which I would offer to A6; they thought it advisable and indispensable to do away with him at once, for, they told me, he is "very wicked" (kakore) and "is worth nothing" (ajokiene). I had the greatest difficulty in getting rid of my visitors without opposing them with a refusal which in turn would have exposed me to animosity which I had just learned it was better to avoid, and I considered my best plan of action to exaggerate my ignorance of the language, and to feign obstinate lack of comprehension. After several attempts, my visitors retired very disappointed. I warned A6 who immediately disappeared. I was to see him again only four months later.

These incidents are characteristic of Nambikwara psychology. The Nambikwara are very open, confident and spontaneous, but they are very sensitive and react with great violence to deception [125] or disappointment. Few primitives are as easily accessible. Few give as free access to their intimate lives, to their beliefs, daily acts, thoughts and sentiments. But despite this facility and cordiality, the visitor, be he an ethnographer or a member of a neighboring tribe—must constantly be on guard and watch his actions; for the slightest imprudence, the least clumsiness, may incite reactions difficult to evaluate among his hosts, and in connection with which recent events are always present to recall that they may be extreme. A6 offered a perfect example of this confidence and spontaneity, allied with brusk manifestations of violence and irritability.

Thus, the Nambikwara character alternately presents two aspects, or more exactly, testifies to a double nature: one which we shall call positive, and which goes much farther in this sense than among many Indians in contact for centuries with the whites; and the other, of metaphysical nature, whose rigor and exaltation at times evoke the mysticism of the North

Lévi-Strauss--144 E-8 (1938-1939)1948 SP17 Nambikwara SP17

American Indians. As example of the first aspect we shall mention: the public and "scientific" preparation of the curare; the development of certain therapeutics such as the treatment of ophthalmia by instillation; the flexibility of the sexual division of labor; sexual life in general; the atmosphere of the rites of abstinence; the rational attitude as regards alimentary taboos. Several remarks on this point will make clear the indigenous psychology. The white worms (anambu, a1) which are frequently found in the nuts of the bacaiuva palm have been indicated as being inedible. Subsequently we verified that they were eaten in secret by the children. Thus a8 finds them while cracking nuts and gives them to her little sister a9; and furtively the too eats a worm. Her action is noticed by a3 and a4 who cover her with sarcasm. However one day when food is scarce, A1 eats a plate of worms which his young wife a4 has gathered for him, and sadly remarks that, due to lack of meat, he is reduced to this poor fare. The same observation is made about the hawk. Above we showed what constitutes the metaphysical basis of the alimentary taboo concerning the jaguar. However, the current interpretation is entirely different:

66. xiatedeinã? xũi?e (b1).
I don't eat any of it. It smells bad!

In the face of new situations, the Indians generally react without mysticism. Thus, A1 before the problem of writing: (1) on the other hand,

1. P. 40 f. and p. 89.

the Nambikwara show total indifference toward photography, even when they have understood its purpose. We have never found [126] Indians who tolerated the participation of the camera in the slightest details of their intimate life with such complete indifference.

However, the passage to irrational positions is made with the same brusqueness which characterizes the two attitudes, almost simultaneous, of an infant hilarity before the still unusual sight of an inflated balloon which burns, and of an appeal to evil magic when a second balloon succeeded in rising. (1) Never does the tender indulgence with which the men surround

1. P. 97.

their companions (2) allow one to suspect the actual metaphysical curse

2. P. 86 f.

with which the women are burdened in the Nambikwara culture, excluded under pain of death from collective ceremonies, deaf and blind to the voice

2: Lévi-Strauss E-5 (1938-1939)1948
5P17 Nambicuara 5P17

When rains come, the *Nambicuara* settle in temporary villages, and the men open circular gardens in the gallery forest by burning and felling the trees with stone (now steel) axes. They till the soil with pointed sticks and raise both bitter and sweet manioc, several kinds of maize which are different from those of their more civilized neighbors (Roquette-Pinto, 1938, p. 297 n.), beans, gourds, cotton, urucú, and a variety of small tobacco with tiny leaves. Despite the difficulty of fishing in the deep, clear tributaries of the Juruena River, they have moderate success using fish arrows, basket traps, and a drug made of a vine.

Food preparation.—Game is usually only half cooked in hot ashes, but it is sometimes smoked on rectangular or pyramidal balsacuta. Manioc is grated on thorns of the cutiuí palm (*Iriartea* sp.) imbedded in palm wood planks. To remove the poisonous juice of bitter manioc, the pulp is either squeezed in a strip of bark twisted spirally or buried for several days to allow the juice to drain off. Balls of the pulp are then sun-dried and packed in leaves in baskets or buried at marked places. In times of scarcity, perhaps months later, the half-rotten balls are made into flat cakes, hastily cooked in hot ashes, and eaten.

The *Nambicuara* cannot bear to eat salt, which they do not know how to prepare, or pepper, which they do not cultivate. Even hot food is cooled with water before it is eaten. Wild honey, too, is diluted with water. The only condiment is a variety of cumaré bean which has a strong, bitter almond taste. It is boiled in pots; afterward the liquid is drunk and the beans are mixed with food, especially with grasshoppers crushed in mortars. Armadillo meat is often ground with maize flour.

Domestic animals and pets.—The *Nambicuara* have many pets, especially monkeys, coatis, parrots, and birds. Domesticated animals were unknown until the Rondón Commission introduced chickens and dogs. Although at first extremely afraid of dogs, the Indians quickly adopted them and treated them with the same deep affection they show all their tame animals. Even now they are terrified by oxen seen at telegraph stations, and call them by the name given to the deadly spirits of the water and the bush. They do, however, hunt and eat horses and mules as if they were wild game.

HOUSES

The surprising variety of house types suggests recent borrowing from neighboring tribes. The *Nambicuara*, like the *Siriono*, may formerly have lacked houses entirely. During most of the year, even at the present time, they build only scanty temporary shelters for a single night. These consist of branches of palms stuck into holes dug in the sand to form a half or quarter circle on the side from which the sun, the wind, or rain are expected (pl. 37, *center, left*). Each individual family builds its own

The Wak[illegible] [illegible] do not
323 make pottery, but they sometimes acquire pots from the Parecsi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Waikisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except 584 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following [182 and carrying a burden basket on her back and a baby strapped on her hip, an older child following 459 her. As they move slowly along they collect 222 fruits, nuts, insects, snakes, ants, lizards, rats, wild honey, and a great variety of grubs or larvae. 226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them catching fish that were only 2 inches in length. [252 These were later thrown on hot coals and eaten 262] without being cleaned. Small birds no larger 223 than a sparrow are shot if the man can get near 222 enough to use his bow and arrow. If they come [347] to a burití stalk of the right size they will cut it down, put it into the burden basket, and take it 313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally [177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

Kingi, the Nambicuara tinkl fishing appears very elementary. The small fish are wrapped in leaves and placed in hot ashes until cooked. Large fish are broiled on a halmount. The Nambicuara also claim that they fish at night with torches along the river banks. This method may have been taken over from the Brazilians.

AGRICULTURE

The principal food crops grown by the Nambicuara are bitter manioc, sweetpotatoes, arrowroot, corn, maize, beans, and peanuts. To this list we must add such nonfood crops as cotton, tobacco, urucú, and gourds. The scientific and native names of these plants are listed in Appendix 1.[1] In more recent times they are known to produce sweet manioc and sugarcane. The dependence upon food crops in relation to game, fish, and wild food plants is difficult to gage. The statements of missionaries, however, appear to indicate that cultivated crops do not provide a year-round food supply and may actually play a minor role as compared with dependence upon noncultivated resources.

Farming is done on the slopes of the "galeria" forests, where, as we have seen, they also do most of their hunting and collecting. The Wakitáiu band clears and cultivates a single field and, as we have said, lives in a single house while thus occupied. In the past the field (kaíbu) was cleared with a stone ax (stóru) and a wooden club (kabutéiru). Today steel axes and machetes are used, but the method of planting is still the same. The efficiency of steel tools over stone axes and wooden clubs is indicated by the statement that in the past when a new field had to be cleared the people had to work during most of the wet season in order to fell the trees, a task which they now perform in May and June.

Formerly the light undergrowth was pulled out by hand and the bushes and saplings were beaten down with the wooden club. The Nambicuara had a unique way of felling trees. Starting near the bottom of the slope, they cut all the small trees part way through, then selected a number of large trees as kingpins. When these large trees were felled they knocked down the smaller trees below them. This was continued until they had a circular clearing of the required size on the slope. Today the clearing is done with axes and knives,

[1] [Cal. 116, pp. 121-126.—Eds.]

252 The Nambicuara method of processing manioc in comparison with that of the Canayurá is simple and crude. The following describes the method used today: Marciano's wife dug up a burden basket full of manioc from a field belonging to the Protestant Mission. She sat under a tree and peeled the tubers with an old butcher knife (formerly a piece of bamboo was used). She washed the peeled tubers and placed them in a calabash. She then took a grater made from a piece of kerosene box about 2 feet long and 6 inches wide to which an 18-inch strip of perforated tin was nailed. She placed one end of the grater in a larger copper basin (belonging to the mission) while the other end rested on the edge, and while steadying the grater with one hand she grated the tuber with the other. The tubers did not stand in water nor were they dipped in water during the process of grating.

[171]

After the tubers were grated she dipped out a calabash full of mash and began pressing it with her hands and pouring the juice into another calabash. After she had drained off as much juice as possible she picked up a handful of mash (*wiiwaru*) and rolled it and squeezed it until no more juice could be expelled. This ball she placed in another calabash and continued making balls until the calabash was full. She then patted down the balls to form a round loaf about 10 inches in diameter and 4 inches thick, which she set out on the bare ground to dry in the sun. After several days in the sun these loaves got hard and dry and form the storable product (*kinakáingare*) from which the edible cake *hi'inirv* (also called *wailáwa*) is baked. The juice (*oyáwa*) which was left in the calabash she poured into a slight depression in the ground, and after the liquid had drained off she collected the thin film of starch flour (*akuinirv*) along with some sand, rolled it into a ball, and placed it in hot ashes to bake. The lack of pottery vessels prevents the Nambicuara from saving and boiling the juice. They know, however, that the juice is valuable, and when they have cooking vessels they boil it to form a thick porridge.

[251]

[415]

When the Nambicuara wish to prepare a greater quantity of pulp they use a piece of bast for a press. This is a piece of embira bark about 3 feet long and 8 inches wide called *sáru*. A woman rolls a ball of pulp in the strip of bark and twists the bark until the pulp is dry. The balls are then

[p. 91(2)]

412 415 in her burden basket, whereas the modern axe, knives, and other tools, along with his ornaments, the man carries in a similar basket, or he straps this basket on the back of a boy while he walks in front of the file carrying his bow and arrows or gun ready to shoot whatever game is met along [264] the way. Whenever they kill some animal or catch a few fish and feel hungry they stop and prepare a meal. During the dry season they are at home anywhere in their land territory, moving only when hunger spurs them on.

411 412 ●177 Today, of course, the Nambicuara have steel axes and knives. The heavy equipment of the Wakitênio band in 1948, consisted of three axes, two shotguns, and some half dozen bows which were hidden near their permanent house. Each man had a butcher knife, but all men did not have bows and arrows. There did not appear to be any desire on the part of each man to possess these implements. So long as the band had a few of these objects everyone seemed to be satisfied. Cassimão, a widower when he arrived in Utiarity, did not possess a bow and arrow, nor a gun, nor an ax. By working for the Protestant missionaries he acquired an ax and when Marciano died he inherited his bow and arrows. After a [#31] few days, however, he had given the bow and arrows to a Brazilian in exchange for a felt hat.

412 Examining the hand tools which Julio used, the following articles were found: A chisel (kwatiru) made by inserting a piece of steel into a wooden handle wound with twine; a small bamboo [306] knife (sikikwirikuta); a hardwood drill (kôkuta), used with sand for perforating tucum nut shells in making beads; a piece of sandstone (dôkipiru), used as a whetstone; a number of rough leaves of the lixeira tree (kôr'ôsuta), used as sandpaper; and a 415 comb (ka'dôsta). Each of Julio's three wives had a burden basket, a small square basket, and two or three gourd vessels of various sizes. A single wooden mortar and pestle did service for the whole band.

411 One of the most important implements of the Nambicuara is the bow, kôkiru, made from the piuva (jacaranda-copaia) or the sirva palm (*Syagrus species*). By far the most common is the bow made from piuva, ranging between 6 and 7 feet in length, flat on the inside and convex on the outside. One of the bows examined measured 2 meters and 14 cm. in length, 4 cm. in width, and 1.5 cm. in

283 breaks down. After one-half hour the starchy material is washed out and the ribbons begin to separate into fine strands of fiber. The bunch is then shaken out and hung up to dry. When of good quality, that is, when the reed is of the right age, the fibers dry out a pale cream color. While the man is occupied at this task the girls make temporary necklaces from the green outer skin and the boys use the thin central stems as arrows for their small bows. These dried-out bunches are [30] a favorite decoration of the Nambicuara when painted with horizontal bands of urucú. They can then be suspended from the neck and allowed to hang down the back, or pieces are attached to the arm bands, leg bands, and in front to the belt.

Cotton twine is used for making arrows, stringing beads, weaving arm bands and the narrow shoulder straps which women use for carrying young children. From the cotton bunch (*kóndee*) the woman picks the bolls (*kóndéiee*) to make cotton twine (*kóndéiee*). As the making of burití twine is a man's task, so the making of cotton twine is purely a woman's task. After picking the seeds from the bolls she spreads the cotton into flat disks and then into circles. Next she breaks the circles and joins them to form a long rope about an inch in diameter. This rope she winds around her arm, twists the end of it with her fingers, and fastens it to the top of a spindle (*wenkéiee*). With a twirl of her fingers she sets it spinning and lets it drop, plucking out the cotton as it is spun. Later she unties the string and fastens it near the wheel and then by spinning the spindle on the ground the twine is wrapped around it. This process is repeated until the cotton rope is used up.

286 The men do the weaving on a true but very makeshift loom. Two forked sticks, roughly a yard long, are thrust into the ground about 2 feet apart and at an angle. One cross bar rests in the forks while another is fastened on near the ground. The warp is wound around these cross bars. The heddle, shuttle, and sword are used in [77] weaving the narrow material. It seems very likely that this type of loom was taken over from the Arawakan Paressí.

The bast strap or band (*se'en*) is made from embira and is used for pressing manioc pulp, for carrying children or baskets, and, when cut into strips, is used for tying up bundles.

THE SOCIAL USE OF KINSHIP TERMS AMONG BRAZILIAN INDIANS

By CLAUDE LEVI STRAUSS

121 607 THE kinship system of the Nambikuara Indians of the Western Matto Grosso is one of the most simple in Brazil. At the same time it is typical of a sociological pattern, cross cousin marriage, which according to our present information seems to have been very common throughout South America. The object of this article is to compare the familial organization of the Nambikuara with that of other tribes described in the older literature and to show that a certain kinship tie, the brother-in-law relationship, once possessed a meaning among many South American tribes far transcending a simple expression of relationship. This significance, still observable in Nambikuara culture, is both sexual and politico-social; and, owing to its complexity, the brother-in-law relationship may perhaps be regarded as an actual institution. Since the sixteenth century travellers and sociologists have failed to devote sufficient attention to the phenomenon, probably because it could readily be interpreted as a development of the imported Iberian *compadre* relationship. In our opinion, on the contrary, the brother-in-law relationship, together with its remarkable implications, constitutes an indigenous aboriginal institution based on the pattern of native culture. Nevertheless, it presents a striking example of convergence in which the native and Latin-Mediterranean institutions show numerous apparent similarities overlying important structural differences.

131 133 The Nambikuara Indians are settled on the upper courses of the feeders of the Tapajoz River, between the eleventh and the fifteenth parallels. Their territory consists of a semi-desert savanna, which contrasts with the narrow gallery forests along the main waterways. The fertile soil of these forests allows [511] the natives to cultivate a few gardens in the rainy season, but during most of the year the Nambikuara subsist mainly by hunting and gathering wild food. 177 Compared to the majority of Brazilian tribes, their cultural level is low. As they were discovered only in 1907 and as they had practically no contact with white civilisation between the year of the Rondon-Roosevelt Expedition in 1914 and the time of our own field work in 1938–39, their familial and social organization may be considered still intact.

601 The Nambikuara kinship system may be summarized as follows: All the father's brothers are classified together with the father and are called "father," and all the mother's sisters are classified with the mother and are called "mother." The father's sisters and the mother's brothers are classified together with the spouse's parents and the parents' parents in a single category which denotes simultaneously the cross aunts and cross uncles, the mother-in-law and father-in-law, and the grandparents. Passing to Ego's generation, the parallel cousins, both the children of the father's brothers and of the mother's sisters, are merged with siblings and are called "brother" and "sister," Turn-

261 which they covered themselves, squatting in a circle beneath the leaves and singing all the while. After a long time they rose, and with the branches still tied to their backs they started dancing around their catch, which was later carved.

115 Unhappily, Gouveia was of an amazing inadequacy. He had lived among them, a captive, for six months; he had actually married an Indian woman, who had tried her best to teach him the language of her forefathers. Yet in the end he fled, bringing back only the vaguest sort of information such as the above, which nevertheless I have deemed proper to record here.

276 Of the stimulants customarily used by primitive peoples, tobacco is the most important [among the Nambicuara] aside from those alcoholic beverages which have already been mentioned.

I have stated earlier that they dry the leaves between two pieces of wood which they stick into the house thatch; when they wish to smoke, they take a leaf and crumble it between their fingers, rolling up the dust in another leaf plucked from a tree which the Cocozu call enandzũ.

[238] They also keep tobacco by reducing the leaves to dust which they store in special gourds.

[Fig. 28]

[177] Prior to the arrival of the Rondon Commission, the pipe was unknown among the people of the Serra do Norte. Even today they do not like it and prefer their cigarettes, which are small and quite unlike the huge rolls of some Amazon tribes. [Fig. 30]

Their tobacco (Nicotiana tabacum) is mild and pleasantly scented. On journeys they always carry gourds filled with tobacco dust, or sticks with tobacco leaves; if they feel like smoking somewhere along the way, they stop and form a circle. They proceed as if they were about to have a meal and kindle a small fire. When the cigarettes are finished they continue on their way.

They are extremely fond of our roll tobacco, especially when made into cigarettes with pieces of newspaper...

291 The Indians of the Serra do Norte go naked. Both men and
184 women wear a straw cord around the hips. The Cocozu wear bands of embira around the wrists and upper arms, below the knees and

301 [280] [One necklace not mentioned earlier] is made with the [824] seeds of a Cyperacea (tanieikerê) which the Suya of the Xingu River also use. . . . .

[825 237] Oradaikruzê is a beautiful bracelet made with the tail rings of the giant armadillo (Dasypus gigas). It looks like ivory. Other bracelets are made from the nuts of the babassu and pindova (Orbignya speciosa) [824] palms.

[Fig. 65]

Bands for the upper arm are made of cotton and fastened similarly to those of the Paressi.

291 The jalaçu is a simple fiber cape, widely used, which fastens to the neck and hangs down the back. There is also a black feather cape in the collection.

301 [281] The stem of the unetizú (nose plume) is made of thin bamboo or the stalk of a tough grass (Andropogon).

. . . . The helmets of puma or jaguar hide are used in that region only by the Nambicuara and by the Cayabi of the Paratininga.

[Fig. 66]

285 Max Schmidt broadly classified Brazilian Indian plaiting into Palmblattflechterei (palm-leaf plaiting) and Doppelfadengeflechte (double-strand plaiting). But he also admitted the existence of a third type, where two elements running in different directions are crossed by a third. This type occurs frequently on the Xingu River . . . and is found in Nambicuara baskets (atiçú).

[282: page of figures]

[283] As plaiting material the Nambicuara use titara lianas and sometimes bamboo.

[293] . . . . Nambicuara fans, made with bacaba leaves, . . . are of pentagonal shape . . . .

534 A kind of nose flute made of gourd discs (hait-teataçú) seems ● [177] to have been borrowed from the Paressi.

[Fig. 67]

The double flutes were borrowed from the Tapajoz tribes (Mundurucu, Maue, etc.). [See fig. . . .(70, p.]

177 [Fig., p. 60A]

[284] Some items in the collection are of special inerest because they document the process of material acculturation. They consist on the one hand of objects that incorporate iron found by accident in the tracks of [Fig. 20] hunters and rubber gatherers; and on the other hand of imitative artifacts, made with the unskilled hand of a primitive people desirous of copying the products of a more advanced industry and the forms of a superior art.

[285: full page of figures.]

[286][Fig. 21] An instance of such imitation is provided by several diadems which crudely attempt to copy similar ornaments found among the Nambicuara; the latter are obviously alien objecs plundered from northern tribes, where featherwork has reached a higher development.

[Fig. 68]

They have learned to appreciate the advantages of our hats [287] and prize them highly. An unhappy Indian who had not received one as a gift attempted to make one for his own pleasure, plaiting and adjusting bacaba leaflets...

Chapter XI

Conclusions

174 [307] It is not possible at this time to attempt a definitive synthesis of Nambicuara ethnography in relation to other tribes.

If we could distinguish in Brazil the two classical periods (Paleolithic and Neolithic), the Serra do Norte Indians would be included in the former; their axes are crudely chipped and their culture resembles the characteristic Paleolithic pattern. (1)

1. Diagramatically and in relation to their neighbors, the Nambicuara recall the Paleolithic peoples; but their culture, with its rudiments of agriculture and weaving and its crude

Fig. 68. Imitation of a straw hat made by a Juruena River Indian.

174

but smooth-edged axes, is more akin to the proto-Neolithic or transitional period. The present trend is to recognize in the New World Paleolithic industries . . . but no formal overlapping periods as in Europe. (R. L.)

A later footnote by Heloisa Alberto-Torres which is not reproduced here contains the following statement: ". . . an interesting ethnographic relationship is [established by] the absolute identity of Australian and Nambicuara axes . . ." (Ed.)

At first observation, the Nambicuara might seem to be an old and backward branch of the Paressi tribe.

[308] What we know of the physical anthropology, ethnography and linguistics of both groups, however, invalidates this supposition.

177 Yet their culture bears unmistakable signs of Paressi influence.
[302] The first is the beehive-shaped house, formerly built by the Paressi. This is an import among the Nambicuara; the original house of the Serra do Norte Indians is the screen of leaves and branches, similar to the kijême of the Botocudo (Windschirm of the German ethnologists) and reminiscent of the North American wigwam.

[Fig., p. 61A]

[309] And if they did not borrow the large "round house" from the Paressi, they adopted it from Bolivian Indians.

[303] Another instance of alien influence is the nose plume, which the Paressi do not wear now but which formerly, according to Antonio
177 Pires, they could not do without; and also the nose flute, which
534 [the Nambicuara] play unskilfully, as though it were a little-known instrument of yet unfathomed secrets.

The double flute seems to have been brought from the north. It must be an import from the Maue and Munducuru, with whom the Serra do Norte Indians have had serious clashes as already mentioned above.

[Fig. 70]

177 Their plaiting follows patterns clearly characteristic of the [285] Xingu (Trumai and Nahuqua) and gives proof of contact with those backward tribes which the rudimentary culture of the Nambicuara had already implied.

[53] The quadrangular barbecue, which differs from the usual pattern, is used only by the more advanced groups (Tagnani, etc.); it recalls the barbecue of the Javahe as depicted by Fritz Krause. (1)

1. F. Krause, In Den Wildnissen Brasiliens [In the Brazilian Wilderness] (Leipzig, 1911).

[301] The straw ornaments of the Nambicuara are quite similar to 197 those of the Suya. But linguistic affinities are even more indicative of contact between the two groups. No other people speaks a dialect [310] so similar to that of the Nambicuara in terms of word morphology, although the two languages are otherwise quite different.

171 It is interesting that a spontaneous affinity should arise be- 177 tween two remote and equally primitive tribes, the Guayaki of Paraguay and the Nambicuara of the Serra do Norte, from their common use of the jaguar hide helmet.

However, I am inclined to believe that the latter copied it from their neighbors, the Cayabi of the Parataninga River, who use helmets of the same material.

174 Unfamiliarity with the banana tree and with the pipe (an ob- 171 ject frequently encountered in North American mounds and Brazilian sambaquis) indicates how long the Nambicuara have been established in their mountain range.

Recognition of the Ge-Botocudo group as one of the oldest representatives of aboriginal South American populations is no longer a matter of dispute. . . . .

171 [311] There is no doubt, in my opinion, that the [Brazilian] linguistic groupings correspond to ascending stages of civilication [312]. . . . . The Serra do Norte is inhabited by a people of Ge culture evolving toward the Nu-Arawakan culture, of which they have barely reached the initial stages.

/215 cont./

278 threatens to overflow it is removed from the fire for a second and then put back to boil. A thick, reddish scum forms which [413] holds the largest impurities; it is removed as it appears with a straw from a palm tree (Pl. V, A). After five to ten minutes on an average the boiling diminishes; the liquid turns brown and begins to thicken. It is then taken from the fire and [415] poured with the aid of a funnel (kǫ̃li) made from a rolled leaf into a new receptacle to be concentrated (Pl. IV, C).

[415] [177] Concentration. The concentration is done in a receptacle (here, a tin can from the mission) suspended 40 or 50 centimeters above a small fire, into which successive portions of liquid are added as they are prepared. The concentration takes two to three hours. According to its degree /of concentration/ they obtain a thick blackish-brown liquid, reddish when looked through, ready to be applied to the arrows with a straw, or a black paste which becomes very hard on cooling and can be kept for a long time. Before being used this paste must be softened at low heat.

The Çabanè recommend that one not touch the curare with the fingers nor even breathe the steam from it during the boiling. This hypothetical toxicity of the steam had already been noted by former travelers; it was even asserted that these emanations were so dangerous that the Indians had the curare prepared by old women who almost always succumbed to it. One can see (Pl. V, A) that the Çabanè sorcerer is not afraid of it.

Curare does not enter healthy skin, and the Ñambikwara of the Juruena press the water-soaked bark between their hands, taking the sole precaution of washing immediately afterward. The steam that I voluntarily inhaled never caused me the least sickness.

[192] The Çabanè call curare and the plant which produces it irĩwa, and the still unconcentrated liquid from soaking iriwiya. The Tagnani name the plant and the curare naĩdę̃.

/220 cont./

278 171 [177] The Tamandé Ñambikwara, of the upper course of the Roosevelt River, assured me that curare had come to them from other Indians living farther to the north, in the region of the Gy Paraná /Gi-Paraná River/; it was not possible to make them specify what kind of Indians these were.

The Cabixiano /Cabishi?/ of the Rio Mequem, to the northeast of Ñambikwara territory, also use curare. According to a civilized Indian of this group encountered at the post of Baron de Melgaço, their product with a complex vegetable base is prepared secretly and only by a few old men; it is a hard curare in a jar. It is used for hunting, even of tapirs, and for war.

The Pareci, along with the Ñambikwara, represent the extreme southern point of the spread of curare, the use of which as one goes toward the Amazon becomes more and more frequent and its preparation surrounded with more mystery.

278 137 All the curares are not as simple as the Ñambikwara curare, but all appear to have as their principal base a species of Strychnos which varies according to the region. Certain Strychnos such as St. toxifera Benth., Str. lethalis Barb. Rod., and especially St. crevauxhiana Baill, are particularly toxic; others like St. pseudo-quina are very low in poisonous elements.

278 Besides the Strychnos, active elements of curare, of numerous other plants generally poisonous but with very diverse properties, and of animal substances such as venoms, often enter into the composition of this poison. Their addition answers different ends.

Sometimes these are resins or gums whose sole utility is to harden the product and to assure its preservation.

Sometimes they are toxic substances destined to reinforce or to complete the action of the Strychnos.

/221/ In other cases other substances without any actual effect but with magical properties are added to curare. Their nature is infinitely variable.

121 In other publications (2) we have brought up the question of
181

knowing if the type of life of the Nambikwara, apparently very primitive, does or does not constitute the authentic vestige of ancient conditions. Considered in the present, their level of culture is certainly very low. They live naked, especially the women, who only wear a thin string of buriti beads around the waist, some earrings, necklaces worn around the neck or looped over the shoulder, [14] bracelets made from the tail of the large armadillo, and, sometimes, some narrow bands of cotton woven by their husbands, or some buriti straw, tightly bound around the biceps, and wooden pins. Besides the same ornaments, the men sometimes put on a sort of straw pompom, fastened to the waist above the sex organs, and smaller ones, attached to cotton bracelets; on the other hand, they do not wear shell bracelets. The complete ignorance of the hammock and the Nambikwara
[513] custom of sleeping on the ground (or, more rarely, on long strips of the bark of the palm tree paxiuba) has intrigued ethnologists for a long time. This sentiment is shared by neighboring tribes, and the
[101] Paressi, mentioning this peculiarity, call the Nambikwara Uaikoakoré, "those who sleep on the ground."

221 The Nambikwara year must be divided into two distinct periods. During the rainy season (from October to March), each group settles on some small elevation rising above the course of some stream. The Indians then construct crude huts with curious variations in form and materials. They burn clearings in the approaches to the forests which
221 occupy the humid valley floor, and there they plant and cultivate
241 gardens principally with the starch-yielding plants of the manihot genus (sweet and bitter) and tobacco, sometimes some peas, cotton, peanuts, and calabash (Lagenaria sp.). They grate the yucca (manioc) on planks covered with the sharp bark of the palm tree, they press it with the aid of a piece of twisted bark. The garden produce furnishes food resources sufficient for part of the sedentary period, and even of use later: the Nambikwara preserve the yucca by burying the residue of the "grated" pulp in the ground.

221 At the arrival of the dry season, they abandon the village, or rather the site of temporary residence, and each group "breaks up," if one can say that, into several nomadic bands. For about seven

115 a7. --A pretty woman of some twenty years, perhaps less; young
157 wife of A6. Her parents are living and reside, she says, in the village. She is asintu of A1 and a2, arindesu of a3 and a4, aseetasu of a5. She is stupid, egotistical, interested only in herself. She considers herself very seductive, which appears to be (from the Indian point of view, of course) very exaggerated. She systematically refuses to show the slightest interest in the two daughters of her husband, conducts herself very amorously as concerns him.

115 a8 and a9--About six and two years, daughters of the first mar-
855 riage of A6 and daughters of the deceased daughter of a14. The two
157 children are practically left to themselves. Their stepmother does not bother with them; their father takes care of them when his manly tasks and his wife permit him the time. Their grandmother is their
[603] chief aid and it is to her that they run when they hurt themselves, are hungry, thirsty or afraid. But she herself is absorbed by the cares of her sons, of her stepson (A15) and of her husband. And very often the baby is neglected for entire days, covered with ashes and filth, unless some woman of the group, seized by pity or simply [43] disgusted, takes her and gives her a bath. Most often it is her big sister, precociously mature, who takes care of her, carries her, even though she is scarcely any bigger, feeds her and cleans her up. Both are charming children, gay and hungry for caresses like those who are habitually deprived of them. Their lot is a great worry for the
● [181] community. Under this regime of a hard life constantly absorbed by the small tasks, each one of which is hard work, one can with difficulty accept other cares than one's own. And these neglected children are a perpetual source of irritation, of which they are often the victims, even when taken care of. Many times we wondered if we should not take charge of the youngest of the children. They would have given her to us gladly. uThe baby was so cute that we would have been tempted if the perspective of seeing ourselves having a quarrel on the return trip with the Service for the Protection of the Indians had not, very reasonably, dissuaded us.

115 A10. --About 40 years. He is alonsu of A1, ajunkedisu of a2,
157 ahuinosu of a5, married to a11. His parents are dead. He is amiable and grinning, he suffers from a hernia which he hides under a piece of cloth hanging from his waist. His activity is considerably decreased. He is little interested in our work and not very eager to understand our questions and give us information.

a11. --About 40 years. Wife of A10. She is a "sister" of a2, a "wife" of A1, a "mother" of a5. She is dark, eager and industrious,

591 A27 with his son A28. All this offers a very confusing spectacle,
621 and it is not the only case among the Nambikwara where the sociologist feels discouraged from deducing fixed rules. In a case such as that of the rules of residence, the answers of the Indians and the study of the facts might lead one to conclude that these rules do not exist, but such a conclusion should not be accepted except with the most extreme reservations. We shall be forced from time to time to insist on the fact that, in a society whose demographic base is broken up in a very short space of time, the traditional rules might be clouded by the necessity of solving cases which have become individual and concrete by force of things. Among peoples who live under such strenuous conditions, a certain distribution in elementary associations of individuals of different sex and age might be decisive to assure the means of existence for each of them. Many family combinations seem thus to result from immediate necessities. It could also be that the rules exist, and are based on sociological
● 181 reasons which escape us. A society made up of wandering bands which one never finds again with the same composition after a few weeks interval because certain members or families have left it, while others have come to join up; whose camps never offer the same exact distribution from day to day; whose winter huts are most
[609] often destroyed during the dry season; who flee one another, chase one another off, attack each other in frequent conflicts, and about which the least one can say is that in periods of peace, they avoid one another; whose [50] material culture, reduced to the strict minimum, puts into use only rudimentary techniques where social differentiations cannot be expressed; such a society offers to the sociologist ever-changing material, that is fleeting and often cannot be grasped. In very numerous cases, its laws of organization escape analysis and, supposing that they exist, could not be discovered except on the occasion of an extended visit, not only during the period of the nomadic life, but also of the sedentary life.

621 Central and southern group, dialect b1: tarũnde, maimãde (b1); mamaĩndeti (c) oaĩndesu, nikoêdetosu (a1).

We have divided the encampment of the two groups b1 and c. The latter is composed of 17 persons divided into five fires. Both
[101 were wandering in the zone of the line of the separation of waters
131] between the Tapajoz and the Madeira (Vilhena Rivers). We shall

3: Lévi-Strauss E-5 (1938-1939) 1944

Gardening exists only during the rainy season and does not free the Nambikuara from wandering during the seven months of the dry season, looking for wild roots, fruits and seeds, small animals such as lizards, snakes, bats, spiders and grasshoppers and, generally speaking, anything which may prevent them from starving. As a matter of fact, their geographical surroundings, which are located in the northwestern part of the state of Mato Grosso and include the headwaters of the Tapajos, Rio Roosevelt and Rio Gi-Parana, consist of a desolated savanna with few vegetal resources and still less game.

Had I approached my subject from a point of view other than the one outlined above, I could not have avoided a long discussion in South American cultural history, aimed at clearing up this apparent primitiveness, on the question as to whether the survival of early conditions of life in South America is genuine or whether we should consider it as a more recent—although undoubtedly pre-columbian—result of culture clashes and processes of acculturation. Whatever the answer may be, it cannot substantially change our problem: whether tarriant or recessive, the Nambikuara society functions, in the present, as one of the simplest forms of human society to be conceived. We shall not seek information from the particular history which kept them in their exceptionally crude organization or brought them back to it. We shall only look at the experiment in social anthropology which they now enact under our very eyes.

This holds especially true in respect to their social and political life. For if we do not know what was the material culture of the Nambikuara forty years ago (they were discovered only in 1907), we do know that their numbers became tremendously reduced after their contact with white civilization. General (then Colonel) Candido Mariano da Silva Rondon, who discovered and studied them, first stated that their number was about 20,000. This was around 1915. I take this figure as greatly exaggerated, but even if reduced by one half, it considerably exceeds the present number which is hardly more than 2,000. Epidemics have taken care of the difference. What does this mean, from the point of view of our study? During the dry season, the Nambikuara live in nomadic bands, each one under the leadership of a chief, who, during the sedentary life of the rainy months, may be either a village chief or a person of position. General Rondon wrote that, at the time he was exploring the country, it was not rare to see bands averaging two or three hundred individuals. Now, sixty or seventy

4: Obrg E-5 (1949)1953
SP17 Nambicuara SP17

ooo sionaris had not yet learned enough Iraíra to make working with informants possible.

621 As alof the following information, unless other-
622 wise spetified, relates to the Wakítisu band, a short decription of this band is in order. Today the band consists of 18 individuals, of which Julio
[731] is the *cief*. About 5 years ago, before a measles epidemi decimated it, the band was roughly twice the sizit is today. Julio is a man of middle age, has thre wives and two children, and probably holds is leadership by being the strongest and ablest man in the band. Exrept for one of Julio's wives and her daughter who are Elótasu, the members of the band are Wakítisu and
[595 related to one another. Julio took the Elótasu
583] woman from the Elótasu band by killing her husbani. He claims he did this because the Elótasu chief stole one of his wives some years ago. He claims he is going to steal another wife, for every *cief* is supposed to have four. Only three other men, Martin, Marciano, and Joaquin, are marrie, each having one wife. The remaining four ar either widowers or as yet unmarried.

164 Of a the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were th most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covred with some kind of scaly skin disease from head to foot, and another was deaf and dumb. The women and children, however, appeared to be
515 healthy. Owing to the fact that they use no
[513] hammocks but sleep on the ground, they are alwayscovered with dirt. On cold nights they remove the fires and sleep in the warm ashes.
[291] The Wakítisu wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat, makes proximity to them rather distasteful. They
[164] also appear to be heavily infected with internal parasite, for their stomaches are distended and they re continually passing wind. On several occasions when a number of them had crowded into he small room we used for working we had to cease work in order to air the room.

● 181 In their manners the Nambicuara also contrast
171 sharply with the other tribes I visited. The

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

181 Caduveo, perhaps remindful of their slave-owning
171 past, are proud, conceited, and boastful. The Arawak-speaking Terena and Paresi, like the Arawak-speaking Waurá, are quiet, unassuming, friendly, and ready to help yet take no liberties. The Umotina speak only when spoken to and appear to wish to be by themselves. They provide information if they think the gifts are sufficient and to their taste; otherwise, they saunter off and are never available when required. An Umotina does just what he wishes to do and hates any kind of dictation. The Bacairí and Camayurá are intimately friendly, talkative, and ingratiating, expect gifts and bestow gifts in return, volunteer information, are full of humor and curiosity, and are clean and polite.

181 The Nambicuara, on the other hand, are surly,
576 and impolite even to rudeness. On many occa-
609 sions when I went to visit Julio at his camp he was lying down near a fire and as he saw me approach he turned his back to me saying that he did not wish to talk. The missionaries informed me that a Nambicuara will ask for some object several times and if it is not given to him he will try to take it. In order to keep the Indians out they would sometimes close the screen door, but if a Nambicuara really wanted to enter he would tear a hole in the screen and walk in. The Nambicuara have two well-recognized ways of showing disgust or disdain. One day I stopped a woman carrying a burden basket to take her photograph. She evidently did not like being stopped, for as she passed me a moment later she turned her back to me and passed wind. This the missionaries claimed is a very common custom of the Nambicuara. The men have an even stronger way of showing disbelief and disgust. After listening to something with which he does not agree a Nambicuara will get up, grasp his penis, and slap it sharply against his groin and walk off with a "that for you" look. One might call it a Nambicuara "raspberry." Although some of these personality
181 traits are old and culturally defined, there appears
648 to be little doubt that the Nambicuara have a deep hatred of the white man. They realize that the white men are rich compared with themselves and that contact with the whites has brought diseases which are killing them off rapidly. They realize, too, that both the whites and the Paresi consider them in the lowest category of human beings.

[p.650]

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

[101]
[18]
648

The Parecí call the Nambicuara "those who sleep on the ground" and ridicule them in other ways. One does not have to remain long among the Nambicuara in order to feel this underlying hatred, mistrust, and despair, which create in the observer a feeling of depression not unmixed with sympathy.

198

The Nambicuara is the only tribe I have met who speak pidgin Portuguese, which without some training is almost unintelligible. For instance, "bastante" becomes *marunde*, "pequeno" becomes *shibi*, "grande" becomes *papai*, and "criança" becomes *pinto*. If they wish to compare two things to bring out a likeness they say this thing is the brother of something else.

142
171

Compared with their neighbors, the Parecí and Iranxe, the Nambicuara are taller, darker, and longer-headed. It is very easy, for instance, even at a distance, to distinguish Nambicuara children from Parecí children when they are bathing in the river. In contrast to the light brown of the Parecí skin the Nambicuara skin appears to have an element of black that gives it a dark-gray undertone. Many individuals have a certain amount of wave in their hair, although the waviness may be accentuated by the unkempt matted condition of the hair. Detailed measurements and indexes are given in Appendix 3.[1] The eyes of the Nambicuara are very dark brown, almost black in some individuals, and have a brightness which contrasts sharply with the rather dull eye of the Parecí. The only other Indians that I have met with this brightness of the eye are the Caduveo. This brilliance of the eyes does not appear to be correlated with health, for even the sick have it among both peoples.

131

The Nambicuara, as a whole, occupy a territory bounded on the east by the Papagaio River and on the west by the headwaters of the Rio Roosevelt and the Pimenta Bueno River. To the south they extend as far as the headwaters of the Rio Juruena and the Rio Kabishí. To the north they are bounded by a line running roughly from latitude 12°20′ on the Papagaio River to latitude 11° on the Rio Roosevelt. Formerly, it is believed, they extended farther northward. The telegraph line runs through Nambicuara territory beginning at Utiarity and ending at Barão de Melgaço to the west. The territory to the south and east of the Nambicuara is occupied by the remnants of the Parecí. To the north of the Nambicuara

101

[1] [See cat. #6, pp. 128-135.-A.]

[p. 85(a)]

of the couple among the Nambikwara. It is the economic and psychological unit par excellence. Not only among errant bands which are made and unmade unceasingly does the couple appear as the only stable reality (at least theoretically), but it is the couple alone which assures the subsistence of the members of the group. The Nambikwara live under a double economy: the economy of hunters and gardeners on one hand, the economy of collectors and gatherers on the other. The first is assured by the man, the second by the woman. While the masculine group departs for a whole day to hunt, armed with bows and arrows, or works in the gardens during the rainy season, the women, armed with digging implements, wander with their children across the plain, and gather, pull out, pick, capture, seize [55] everything on their route that is worthy of serving as food: grain, fruits, berries, roots, tubers, eggs, small animals of all sorts. At the end of the day, the couple meets around the fire. When the manioc is ripe, and as long as it remains so, the man brings a bundle of roots which the women pound and press to make a kind of pancake (uridnonu, al), and when the hunt has been fruitful, they rapidly cook pieces of small animals by burying them under the burning cinders of the family fire. But for seven months of the year, manioc is rare. As for the hunt, it is most often a matter of chance in these sterile sands where a skinny small animal hardly ever leaves the shade, and the pasture lands at the heads of rivers are separated from one another by considerable stretches of semi-desert brush. Thus, the family must most often subsist on the collection of the women. Very often we have attended (and sometimes shared) these diabolical doll-size snacks which, for the Nambikwara, for half the year, are the only hope of not dying of hunger. When the man, silent and fatigued, returns to camp and throws his bow and arrows which he could not use to one side, from the basket of the woman is extracted an extraordinary and moving collection: some orange fruit from the buriti palm (e[illegible]ru, al, e[illegible]nde, bl, [illegible]ola, c), two fat poisonous spiders (horaitu, al, kotende, bl), some tiny lizards' eggs and some of these animals (kattaterisu, al, nagade, bl, talitne, c), a bat, some small nuts from the bacaiuva palm (arookesu, al, kokoninde, bl), or nagnassu (aradikisu, al), a handful of grasshoppers (takedasu, al, tagare, bl, tasti, c). The pulpy fruits are crushed with the hands in a calabash filled with water, the nuts cracked with the blows of a stone, the animals and larvae buried pell-mell in the coals; and this repast is gaily devoured, a meal which would not be sufficient to satisfy the hunger of a white person, but which feeds a family here.

593
182
462
The conversation becomes animated and laughter spreads. In the dark prairie the camp fires burn. Around the fire, the only protection against the cold which descends, behind the frail windbreak of palms [342] and branches hastily planted in the ground on the side where wind or [415] rain is expected; near the baskets filled with poor objects which constitute their whole earthly treasure; lying on the ground which extends around, haunted only by other bands equally hostile and fearful, the couples, embracing tightly, are truly seen as the support of one another, the comfort, the only help against the daily difficulties and the dreamy melancholy invades the Nambikwara soul from time to time. The visitor who camps in the brush with the Indians for the first time feels tenderness as well as anguish and pity before the spectacle of this humanity so completely unprotected; crushed, apparently against the soil of a hostile land by some implacable cataclysm; naked, shivering around the hesitant fires. He circulates tip-toe among the underbrush, in the dark, avoiding crushing in his walk a hand, an arm, a trunk, whose warm reflections are seen by the light of the fires. But this misery is animated by whispering and laughter. [56] The couples clasp one another as in the nostalgia of a lost union. Their caresses, at the same time tender and candid, are not interrupted by the passage of the stranger. One senses in all [157] of them an immense gentleness, a profound carelessness, a naive and charming animal satisfaction, and, emanating from all that, something like the most moving and credible expression of human tenderness.

593
831
462
562
[517]
Thus it is not surprising that the attitude of the two sexes as concerns one another is characterized by intense interest. This interest is translated in certain cases by the vocabulary. In fact the Nambikwara have only one word to express "pretty" and "young," and a single word to signify "ugly" and "old" (munjene, jeʒene, bl). Their esthetic judgments are thus based essentially on human considerations, and above all, sexual ones. But the interest which is manifested between the sexes is of a complex nature. Men judge women in a mass, as being a little different from themselves. Depending on the situation, they consider them with desire, admiration, or tenderness. In itself the confusion of terms pointed out above constitutes permanent homage. But it must not be forgotten that the form of economic adaptation realized by sexual division of labor a capital role attributes to the women, since family life rests to a very large degree (probably the greatest) on the collecting of the women, but it represents an [83] inferior type of activity. The ideal life is conceived on the model of agricultural production or hunting. To have plenty of manioc, and

595
601

sense of this term remains doubtful. And it has never been possible, in the course of the questions on kinship, to obtain from polygamous husbands discriminating terms for each of their wives.

595 established between the first wife and the new arrivals. The first
462 wife takes care of her children and devotes herself to the cares of
[252 the household, shredding the manioc and cooking the cumaru nuts.
263] She is occupied with feminine craft tasks. In short, she carries on her activities within the [61] limits of the sexual division of labor. The other wives aid her occasionally, but their main duty seems to be to assist their husband in his masculine tasks. They are comrades and collaborators who, in the general plan of the division of labor, could be more justifiably classed with the men. Their aid seems like a method on the part of the chief of the group to fulfill his heavy duties more easily, and like a psychological compensation for his responsibilities. When he leaves on a hunting or reconnoitering expedition, one of his polygamous wives accompanies him to hold his arrows and to carry in her basket the eventual prize. When he works around the camp or in the village, it is with their aid and com-
[515] pany. Although men and women do not bathe at the same time, one sometimes sees the husband and his polygamous wives take a bath together, the pretext for great struggles in the water, and innumerable
[832 jokes. In the evening he plays with them, either amorously, rolling
524] in the sand embracing two, three or four, or in a childlike way. For example A1, a3 and a4, stretched out on their backs, by way of making a star with three points on the ground, raise their feet in the air and knock them against one another, bottom of foot against bottom of foot, in a regular rythm (this game is described by the term eridaŋkitiu, al).

595 The polygamous union is thus presented as a super-imposition
● 182 of a plural form of amorous companionship on the monogamous marriage, and at the same time, we insist, as an attribute of command with a functional value from the psychological point of view as well as from the economic. The women usually live on very good terms, and although the first wife has a role that might seem a little unappreciated, working while she hears at her side the bursts of laughter of her husband and of his little mistresses, and sometimes even witnesses more tender frolicking, she does not show either bitterness or jealousy. In fact, this distribution of roles is not either unchangeable or rigorous, and, upon occasion, although rarely, the

595 husband and his first wife will also play, while bathing or near the
182 camp fire. She is in no way excluded from the gay life. Moreover, her slighter participation in relationships of amorous comradeship is compensated by a greater respectability and a certain authority over her young companions. It must not be forgotten (and we have
595 pointed it out in the study of the kinship system) that the polygamous
582 marriage presents a double aspect--the marriage of a man with a woman and with some "daughters" of the latter, or with a woman and the "sisters" of the latter. The respective situations of A1, a2 and a3 and a4 realize the two situations at the same time since, at least in one of the cases (with a4), it is the second oblique marriage within the same line. As example of the first type, we have the marriages of A32 and of A56; for the second type, one can also refer to the marriage of C20 (1).

1. Cf. above, p. 53.

595 The polygamous wives then, as a general rule, belong to a
571 younger generation. The first wife calls them "daughters" or of "little sisters," and they behave as such. A form of spontaneous grouping which one finds realized frequently is the union of the husband's daughters (by his first wife) and his young wives (polygamous). They form a sort of gay and carefree childlike society, but also a more or less subordinate society. We have found households comprised of two (A42, A57, A73, B1, B32, C20), three (A1,) and five (A32) wives. It does not seem that the number of wives is proportional to the social importance of the husband (even though polygamous union itself is conditioned by this), but is rather haphazard.

SEX LIFE

000 We shall begin by giving some information concerning organic activities.

514 Coughing, sneezing, spitting, blowing the nose, belching, ex-
515 pelling flatus, constitute operations which are not subject to any
576 etiquette, and which the vocabulary does not always clearly distinguish (thus: tolúrige, b1, to cough, and tolútiore, b2, to sneeze; kaáte, sneeze, and kasípe, c, spit, tarnikititu, a1, to expel flatus or to defecate). All of these needs are satisfied publicly, without precaution, ritual gesture or formula, as much on the part of the executor as on that of the spectators. No attention is paid to them, and everything

857 iõndage ʃutẽnturu kajãno kajãn kajãn hõte kajãnde ʃutẽntere kuajkano (b1).

When I am big, I shall catch the caetetu, caetetu, caetetu, the monkey, the caetetus, I shall kill them when it (the dog) barks.

[368] She makes an error in grammar which the father points out
857 laughingly: she should have said tilõdage, "when I am big,"
154 instead of the masculine form she used. The error is interesting, placed in context, which manifestly shows a feminine desire to raise the economic activities reserved for that sex to the level of those which are the men's privilege. As the exact sense of ʃutẽntere is "to kill by beating with a stick or club" (here, the digging stick), the informant tries unconsciously to identify [71] feminine collecting and gathering (which can only aim at the capture of small animals) with the masculine hunt, armed with bow and arrows.

593 The relationships between brothers and sisters have not given rise to any particular observation. In the central and southern group, one finds a special expression to designate the brother of the same sex, nlaõre, "the other one"; this term is not only applied to kinship relationships, but also designates objects be-
[342] longing to the same type. Thus the five or six poles planted obliquely which fan out from the center, and which hold up the
[534] first skeleton of the hut, are called indelẽaore; likewise, the double (kalõde) or triple (lutəndione) pipes or whistles. Friendly
857 groups are said to be "brothers" (1) also, and in discussions

1. See p. 92.

between adversaries they use the exclamation:

17. kakõtjane tãkənããtjane (b1).

Wicked one! You are no longer my brother!

[92] which indicates that among the Nambikwara the term "brother" has the same wide sense which it possesses in our vocabulary.
857 But in the heart of the infantile society, numerous attitudes take
182 form which prepare or advance later relationships. The orphan baby a9 spends nearly the whole day in the hands of her young sister a8 (one is 2 to 3 years old, the other 6 to 7). Her sister takes care of her, carries her, feeds her. a19 and a20 (who are "mothers") act like elders toward these two children, in a way more marked than the real difference in age calls for. In fact, a8 and a20 are contemporaries. The eldest, a19, cracks bacaiuva

857 nuts for her sister a20 and eats them with her. When they are
182 satisfied, they give the rest to a8, who cracks them, in turn, for her little sister.

857 The relationships between children giving each other the names husband and wife are more obscure, and we have not succeeded in forming a clear concept of them. We have pointed out a slight taboo exists concerning the expression of this kinship relationship. However, generally, the young "husbands" or "wives" do not manifest any special behavior toward one another, either positive or negative. Nevertheless, we have encountered indisputable cases where the young potential spouses conduct themselves as true spouses. In the evening they leave the family fire and carry burning pieces of wood to light their fire in a corner of the camp. The witnesses pay scarcely any attention to this action. For example, someone will make the remark:

18. ɯɾtnaɯri ɯɾraɨre :ɨɡahete ɯɾraɨena noɾẽteɯii etɨɾtere (b1).
The children are taking fire to make a fire, they blow to make flames.

[72] and the young "husband" says to his potential wife:

19. tadoõtakɯi nikɯitũteraɯi eɾʔere aituɾɯɯi ɯatadahaki (b1)
Bend down! Stir the fire, carry! Look (for more). Put it there!

857 After this, they install themselves near their fire and give
864 themselves over, insofar as it is within their means, to all the erotic acts that they have seen their elders practice. The incident is greeted by the adults with indifference, or, at the most, with amused smiles: ɯɨnó taminusere, "there are the children having little sexual relations," they say in passing. We have only verified these practices in a haphazard way among the young children (5 to 7 years). They seem to be absent among those nearer puberty, but, in the latter case, a lacuna appears in our observations, due to the lack of subjects for comparison.

857 As regards strangers, the attitude of children is quite variable.
609 Certain ones manifest fear and hostility for a long time:

20. taɯẽtte ʔiina ɨaʔirina uniena (b1)
My child is frightened, he is ashamed, he doesn't move.

sometimes explained by a surprising external detail:

herakəloɯi ɨɾena (b1)
he is afraid of glasses.

Others (or the same ones after several days or weeks of acclimatization) are curious, friendly, eventually mystifying. Thus,

605 But the relationship of "cross-cousins potentially or effectively allied by the marriage of their sister"—which seems to be the most adequate equivalent of the [77] term tarûte—can be extrapolated largely above and beyond family relationships. In certain cases, it is used to create, among individuals without relations, original ties whose role is to fuse, indirectly, in a same family group, groups formerly heterogenous. It was noted 621 at the beginning of this work (1) that the central and southern ●182 184

1. See p. 6.

groups have decreased quite considerably owing to the epidemics of the last fifteen years. Some of them have seen their power reduced to such a degree that the following of an independent social existence in such conditions might seem an illusory objective. Certain ones then grouped together in the hope of reconstituting a workable unity. Thus it is that when we found them the group designated under the title b1 (restricted), comprising 18 persons, and group c, comprising 34 persons, lived together, under the authority of their respective chiefs, but these working together. It is to be presumed also that the decrease in number was not the only reason for that alliance, and that group c represented a fraction of a more numerous group which it had been forced to flee for an undetermined reason. It probably sought greater security in the nomad's life shared with group b1. Some rather obscure events (2) which occurred

2. See p. 103.

during our stay let us glimpse the political background whose details we do not know. Whatever the case may be, the two groups traveled together, camped at the same times, but without mixing their fires, the constituent families forming two adjacent agglomerations. The most surprising trait of this or- [91] ganization was that the two groups did not speak the same language and could not communicate with one another except through one or two individuals belonging to each group who acted as interpreters. Notably, no direct communication existed between B1, chief of the Tarundé, and his colleague C20, chief and shaman of group Sabané. In fact, if there is

In fact, if there is
621 no doubt concerning the close affinity of dialects a1, a2, b1 and b2,
[197] which do not differ among themselves except as the derivations
182 of a mother language, dialect c offers, as regards the preceding,
184 such profound differences that one does not know if one is in the presence of a language of the same family. In any case, in whatever way linguistic study might resolve this problem, it can be reasonably set forth. We do not hesitate, nevertheless (and in spite of anthropological differences), to place group c in the cultural family of the Nambikwara, because of the identity of material culture and way of life, and especially because of the psychological attitude of groups b1, b2 and c as regards one another, who ostensibly recognize their community.

621 The union of the two groups posed a problem, that of the
605 nature of the relationships which would go on between their respective members. This problem [78] has been resolved by the recognition of all male members of group c as being "cross-cousins"—tarũte, of all the adult males of group b1, and of all the adult males of group b1 as being the jõpa (corresponding to "cross-cousin" in the vocabulary of parentage of group c) of all the adult males of group c. The result, consequently, is that if all the husbands of the two groups are "brothers-in-law among themselves," all the "wives" of a group are "sisters" of the husbands of the other, and all the children of both sexes, in a group, potential husbands or wives of the infants of the other group belonging to the opposite sex. The blood fusion of the two groups is thus definitely assured for the following generation. Here is a type situation which one finds thus realized:

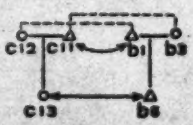

Fig. 18.

The systematic character of this solution is not doubtful. The informants belonging to group b or to group c, when we interrogated them concerning their kinship relationship regarding a male adult of the allied group, never furnished us with a special answer concerning the considered case, but remarked

836 who seem to be susceptible to violent passions. We knew an Indian who fled with a Paressi Indian girl during our stay, and lived with her for several months hidden in the bush and fleeing the husband who was in hot pursuit after them. Here is the way an informant (B15) tells of a former adventure. He reconstructs a dialogue with the beloved woman:

51. ajndarinjẽ — otendnjẽ — ajdoteha ajdakanjajni sutnadajẽ ajrhajtasjindige tamintednjẽ (b1)
Do you want to make love?--I do not wish to.--You are worth nothing! I want to make love or I will kill you! Let us go make love.

Very anxiously the woman responds:

higekanhjẽ uairirẽ uairidednjẽ etjẽdahẽ dungrajeni (b1)
Do it quickly, my husband will be angry, he will beat me.

684 626 There is no social sanction against adultery; but the wronged husband can avenge himself in a fearful manner and in circumstances of this type poison, used either against the wife or against the lover, plays its role. In order to avoid such incidents, the companions intervene between the adversaries and counsel the seducer to disappear for a while:

52. ijehetnjẽ ajkuakatednjãni ekuude ekuude ekuude ekuude ekuude ekuude ekuude ekuude ekuude kajãdodni uaiknoreniani (b1)
Go away.--I am going far away.--When this moon is ended and that one, and that one, and that one, and that one, and that one, and that one, and that one, then, in that one, you may return.

We knew an Indian (C11) whose wife disappeared one day, having left with a member of his group. He thought first of revenge, but his companions intervened, and it was finally decided that the lover should keep the wife and would give him a dog as compensation. Several months later, the lover died (we were not able to find out whether the death was normal or accidental), and the woman returned to her husband, who said he was very happy to have acquired the dog [562] also. This story should not be interpreted in the sense of an equivalence, conceived by the Indian spirit, between a woman and a dog. We have insisted too much on the fundamental role of the woman in Nambikwara [182] life to have to return to that here. But in groups where trade [112] exists in such a primitive form (1) exchanges of goods have as a

1. Cf. p. 93 f.

684 626 [182] conscious function the bringing of psychological compensations incommensurable among themselves, rather than for establishing equivalences of value.

764 184 The Nambikwara have two types of burial. The eastern groups practice double interment. The bodies are first placed in a crouching position (ãriuaerekititu, a1) in a circular ditch (sinitakurisu, a1) seven feet deep heaped up with earth and branches. For two months, they sing, dance and weep around this provisional tomb, until the body is decomposed. Then the bones are carried to the river where they are carefully washed. Then they are carried in [768] a cloth to be permanently buried in the village. The village is then abandoned, but the site is often visited:

53. auregande aŝunikere kadukərage iaudrige ende ende ende inare inaretaire şinoribate (b1)
to dig the grave, to close it, to wait one moon, one moon, one moon, to take out the bones, to bury them in the village.

In the central groups, on the other hand, the bodies would be buried (aotʔenikere, b1) in a prone position (idtarige, b1).

The funeral rites distinguish between movable goods and immovable goods. The first are carefully destroyed; they break and burn the weapons; they unravel the beads and necklaces.

[768] The garden of the dead man, if he cultivated one, is, however, only abandoned, and can be reclaimed later:

54. doŝore dutige adrede autadatige audotahãmdige audotaãmde odenehe'ire odunhi'nde niaotumnie narainidande naraidutige aireduge'ottige den den den nagiaode aire dugiotige tiatugiotige (b1)
The arrows are broken, everything must be broken the beads are unstrung, the beads of the deceased, the fields of the deceased are abandoned one moon, one moon, one moon, and when all is forgotten, another takes the field.

423 Yet it is necessary to avoid confusion on this point. Strictly speaking, there is no land property among the Nambikwara. The chief invites his men to group together to cultivate the gardens, but sometimes such and such an individual decides to clear a field on his own account. These personal appropriations do not give rise to any incidents since the cultivatable land is usually far larger than the collective needs. However, a garden represents a value, because of the considerable amount of work spent in clearing it, especially for people who have never seen metal tools until 30 years ago. Also the rule of destruction of the goods of the deceased respects the

of the Beyond, and condemned to nothingness after death like non-initiated babies. We have described the tender companionship which presides in the relationships between the sexes, and the general harmony which reigns within the groups. But when these are altered, it is to give way to the most extreme solutions, poisoning and murder. It is quite reasonable for the informants to underline spontaneously the role of forgetfulness in funeral rites. (3)

157 562

3. P. 112.

For there is a striking contrast between the joyous irony with which one answers someone who is ignorant enough to inquire about a relative deceased for quite awhile: "ihitu, ihetu" (a1), "to the sand! in the sand!," and the horrible apparition of the atasu which is evoked with ritual sobbing.

Nambikwara rites do not seem to be symbolic in any way. The skeleton-like state of A21 and a22 at the end of the period of abstinence testifies to that, and although ceremonies are rare, they are carried far. The informants speak of periods of three months for the isolation of the young girl entering puberty, and of a bath in the river lasting a whole night as a preliminary to marriage. However much behavior is supple and without complication in daily life, likewise intrusions of the supernatural (in visions and revelations, the séances of shamanism, war dances, etc.) are manifested by the transition to an atmosphere of tragedy. No South American group, to our knowledge, expresses in such a sincere and spontaneous way (for one never feels the theatrical atmosphere of Tupi or chaqueno shamanism) such violent and opposed sentiments, whose individual expression seems inseparable from a social stylization which never betrays them.

796 157 781

• • • • •

It is far from us to wish to assign an exclusively economic cause to this dualism. Nevertheless, it is astonishing to consider that the psychological dualism goes on an equal footing with the organization of social existence around [127] two opposite poles, on the one hand the sedentary life, agricultural, based on the dual masculine activity of the construction of huts and of gardening; on the other hand, the nomadic period, during which subsistence is principally assured by feminine collecting and gathering, the one representing alimentary security and well-being, the other chance and want. To these two ways of life, one followed in the winter, the other in the summer, the Nambikwara react in very different ways. They speak of the former with the melancholy which is attached to the conscious and resigned acceptance of the human condition, to the dull repetition of identical acts.

157 182

157
182

While they speak of the latter with the excitement, and the almost exalted tone, of discovery. Let us listen to an informant (B1) describe the double cycle of the year:

First the sedentary life:

67. nedəntãtage kanaadau hãindige uedəntãnkero, uatliriʔkero
Tomorrow go hunting come back again
uakuiʔnikero dãnkero undãkero
cook again go to bed again sleep again
naingiʔkero airelõkero aikəŋkero
day again go to the field again cultivate the field again
aingəŋkero ãamkərə nunãkero uininũnkero
cultivate again leave again eat again
nangiʔkero danunkero tacrige tãu tãu tãu
another day cut wood cut cut cut
telunũkero [telõndige] mbãri mbãri mbãri
finish again wait wait wait
sorũmkero ŝutnunãtaue [ŝutnũkero] liʔnutiet
burn again the cold comes [still the cold] plants
demũnkero uaɣaariʔanunkero uaaninũnkero
to go again looking for some return again
iraãkero kakuãidnatue [kaikuãnde] hiʔkərage kũkero
plant much dig again
ikəranukutige liʔnuraʔnkero
in order to plant dig plants cut again
telõndãmkero dẽinterituapũmkero aurhãikero
finish again live a long time again pull up the roots
etuʔiʔ etuiʔ etuʔiʔ hãnkero
grateli grateli grateli finish again
nlakərahinkero nkuãulakərahiʔnkero ãtlakero hĩnkero
guãtau hikəninuni (b1)
a new field again plant again

And now the great adventure of the nomadic period:

68. inkənahaire miʔuere ɾrige
We leave at dawn; [the basket] is made it waits.
[128] ãgərage tuatũrige tua tuikiniʔnkero ɾʔkəro
one packs; one fills the basket in the woods one travels one travels
nahoreda õkero nlaidiʔnkero ntoraiʔnkero ãinkero
one comes to the water one crosses the water one crosses on the way
ãinkero alorekidiʔrekərə aloraiɾiʔkərə
on the way! one takes the prairie one crosses the prairie

In the wet sand travel in the wet sand travel
ʃeinlikəro herhaninuⁿnkəro nungeniⁿnkero
one passes the hut of other people traveling meets others
uelikaⁿmunde ʃiitliⁿtte (b1)
one is united with others here are the huts.

As is seen, the two forms of existence not are only very strikingly opposed from the economic and sociological point of view. They constitute two poles around which accumulate complex ensembles of emotions, sentiments and memories. With the same tenderness with which they caress their wives, the men evoke the type of life defined by the temporary shelter and the eternal basket, where the most incongruous means of subsistence are sparingly scraped, gathered together, caught each day, where one lives cruelly exposed to wind, cold and rain, and which leaves no more lasting trace than the souls of the women, dispersed by the wind and storms, on whose activity it essentially reposes. And almost like the reign of need is opposed to that of liberty, they conceive in a completely different aspect the sedentary life (whose specific and ancient character is still borne witness to the original species which they cultivate), but upon which the unchangeable chain of agricultural operations confers the same character of perpetuity as the reincarnated masculine souls, the durable house of winter time, and the cultivable land which will begin to live and to produce "when the death of its preceding cultivator shall be forgotten." (1) We do not think it possible to draw conclusions, from a work

1. Cf. quotation, p. 112.

having to do exclusively with several sociological and psychological aspects of the life of the Nambikwara, relative to the place one should assign them in the ensemble of South-American cultures. However, the preceding information suffices to show under what form the problem is posed. We are in [129] the presence of a culture which shows linguistic affinities with the Ŝibŝa, and which approaches the Tupi from the double point of view of family organization and religious beliefs, at the same time recalling

157
152

the Gé and the Botocudo in its material culture. (1) In other terms, it

101

1. We do not mention the Botocudo by chance. The term "Nambikwara" seems to be a surname of Tupi origin, with the sense of "large ears" (Nhambikwara). However, the Indians who use this name do not use the "bodoque" or any other ornament bringing on the same malformation. Yet it is possible that the name was originally applied to a tribe—or group of tribes—different from that which finally inherited it. In 1931, the telegraph post of Parecis, located 80 kilometers from Diamantino, was attacked and destroyed by some unknown Indians, who descended from an unexplored region somewhere between the Ariños River and the do Sangre River. Since that time, they have repeated their sorties at irregular intervals, so that it was necessary to change the trail going to Utiarity (on the Papagaio River)about 80 kilometers to the south of the telegraph line. The fires of Indian camps were clearly visible at the time of our passage to Parecis, in January 1939. Thanks to two severed heads, brought back a number of years ago by some garimpeiros (searchers of diamonds) who had a bone to pick with these Indians, it is known that the latter wear in the lobe of the ear and in the lower lip some large disks of light wood which recall those of the Suia and Botocudo. For this reason then, they are now called, by the diamond seekers and the gatherers of rubber of the region, by the name of Beiços de Pau, "Mouths of wood." The story is surprising, for people up to then were convinced that the Paressi had remained the sole occupants of these territories, and they themselves seemed completely ignorant of the presence of these dangerous neighbors. We have not found in literature any reference to the "Beiços de Pau" since the beginning of the 18th century; but at that time there is precise testimony: "Further on there is another tribe called Mahibarez... their language differs only slightly (from that of the Paressi), and they have ears with very long pierced lobes which in some of them hang to the shoulder, these being neighbors of the Paressi... and moreover they carry some short swords made from very strong wood... This people lives toward the northern part"

(Antonio Pires de Campos, "Breve noticia, etc.," Revista do Instituto Historico e Geographico Brasileiro, Vol. 25, 1862, p. 445). Cf. also C. Lévi-Strauss, "The name of the Nambikuara," American Anthropologist, Vol. 47, 1945. 101

is the problem of a syncretistic culture which one finds so frequently in South American ethnology. 157 182

When taken from the geographical point of view, the statement of the problem is easily reconstituted. One may ask one how best to interpret the presence of a nucleus of low cultures placed symmetrically, as regards the tributaries of the right bank of the Amazon, to that which occupied, and still occupies, eastern Brazil. Under the two wings of the "T" which sketches the distribution of far more evolved cultures of the Amazon valley, and the Madeira, with the long vertical zone which extends from the Xingu to the Tocantins, the low level Gé to the east, and the Nambikwara to the west, produce an equilibrium, like isolated islands. In the case of the Nambikwara, a supplementary problem is raised, that of the duality of their culture and their type of life. The latter can be explained either by taking as a basis the most elementary form of adaptation, and by assuming the borrowing of agricultural life from groups of a more evolved culture, or by leaving the higher form as an impoverishment determined by cultural isolation, or by the [130] suppression in particularly inhospitable regions which would have imposed secondary forms of adaptation. However, it is only by an appeal to all the available sources of information which should include, besides sociological studies, the study of the language and the material culture, and by comparison with the groups living in the same geographic atmosphere, that an attempt to interpret these problems can reasonably be undertaken. 121

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

corded among many tribes. Now, what do we find in the chief's case? There is first a monogamous marriage of the cross-cousin type, that is, where the wife belongs to the same generation as her husband. This first wife plays the same part as the monogamous wife in ordinary marriages. She follows the sexual pattern of the division of labor, taking care of the children, doing the cooking, and collecting and gathering wild food. To this marriage are added one or several unions, which, technic[illegible], are true marriages, but of a different type. Usually, the secondary wives belong to a younger generation. The first wife calls them daughters or nieces. Besides, they do not follow the sexual pattern of the division of labor, but share indifferently in men's or women's activities. At the camp, they disdain domestic tasks and remain idle, either playing with the children to whose generation they belong or [illegible]ng with their husband, while the first wife keeps busy with the food and the fire. On the contrary, when the chief leaves on an exploration, a hunt, or some other manly task, they will accompany him and bring him their moral and physical help. These somewhat "tomboy" girls, elected by the chief from among the prettiest and healthiest of the group, are to him rather "girl-friends" than spouses. They live on the basis of an amorous friendship which contrasts strongly with the more conjugal atmosphere of the first marriage.

622 595

This system exerts a tremendous influence upon the whole life of the group. The periodical withdrawal by the chief of young women from the regular cycle of marriages creates a permanent unbalance within the group, between the number of boys and girls of marriageable age. Young men are the chief victims of that situation and must either remain bachelors for several years or marry widows or old women discarded by their husbands. Thus, the right to plural marriages represents a concession of considerable importance made by the group to its leader. What does it mean from the latter's point of view? There is little doubt that access to young and pretty girls brings him a much appreciated gratification, not so much from the physical side (as the Nambikuara share in the quiet dispositions of most South American tribes), as from the psychological and sentimental one. But, above all, plural marriage, together with its distinctive features, constitutes the technical means and the functional device placed at the chief's disposal by the group to enable him to carry out his exacting duties. Left by himself, he could hardly do more than the others. His secondary wives, freed by their special status from the customary

SP17 Nambicuara SP17

622 595 182 liabilities of their sex, are his helpers, comforters and assistants. They are, at the same time, leadership's prize and instrument. Can it be said, from the native point of view, that the prize is worth the trouble? To answer that question, I shall now have to consider the problem from a broader angle, namely, what does this elementary social structure, the Nambikuara band, teach us about leadership, its basis and its function?

121 There is a first point which does not require great elaboration. Nambikuara data contribute, with many others, to destroy the belief originated by early anthropologists, and temporarily revived by psychoanalysis, that the primitive chief could find his prototype in a symbolical father, and that the simpler forms of the State could progressively have grown out of the family. We have found at the root of the crudest forms of chieftainship a decisive step, which introduced something entirely new in respect to biological relations—and this step consists of *consent*. Consent, we have seen, is at the same time the origin and the limit of leadership. Unilateral relations such as right of age, autocratic power, or others, may appear in groups having an already complex structure. In simple forms of social organization, such as the one I have tried to describe, they are inconceivable. Here, on the contrary, the relationship between the chief and the group can be seen as a perpetual process of arbitration where the chief's talents and authority on the one hand and the group's size, cohesion and willingness, on the other, constantly react on and influence each other. If I had the time, and if it were not so far removed from my topic, I would have liked to show what considerable support modern anthropological observations bring, in this respect, to the analysis of the eighteenth century social philosophers. I am well aware of the fact that Rousseau's "social contract," which is the step by which individuals resign their autonomy in favor of the General Will, is entirely different from the nearly contractual relations existing between the chief and his followers. It remains true, however, that Rousseau and his contemporaries displayed a keen sociological feeling when they understood that cultural attitudes and elements such as "contract" and "consent" are not the result of secondary processes, as claimed by their opponents; they are culture's raw materials, and it is impossible to conceive a political or social organization in which they would not already be present. If I understand correctly, the recent analysis, by modern American

593 The conversation becomes animated and laughter spreads. In the dark
182 prairie the camp fires burn. Around the fire, the only protection
462 against the cold which descends, behind the frail windbreak of palms
[342] and branches hastily planted in the ground on the side where wind or
[415] rain is expected; near the baskets filled with poor objects which constitute their whole earthly treasure; lying on the ground which extends around, haunted only by other bands equally hostile and fearful, the couples, embracing tightly, are truly seen as the support of one another, the comfort, the only help against the daily difficulties and the dreamy melancholy invades the Nambikwara soul from time to time. The visitor who camps in the brush with the Indians for the first time feels tenderness as well as anguish and pity before the spectacle of this humanity so completely unprotected; crushed, apparently against the soil of a hostile land by some implacable cataclysm; naked, shivering around the hesitant fires. He circulates tip-toe among the underbrush, in the dark, avoiding crushing in his walk a hand, an arm, a trunk, whose warm reflections are seen by the light of the fires. But this misery is animated by whispering and laughter. [56] The couples clasp one another as in the nostalgia of a lost union. Their caresses, at the same time tender and candid, are not interrupted by the passage of the stranger. One senses in all
[157] of them an immense gentleness, a profound carelessness, a naive and charming animal satisfaction, and, emanating from all that, something like the most moving and credible expression of human tenderness.

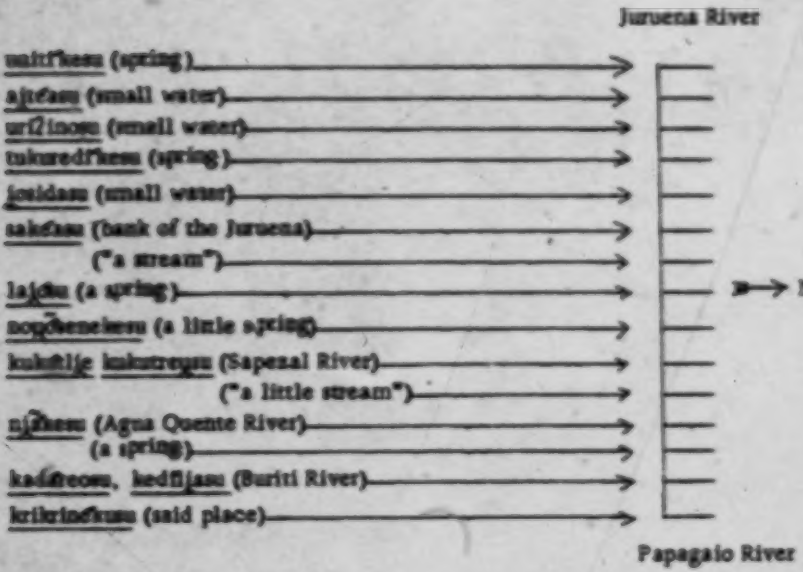
593 Thus it is not surprising that the attitude of the two sexes as con-
831 cerns one another is characterized by intense interest. This interest
462 is translated in certain cases by the vocabulary. In fact the Nambikwara
562 have only one word to express "pretty" and "young," and a single word to
[517] signify "ugly" and "old" (munjene, jeʔene, bl). Their esthetic judgments are thus based essentially on human considerations, and above all, sexual ones. But the interest which is manifested between the sexes is of a complex nature. Men judge women in a mass, as being a little different from themselves. Depending on the situation, they consider them with desire, admiration, or tenderness. In itself the confusion of terms pointed out above constitutes permanent homage. But it must not be forgotten that the form of economic adaptation realized by sexual division of labor a capital role attributes to the women, since family life rests to a very large degree (probably the greatest) on the collecting of the women, but it represents an
● [83] inferior type of activity. The ideal life is conceived on the model of agricultural production or hunting. To have plenty of manioc, and

fat pieces of meat is a constantly relished dream, even though rarely realized. On the other hand, the provisions haphazardly collected are considered—and really are—the daily misery. In Nambikwara folklore, the expression "to eat grasshoppers" (tʃigire ũrrige, bl), a typically feminine and infantile harvest, is nearly equivalent to the French "to eat the mad cow" (to rough it). At the same time the woman is considered a tender and good being, but of the second order. The language which she uses habitually separates her from the men and unites her with the children (in the same way that she collaborates with the children in expeditions of collecting and gleaning). We shall see later that this assimilation also continues into the metaphysical thinking and that, on this latter plan, discrimination between the sexes attains proportions whose psychological attitudes are only a derisive indication. It is considered well-bred for men to speak of women with a pitying good will, and, in conversations between the two sexes, to address them with a slightly mocking indulgence. Certain sayings are heard often among men speaking among themselves:

5. ũrtnoʃunatukhne jo?otnuʃutnãdnjani denesunatukhne. (bl)
The children do not know, I know, the women do not know.

and they bring up the group of women (dosu, al), their jokes, their conversations, with a tone of tenderness and mockery. But, of course, that is only [57] a social attitude. When the man finds himself alone with his wife around the camp fire, he listens to her complaints, considers her demands attentively, asks her help in a hundred undertakings. The male line of talk disappears, and gives way to the collaboration of two partners conscious of the essential value which they have for one another.

This ambiguity of male attitude as regards women has its exact correspondence in the equally ambivalent behavior of the female group. The women think of themselves collectively, and manifest it in several ways. In the first place they do not talk like the men. Even though a sexual language does not exist in the true sense of the word, in conversation a thousand inflections, shades of pronunciation are found which are typically feminine. Women articulate badly and affect a sort of jabbering which is reminiscent of infants' pronunciation. They whisper instead of talking out loud, and emit sounds with an affected mannerism and preciosity which are at times seductive when they are not exasperating. Thus, in dialect al, they give words an ending —ʃu instead of the usual—su or —tu. They also pronounce—kititu, the verbal suffix which is for men, —kedjutu or —kedjuzu.



TRADITION

The Nambikwara have a sharp sense of tradition. We have read above (p. 60) a remark of B1 which shows him to be sadly cognizant of the decline of his race. Customs and techniques are generally considered as legacies of the "ancestors":

58. irõtʃioe ikĩtage ajttige.
"The ancestors taught us how to coil it [the ribbon of rubber meant for making a ball]" (b1).

One single legend was found relating to the origin of the universe. [120] It is that of the Flood, the childrens' version of which we have already given. (1) Here is the text used by adults:

1. See above, p. 69.

59. nardõe kãũhire
narukʃ'ihire naukaurʃ'aure
nahũtende kãng-rage naukãdo urʃ'ere toãdige
the water had descended the water flooded everyone to die

For about seven
221 months these bands go wandering across the prairie in search of small
[222] game, small animals such as caterpillars, spiders, grasshoppers, rodents, snakes, lizards, and so forth, and fruits, grains, roots or wild honey—in short, all that might keep them from dying of hunger. Their camps, set up for one or several days, sometimes for several weeks, consist of as many temporary shelters as families, made of palms or branches stuck in a semi-circle in the sand and connected at the top. This is the period when the quest for food absorbs all activities. The women equip themselves with digging sticks, and
221 the men hunt with the bow and arrow, of which several types must be
411 distinguished. The eastern groups have a bow with a flat section
●184 which evolves toward a convex-plane section or a concave-convex section when one moves westward. As for the arrows, those made for hunting birds have a blunted tip. Arrows for fish have three to five points, each one formed like a minute harpoon, and the stem is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 85.

by a sheath of bamboo, are reserved for hunting monkeys and small game. Those for large game have a long lanceolate point. The barb is attached or sewed on. Besides the bow and arrow, the men use a club
[16] which often takes the form of a javelin, and its use is reserved for magic and war operations (1).

1. Cf. below, p. 99.

824 The primary materials of the indigenous industry consist of varied
825 woods, wax from wild bees, resin, fibers of the buriti palm trees (Mauritia sp.fera) and tucum (Astrocaryum tucuma) bone of the monkey, teeth and claws of mammals, fur (only to make ornaments), feathers, quills of porcupines, vegetable shells and river shells, stones,
412 cotton and grains. As implements they have knives made from a sharp piece of bamboo, from stones crudely fashioned, or from fragments of iron or steel obtained through exchange, and fixed with the aid of wax and cord between two pieces of wood forming the handle. Drills are made of a borer of stone or iron mounted at the end of a stick
[17] which they turn between their palms. The Rondon Commission expanded the use of axes and metal hammers, and the old stone axes serve now only as small anvil blocks for fashioning shell or bone.
[415] The use of stone polishers must also be mentioned and, among the objects of current usage, the spindles, combs, baskets and gourds to carry water.

carry water. Pottery, unknown to the eastern groups, is crude everywhere else. There are neither canoes nor dugouts. The Indians make five different types of musical instruments, all winds, which are often heard in festivals.

The difference in physical appearance between the Nambikwara and their eastern, western and southern neighbors—Paressi, Tupi-Kawahib and the tribes of the Guaporé—is striking. (2) And they

2. The anthropological study of the Nambikwara was the object of research of Dr. J.-A. Vellard, who was part of our expedition.

also differ from most of the other tribes of Brazil, whose physical type is generally more massive than theirs. In the case of the Nambikwara, the body is not exceptionally small; but they are slim, and their long hair, sometimes wavy and of more developed pilosity than the indigenous median, their hands and feet of reduced dimensions, their fine lineaments, and above all their faces, of characteristic outline but very purely chiseled, contribute to form a physical type far removed from that encountered most often in South America, but which reminds one persistently of certain types of southern Mexico and Guatemala, and even more of that characterized by the masks with pointed beards of the region of Vera Cruz.

• • • •

The Nambikwara get up at dawn, stir up the fires, warm themselves as well as they can after the cold of the night, then they eat lightly of the [16] remains of last evening's yucca cakes. A little later the men leave, together or separately, for a hunting expedition. The women remain in the camp where they devote themselves to culinary duties. The first bath is taken when the sun begins to come up. The women and children often bathe together for amusement, and sometimes a fire is lighted before which they crouch to warm themselves on coming out of the water while they playfully exaggerate a natural shivering. Other bathing takes place during the day. The daily occupations vary little. The preparation of food is that which requires the most care and time. Yucca must be ground and pressed, and the pulp dried and cooked. Or else the cumaru nuts (Dipteryx odorata) which add their perfume to most dishes must be shelled and boiled. When the need is felt, women and children go out on foraging expeditions. If the provisions are sufficient, the women spin, crouched

601

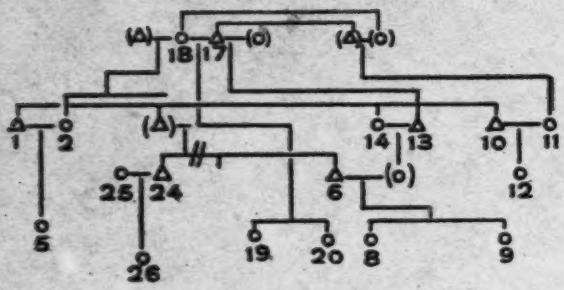


Fig. 9

A17, a man of about 55 years, married a18 (about 50 years) and has by her two daughters, a19 (about 12 years) and a20 (about 6 years). a18 has from a former marriage, a daughter a2 (about 30 years) married to A1 (about 35 years); the latter has taken a son A24 from an older dead brother; this son, himself married and the father of a baby, is about 26 years old. A17 and a18 are then "asoũnosu" and "aɛʔinosu". The daughter a2 of a18 is a "aʔkenosu," mother of a daughter of 8 or 9 years, a5. Under these conditions, the two little girls a19 and a20 are likewise "mothers," and they are called "aʔkenosu" by:

a5 : their contemporary [feminine];
A6 : their elder [masculine] (about 25 years);
a12 : their elder [feminine] (about 22 years);
A24 : their elder [masculine] (about 26 years);

and consequently they are called "grandmother" by:

a8 : their contemporary [feminine] (about 6 years);
a9 : their junior [feminine] (about 3 years);

the daughters of A6; and, in fact, a2, who is a "mother," normally calls them "little sisters."

601 [29] The system of parentage of the central, southern, and west-
● 184 ern groups (dialects b1 and b2) does not present any fundamental difference as concerns the preceding. The degrees of parentage distinguished are less numerous; on the contrary, one finds quite a great variety of terms used to designate a set degree. The fact that the informants use several terms to qualify their situation as concerns a certain subject suggests that these terms are often synonyms, even though their etymological sense is not always perfectly clear.

601 184 Grandparents are most often singled out among themselves, and distinguished from the parents of the spouse, which does not happen in system a (1 or 2); also, the son (or daughter) of the brother (or the of the sister) of the father (or of the mother) are sometimes designated by different terms. The groups studied are not dense enough to be able to make a base for a theory of the system in force. Solutions of replacement intervene frequently, and the preferential forms of marriage found are not adequate for generalizations, due to an insufficient number of cases. But the preceding considerations suggest that preferential unions, choosing also among certain categories of cross-cousins, could formerly have been in force. [582]

Finally, the names for brothers (and sisters), elder and younger, are more changeable than in system a (1 or 2); and one sees appear a new term designating the brother or the sister of the other sex. This disorganization of vocabulary can be interpreted as resulting from the influence of the northern system (dialect c), where we shall see later on that it tends more and more to assimilate the system of groups b. [177]

Here is the vocabulary of parentage used, with references to group a (1/2): [Note: m.s. = man speaking; w.s. = woman speaking; m.w.s. = man or woman speaking.]

Dialect a 1/2	Dialect b 1/2	
ahuĩnosu	1. (ta)mĩnde	(my) father, father's brother.
	2. ẽinde	father (equals man).
	3. uãĩre	father (used to designate absent father, or father of a third person, or the father's brother.
	4. (ta)mĩnlaore	father's brother (equals other father).
	5. (ta)mindũdnere	father (father's brother when he substitutes for dead father).
aʔkẽnosu	6. (ta)nãde	(my) mother, mother's sister.
	7-8. (ta)nãdẽlaore, ndãore	mother (other mother; for the mother's sister and the mother of a third).

601
●184

	9.	denaũdnere	mother (wife of the father's brother. cf. 5)
[30] uettu	10.	uette	child.
	11.	namãde	small child, baby.
a2kiñaru	12.	nkiñaende	son.
	13.	eingire	son (= little man).
	14.	nikilaũdnere	son (used by the father's brother to the brother's son).
a2kiñeru	15.	iñkeninde	daughter.
	16.	deeingire	daughter (= little woman).
	17.	inkãniũdnere	daughter (adopted).
(t)oãnosu	18.	tõaãde	older sister.
	19.	kiruñde	older sister (?).

oyensaesu	25.	(t)uirare	(my) spouse, husband.
	26.	etende	husband (equals man).
	27.	uiñere	husband (when he is absent, or the husband of another).
asuñosu	28.	(t)arute	cross-cousin (masc.), sister's husband (m. s.).
aseetasu	29.	(ta)dedere	cross-cousin (fem.), brother's wife (w. s.).
asineeru	30.	(t)asirare	sister's son, daughter's husband (m. s.).
	31.	(t)asiniñde	brother's son, daughter's husband (w. s.).
	32.	(ta)uriñde	daughter's husband.
asiñtu	33.	siñdare 34. uikiãde	brother's daughter (w. s.), sister's daughter (m. s.) son's wife.
asoũnosu	35.	nduku iñde	
	36.	(ta)kuñde	mother's father, father of spouse.
	37.	õuñde 38. (ta)õnde	father of father or of the mother.

601
184

a2ɛihosu	39. hiʔinde	mother of spouse.
	40. ʔiruinde	mother of the father or of the mother.
asuittu	41. asuite	son (daughter) of the son (or daughter), sister of father (brother of mother) of father or of mother.
asuɛlisu	42. asuiʔarore	children of the son or of the daughter of the brother (w. s.), children of the son or of daughter of the sister (m. s.).

[31] Descriptive terms:

43. uɛikuainde	44. (ta)uiudnere	child of a third person, adopted child.
45. iooɲe		adolescent. (masc.)
46. tiloɲe		adolescent. (fem.)

(For orphan, masculine or feminine, widower, widow, see above, p. 26.)

• • • •

We go now to the system of parentage of the northern group (dialect c):

1. yaĩnko..... father.
2. hĩmi..... father's brother.
3. nauko..... mother, mother's sister.
4. asiãtaba..... father's sister.
5. kooka..... mother's brother, father of the spouse, father of the father or of the mother.
6. sĩ'ko..... wife of the mother's brother, mother of the spouse, mother of the father or of the mother.
7. taãta..... son, sister's son (w. s.), son of a "wife" (m. s.).
8. taãtero..... daughter, sister's daughter (w. s.), daughter of a "wife" (m. s.).
9. aĩinu..... son or daughter of the sister (m. s.).
10. taãmero..... son or daughter of the brother (w. s.).
11. iaja..... older brother or sister.
12. sabãni..... younger brother or sister.
13. iãtta..... wife, daughter of the father's sister, daughter of the mother's sister.

601
184

14.	tiimo.....	husband, son of the father's sister, son of the mother's brother.
15.	iopa.....	sister's husband, wife's brother (m. s.).
16.	ʂiuitta.....	brother's wife, husband's sister (w. s.).
17.	ʂiauitte.....	daughter's husband, (f. p.), daughter's husband, "wife's" husband (m. s.).
18.	ʂinarʂo.....	brother's daughter (w. s.), sister's daughter (m. s.), when she is at the same time wife of the son (m. w. s.) or wife of the younger brother (m. s.).
19.	ʂiuʂi.....	daughter's children.
20.	ʒoeʂo.....	son's child, or of the daughter when the latter is married to an uncle.
21.	zʊa.....	child (married to an uncle).

[97] [32] This vocabulary of relationships apparently does not offer any affinity linguistically with that of dialects a and b; and the structure of the system also seems different. Without doubt the fundamental principle—the marriage of cross-cousins—remains the same. To be convinced of this, it is sufficient to refer to the list of relatives designated by the terms tiimo and iatta. Again one finds the division of members of the same generation into sisters and wives (m. s.), or brothers and husbands (w. s.) on one side, and on the other, sisters and wives of brothers (w. s.), or brothers and husbands of sisters (m. s.). But the distinction here is more confused, since it is accompanied by an absence of symmetry concerning the designation of the brothers and sisters of parents, and the children of the brothers and sisters of the subject. Instead of finding the first divided into fathers and mothers, fathers-in-law and mothers-in-law, and the second into children, and sons-in-law and daughters-in-law, we have a more complicated terminology. The name of the father's sister (asiataba) differs from that of the wife of the mother's brother (ʂiiko), although they are habitually confused in a system of marriage among bilateral cross-cousins. There is also a special name for the father's brother. But, if this latter is a younger brother who has one of his nieces, he will be called brother-in-law (iopa) by his brother's son, his nephew. Even more delicate is the naming of nephews and nieces because the symmetry carried on by the other systems between the children of brother (of a brother) and the children of sister (of a sister) fades out giving way to a new symmetry, this time between the children of sister (of a sister), and the children of the wife (classificatory) of the brother, who are called by the same name. Moreover, the children

601 born respectively from a brother and from a sister receive different
●184 names according to whether they are the sons or daughter of a brother (of a sister), or sons or daughter of a sister (of a brother). Finally, it is no longer normally possible to identify the son-in-law (ŝiauĵtte) and the daughter-in-law (ŝinaĵso) with the nephew or the niece (cross-), and the ŝiuŝi, soeŝo (the same difference as the asuĵttu, asuĵte, and asuelisu or asuiarore of the preceding systems) do not correspond exactly to relatives of the third generation, or to the third degree.

601 184 582 These contrasts are clarified when one studies the forms of marriage actually practiced. Of eight marriages, five are "horizontal," that is uniting a husband and wife coming from the same classificatory generation, and three are "oblique," the husband coming from the generation of his wife's mother:

C1 = c2 : brother's son and sister's daughter (horizontal);
C4 = c5 : husband's brother and wife's sister (horizontal);
C6 = c7 : mother's younger brother and sister's daughter (oblique);
C12 = c13 : mother's older brother and sister's daughter (oblique);
C16 = c17 : mother's younger brother and sister's daughter (oblique);
C20 = c8 : husband's sister and wife's older brother (horizontal);
C20 = c21 : husband's sister and wife's older brother (horizontal);
C29 = c28 : brother's son and sister's daughter (horizontal).

[33] In the absence of genealogical facts, one can even suppose that two of the marriages above, classed as "horizontal," are probably oblique, given the considerable difference in age between the husband and wife (C20 = c8, c21); such is often the case of children issued from "oblique" marriages. But even disregarding this possibility, the proportion of "oblique" relationships rises when one passes from marriages as such to the classificatory relationship of husband and wife. Thus C6, for example, calls "wife":

c2 : wife's sister;
c5 : sister of father's wife;
c7 : his own wife;
c8 : sister of father's wife;
c13 : wife's sister;
c17 : wife's sister;
c21 : sister of father's wife;
c24 : wife's sister;
c31 : wife's sister;

there are actually three horizontal relationships and six oblique (directly or indirectly, through the already oblique position of the intermediary).

We have seen above that the "oblique" marriage is not unknown in the eastern, central, southern and western groups. But it is not so frequent there, and above all, the system of names does not take account of it. The problems resulting from this form of marriage are, then, resolved in two ways: either they preserve the names which have become contradictory, or they displace one or several individuals from the category of kinship to another. The method of the northern system is entirely different, for this is the system whose structure is accommodated to marriage between persons of different generations. (1) This new character is shown by a clearer distinction, 601 582 184

1. For the theoretical interpretation, it will be compared with the Miwok and Ao Naga systems, as we have analyzed them in another work. (Les structures élémentaires de la parenté, ch. 17 and 22.)

within each generation, between the "elder" and the "younger"; in place of four terms distinguishing the relative age and sex, there are only two, iãia and sabãni, which refer to age and apply indifferently to both sexes. Moreover, the term sabãni tends to have the general meaning of "young" or "little," and succeeds in specifying, from this point of view, whatever the kinship relationship is (2) implying

2. Cf. below, p. 37, text No. 1.

thus that the quality of sabãni is equivalent to displacement to another generation. And actually, even though the older brother and the younger brother can equally claim to marry their sister's daughter, the older brother, even when married to his niece, will continue to be called iãia by [34] his wife's mother. On the other hand, in the same situation the younger brother sometimes passes to the rank of ŝiauĩtte; he is no longer considered as a brother, but as a son-in-law. Moreover, if the term ŝiauĩtte normally means a "horizontal" son-in-law, that is a cross-nephew married to a daughter, it is significant that a man calls ŝiauĩtte his younger brother, who has married a niece, and even a "wife"; and that a woman designates a younger brother married to a daughter in the same way, as has just been seen. Nevertheless, a man calls his cross-cousins (fem.) and his sisters' daughters indiscriminately iãtta (wife), while distinguishing the husbands of his "wives" as ŝiauĩtte (horizontal son-in-law), sabãni (or ŝiauĩtte, replacing sabãni) and iãia.

601 It might be considered that these differences as regards the other
184 systems are purely formal. They bring on, however, some important
582 consequences. The preferential marriage between mother's brother and sister's daughter must introduce asymmetry between the children of the brother and those of the sister, thus justifying the use of different names in the two cases. For the same reason, one sees a shift of a classificatory generation appear between a woman who has married an uncle, and that of her parallel cousins. Here is a striking example:

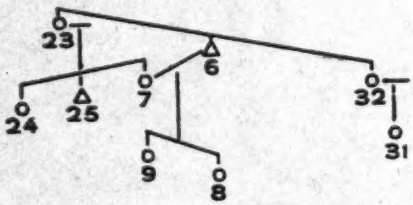

Fig. 10.

c23 calls C6 (in reality, sabãni) ŝiauĩtte; thus her daughter c24 calls him tiĩmo (husband), since he is married to her sister, c7, and their brother C25 calls him jõpa for the same reason. For c23, her granddaughters (and nieces at the same time) c8 and c9 are ŝiuŝi, called taãtero by the sister of the mother c24, and aisinu by the brother of the mother C25. But if one looks at it from the point of view of c31, the essential fact is not, as in the preceding cases, that C6 has married a daughter or a sister (here, a niece or a parallel cousin), but that he is the mother's brother. Consequently, she calls him koõka (father-in-law), and she calls the wife of C6 ŝiĩko (mother-in-law), and the children of the latter become her ŝiuĩtta (sisters-in-law).

A double conclusion can be drawn from this analysis. In the first place, it must be remembered that in systems a and b the term for "older brother or sister" also means parallel cousins. Now we have just established that in the system of group c the parallel cousin can actually be displaced to a younger generation, and that such is the case when the marriage is of the "oblique" type. It may, therefore, be that the oblique marriage has occupied a more important place in systems a and b than is the case today. The second point is that the kinship system of group b, with its use of a special term for the brother or sister of the opposite sex, and its distinction [35] between the parents of spouses and the grandparents, takes an intermediary position

601 between systems a and c. It constitutes a sort of transition between
582 the simple, symmetrical and harmonious system of the eastern groups
184 and the more subtle and complex structure of the northern system. This role corresponds well to the respective geographic positions occupied by the different groups.

CONCRETE STUDY OF THE GROUPS

601 The concrete functioning of the kinship systems previously analyzed has been studied in the following groups:

I. Eastern group (dialects a).

621 (1) Dialect a 1. —A group of 23 individuals composed of six men, nine women, and eight children. This group was found to be temporarily enlarged by the meeting, and sometimes even the temporary combining of bands, whose members present among themselves, and as concerns the first group, analogous kinship relationships. Thus, group (1) was found to be temporarily increased to the point of including 75 individuals (20 men, 30 women, and 25 children).

(2) Dialect a2. —Several small units each including 6 to 12 individuals.

II. South-central group (dialect b1).

A stable group of 17 individuals composed of five men, six women and six children, temporarily increased, by the meeting with relatives, to 31 individuals (13 men, 10 women, and 8 children).

III. Western group (dialect b2).

A group of 12 individuals composed of four men, five women, and three children.

IV. Northern group (dialect c).

A stable group of 34 individuals composed of 9 men, 11 women and 14 children.

128 The concrete study of the groups will be based on the eastern
114 group a1 (restricted) and on the central group b1 (restricted), the only ones with whom we have lived long enough to set forth a psychosociological analysis.

605 But the relationship of "cross-cousins potentially or effectively allied by the marriage of their sister"—which seems to be the most adequate equivalent of the [77] term tarûte—can be extrapolated largely above and beyond family relationships. In certain cases, it is used to create, among individuals without relations, original ties whose role is to fuse, indirectly, in a same family group, groups formerly heterogenous. It was noted 621 at the beginning of this work (1) that the central and southern 182 184

1. See p. 6.

groups have decreased quite considerably owing to the epidemics of the last fifteen years. Some of them have seen their power reduced to such a degree that the following of an independent social existence in such conditions might seem an illusory objective. Certain ones then grouped together in the hope of reconstituting a workable unity. Thus it is that when we found them the group designated under the title b1 (restricted), comprising 18 persons, and group c, comprising 34 persons, lived together, under the authority of their respective chiefs, but these working together. It is to be presumed also that the decrease in number was not the only reason for that alliance, and that group c represented a fraction of a more numerous group which it had been forced to flee for an undetermined reason. It probably sought greater security in the nomad's life shared with group b1. Some rather obscure events (2) which occurred

2. See p. 103.

during our stay let us glimpse the political background whose details we do not know. Whatever the case may be, the two groups traveled together, camped at the same times, but without mixing their fires, the constituent families forming two adjacent agglomerations. The most surprising trait of this or- [91] ganization was that the two groups did not speak the same language and could not communicate with one another except through one or two individuals belonging to each group who acted as interpreters. Notably, no direct communication existed between B1, chief of the Tarundé, and his colleague C20, chief and shaman of group Sabané. In fact, if there is

In fact, if there is
621 no doubt concerning the close affinity of dialects a1, a2, b1 and b2,
[197] which do not differ among themselves except as the derivations
182 of a mother language, dialect c offers, as regards the preceding,
184 such profound differences that one does not know if one is in the presence of a language of the same family. In any case, in whatever way linguistic study might resolve this problem, it can be reasonably set forth. We do not hesitate, nevertheless (and in spite of anthropological differences), to place group c in the cultural family of the Nambikwara, because of the identity of material culture and way of life, and especially because of the psychological attitude of groups b1, b2 and c as regards one another, who ostensibly recognize their community.

621 The union of the two groups posed a problem, that of the
605 nature of the relationships which would go on between their respective members. This problem [78] has been resolved by the recognition of all male members of group c as being "cross-cousins"—tarûte, of all the adult males of group b1, and of all the adult males of group b1 as being the jôpa (corresponding to "cross-cousin" in the vocabulary of parentage of group c) of all the adult males of group c. The result, consequently, is that if all the husbands of the two groups are "brothers-in-law among themselves," all the "wives" of a group are "sisters" of the husbands of the other, and all the children of both sexes, in a group, potential husbands or wives of the infants of the other group belonging to the opposite sex. The blood fusion of the two groups is thus definitely assured for the following generation. Here is a type situation which one finds thus realized:

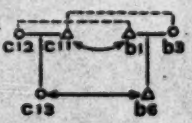

Fig. 18.

The systematic character of this solution is not doubtful. The informants belonging to group b or to group c, when we interrogated them concerning their kinship relationship regarding a male adult of the allied group, never furnished us with a special answer concerning the considered case, but remarked

622 The command carries, moreover, a certain number of fixed offices. It is the chief who makes the poison for arrows; and he presides over ceremonies of initiation, of marriage or burial, concerning which we shall speak later. He organizes chants and dances, festivals both when they assume a ritual character, and when they have as a goal purely secular distraction. It is he who organizes 622 ball games. The ball game is widespread in western and northern 526 Mato Grosso, for it is found from the Paressi to the tribes of the Lower Guaporé. Among the latter people we have been able to gather evidences of its sociological significance. It is perhaps the same among the Nambikwara; but, at least during the period of nomadic life, the ball game is practiced with a purely recreational goal in mind. The teams are built up haphazardly from those present and upon the spur of the moment, and the game takes place in a spirit of complete improvisation.

WAR AND TRADE

648 The two subjects should be treated simultaneously, commercial 609 exchanges usually representing potential wars peacefully re-[91] 439 solved, and the wars, the outcome of unhappy transactions. Among the numerous bands which cross through the bush during the dry season, it is necessary to distinguish those who are related by family ties, and who often represent the population of a winter village—or of a group of villages—which has "burst forth" in the pursuit of the nomadic life. Among themselves these bands entertain relationships which are normally pacific, although not necessarily so. On the contrary, bands which are strangers to one another, composed of members not related among themselves and whose geographic location is far distant, or who are even separated by differences of language, mistrust one another at the same time that they feel themselves necessary to one another. Only when they meet can they procure desirable articles which only one of them is capable of obtaining or of making. These articles seemed to us to belong essentially to three categories: first of all women, whom only victorious expeditions are permitted to carry off. Next seeds, notably bean seeds, and finally ceramics, or [283] even fragments of pottery used to make the weights of spindles. Group [84] a1 whose cultural level is clearly inferior (especially in its ignorance concerning pottery) to that of its western and southern neighbors, according to the word of its chief, had carried on several campaigns during the last few years with the goal of procuring these two last articles.

684 626 [182] conscious function the bringing of psychological compensations incommensurable among themselves, rather than for establishing equivalences of value.

764 184 The Nambikwara have two types of burial. The eastern groups practice double interment. The bodies are first placed in a crouching position (ãriuaerekititu, a1) in a circular ditch (sinitakurisu, a1) seven feet deep heaped up with earth and branches. For two months, they sing, dance and weep around this provisional tomb, until the body is decomposed. Then the bones are carried to the river where they are carefully washed. Then they are carried in [768] a cloth to be permanently buried in the village. The village is then abandoned, but the site is often visited:

53. auregande aŝunikere kadukɔrage iaudrige ende ende ende inare inaretaire ŝinoribate (b1)
to dig the grave, to close it, to wait one moon, one moon, one moon, to take out the bones, to bury them in the village.

In the central groups, on the other hand, the bodies would be buried (aoʔenikere, b1) in a prone position (iotarige, b1).

The funeral rites distinguish between movable goods and immovable goods. The first are carefully destroyed; they break and burn the weapons; they unravel the beads and necklaces.

[768] The garden of the dead man, if he cultivated one, is, however, only abandoned, and can be reclaimed later:

54. doŝore dutige adrede autadatige audotahãmdige audotaãmde odenehẽire odunhĩnde niaotumnie narainidãnde naraidutrige aitredugeiottige den den den nagiaode aire dugiotige tiatugiotige (b1)
The arrows are broken, everything must be broken the beads are unstrung, the beads of the deceased, the fields of the deceased are abandoned one moon, one moon, one moon, and when all is forgotten, another takes the field.

423 Yet it is necessary to avoid confusion on this point. Strictly speaking, there is no land property among the Nambikwara. The chief invites his men to group together to cultivate the gardens, but sometimes such and such an individual decides to clear a field on his own account. These personal appropriations do not give rise to any incidents since the cultivatable land is usually far larger than the collective needs. However, a garden represents a value, because of the considerable amount of work spent in clearing it, especially for people who have never seen metal tools until 30 years ago. Also the rule of destruction of the goods of the deceased respects the

224 to me not to say anything. Later that day he
264 returned to the spot, built a fire, roasted the snake, and ate it by himself.

224 Caymans are hunted by first finding their hide-outs under logs or overhanging banks. When one is found under an overhanging bank the hunters peel a number of slender poles and begin to thrust them down through the bank to force the cayman out. Men are stationed above and below the spot, and as the cayman comes out he is shot. When he hides under logs the hunters feel for him with their feet. The hunters are so nimble that few of them get bitten. The large rodent, paca, is also hunted in this way, for it hides in holes under overhanging banks.

The large water snake, anaconda, is hunted in pools where it lies in wait for game. When the hunters have trailed an anaconda to a water hole they keep shooting arrows into the water until they strike it. The first strike then indicates where the snake is, and they continue shooting until the snake weakens and can be pulled out. Sometimes the snake grabs a hunter by the arm, but the others are there to assist if anyone gets into difficulties.

Small anteaters are dug out of holes but the larger kind which does not go into holes is hunted by two men armed with clubs. The men chase it, one on each side, and as the anteater turns on one he strikes it on the nose with his club and then jumps into a tree. The other hunter then strikes it. This continues until the anteater dies.

Monkeys are chased from tree to tree until they tire and come down to hide in a hole in the ground. Dogs can then overtake the monkey or he can be shot or dug out of the hole. Deer usually do not fall when shot, but the hunter chases the wounded deer until he can shoot more arrows into it, especially into the legs.

[278
● 184] Although the Western Nambicuara are said to use arrows poisoned with curare, the Waklítisu say they do not use curare but that they know how to prepare it and that they formerly used it in raids. As arrows do not penetrate bone, the hunter tries to shoot at an angle so that the arrow will enter the chest cavity, or he will aim between the neck and the shoulder bone.

223 The Nambicuara hunt and eat all birds except the urubú. Large rheas are not hunted because it is difficult to approach them on the open sa-

411 thickness in the middle. This bow is made from the honey-colored heartwood of a small piuva tree. After cutting a piece of the required length the bow maker splits it by using two or three axes. He then trims off the outer layer of wood with an ax, shapes it with a knife, and polishes it with lixeiro leaves. The inner side of the bow is flat or slightly concave, depending upon how the wood splits. Shoulders are made at each end to hold the bowstring. The bow is made from green wood, no attempt being made to season it. The siriva bow is the same shape and is made in the same way but
● [184] the black wood surrounding the center is used. The siriva bow is more common among the Western Nambicuara.

[283] The bowstring (*kalunwiniɨu*) is made from tucum fiber and is about one-eighth of an inch in thickness. The cord is much longer than required and the extra length is wound around the bow for about 6 inches just above the hand hold. The cord is wound from left to right, the running end being brought back over the previous turn to form a cross on the inside of the bow. The string is always smeared with urucú (*dúse*). As the bowstring wears out it is not removed but new lengths of tucum fiber are woven into the extra length.

The basis of the Eastern Nambicuara arrow is the jointless shaft (*alukwirikatu*), which appears to be cane (*Gadua* sp.). Before being made into an arrow the cane shaft is heated over a fire to harden it. Into this cane shaft, which is roughly three-eighths of an inch in diameter, a piuva foreshaft (*ihdikatsutu*) is inserted for a distance of 4 or 5 inches, leaving about 20 inches protruding. The joint is wound with sipó vine for about
[237] 6 inches. To feather the arrow, a 10-inch macaw feather (*akinéntsu*) is split and the halves are laid parallel to one another on opposite sides of the
[284] butt end of the shaft. The feathers are lashed to the shaft with cotton twine, the lashings being about an inch apart. Although the feathers are laid straight along the shaft, they assume a propellerlike pitch which gives the arrow its revolving
[237] motion when in flight. The lashings are covered with beeswax. The butt has a V-notch to hold
[284] the bowstring, which is again tightly wound with waxed cotton twine. By attaching various parts to the end of the foreshaft, four different kinds of arrows about 5 feet long are made.

[p.93(2)]

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéra, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákorê and Ouihanierê to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guaycurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoákorê, and who, as now stated, are Nhambiquára. This name of Uáikoákorê is given by the Parecí of the sub-tribes Kaxinití and Uaimaré of the rivers Arinos, Sacuriú-iná, Tahura-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Caluçal and Jauxú. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of coconut. They wear armlets, bracelets, leg ornaments and bead collars made from the fruit of the mbacúba. They live by the chase, but also plant maize, yams, potatoes, mandioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atziri and the Amúéas of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kêtêhê of the Parecí, made from pounded mandioc. The native *breu* or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Oanini and wax, and is preserved in leaves of the Malá-malá palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutúm feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 28 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malá-malá and bees. The upper disk has three orifices.

sometimes the fathers of several children, walking together at dusk and tenderly embracing each other; always

tardiç ialásiçi

(these are) brothers-in-law embracing (each other).

Certain games, too, such as the "scratch game" (in which the opponents try to scratch each other especially in the face), are commonly played by brothers-in-law.

But the close relationship between "cross cousins actually or potentially allied through a sister's marriage"—the more accurate translation of the aboriginal term for brother-in-law—may extend far beyond the family tie. Actually, it is sometimes used to establish between individuals not belonging to the same kin group new links of a special nature, the function of which is to amalgamate into a single familial unit several formerly unrelated groups. This is brought out clearly in the following case.

During the past twenty years, several epidemics nearly destroyed the central, northern and western divisions of the Nambikuara. Several groups were decimated to such an extent that they could no longer successfully maintain a socially autonomous existence. In the hope of reconstituting functioning units, some of these, therefore, attempted to join forces, In the course of our field-work we met and worked with such a merged group made up of seventeen individuals using the northern dialect (*Sabáne* group) and thirty-four using the central dialect (*Tarãnde* group). Each of the originally distinct groups, however, lived under the guidance of its own chief, although both leaders closely cooperated. It is probable that the demographic crisis did not by itself account for this situation, since the people of the second group formed merely a fraction of a more numerous unit from which it had split off for reasons unknown to us. However, from several events which occurred during our stay with them, we deduced that the break had been caused by political dissention, the details of which remained obscure to us. In any event, these groups now travelled and lived together although two separate but contiguous camps were maintained in which the families formed distinct circles, each around its own fire. The most amazing feature of this curious organization was that the two groups did not speak the same language and were able to understand one another only through interpreters; fortunately, one or two individuals belonging to each group had sufficient knowledge of the other dialect to act as intermediaries. Even the two chiefs could not communicate directly. The problem of whether these dialects belong to the same linguistic stock need not be raised here; but the Northern group undoubtedly must be classified with the Nambikuara cultural family because of the similarities of material culture and of the life pattern, and chiefly because of the psychological attitude of the people, who very evidently believed in their close affinity to the Central group.

145 It seemed to me that these people get their full set of teeth much earlier.

Those molars which are popularly called wisdom teeth, and which are tending to disappear in the white race, are no mere ornaments among the Indians. They are endowed with significant size and function.

264 I believe that the excessive amount of work required of their
145 digestive system is reflected in these dental characteristics. The large molars appear earlier because they are needed for frequent and powerful mastication.

262 They always eat of everything, without discrimination or restraint. To my knowledge, there is no animal they will not eat. They discard only the intestinal tract of the game they kill.

[192] The Indians of the Juruena River consume more meat than the
[514] others; those from José Bonifácio eat more manioc and maize. Their intestinal gas makes their company unpleasant. They all have furred
164 tongues, and many have gums affected by alveolar piorrhea. Their teeth, contrary to frequent cases among the Sambaqui skulls, do not suffer from the state of wear which Lund described in 1842 for Lagoa Santa man; but they suffer from caries which do not spare the crowns.

A special skin disease prevails among the Indians of the Serra do Norte. (1)

[113]

1. See E. Roquette-Pinto, Lectures at the Biblioteca Nacional [National Library] on March 15, 1913, and at the Sociedade Brasileira de Dermatologia, Policlinica Geral do Rio de Janeiro [Brazilian Dermatological Society, Main Polyclinic of Rio de Janeiro], on June 11, 1912.

[181] Actually, some officials of the Rondon Commission had noticed the characteristic scabs of the disease. Owing perhaps to a lack of typical cases such as I witnessed, however, they took the spots
[513] to be mere skin exfoliations caused by the friction of the body on the ground, where the Serra do Norte Indians sleep.

273 the usual process: they masticate manioc or maize and allow the mush to ferment in large pots. One drink thus extracted from the wild pineapple was held in high regard by the personnel of the Telegraph Line.

[262] They are especially fond of monkey meat--a last vestige,
266 perhaps, of their former cannibalistic tastes.

I do not think that cannibalism still exists among them. But I believe that it has not been long since the habit was lost.

It is true, nevertheless, that they often accuse one another of this practice; they make such accusations in a perfectly clear manner, by means of unequivocal signs.

272 [233] They make fire by rubbing together two rods similar to those found elsewhere in Brazil.

This procedure takes much longer than might be expected.

The Indian begins by placing a dry leaf upon the ground; upon it he rests the "stationary fire stick," which he supports with his foot and knee.

[Fig. 26]

Holding the "movable fire stick" between the palms of his hands, he imparts to it the necessary rotary motion, bearing down with it at the same time against the other stick. This motion forces the hands downward along the rod; [when he gets to the bottom], the Indian starts again from the top. Now and then he stops briefly to lick his palm, which smarts from the friction. After a while, when sweat is already beading his forehead, a spark strikes up among the tinder which has been deposited on the leaf.

This process differs from the classical technique only by the presence of the protective leaf.

Because this procedure is laborious, the Indians carry it out with reluctance. Desirous of obtaining a film which would document all their routine activities, I had great difficulty in persuading an Indian to make fire. This is the reason why, of all gifts, matches are among those valued most highly: to make fire after their fashion on a rainy day or in humid weather is a hard and laborious task.

[263] The Tagnani and Tawite also eat a certain kind of mushroom (Polyporus sp.) which the others disregard.

261 which they covered themselves, squatting in a circle beneath the leaves and singing all the while. After a long time they rose, and with the branches still tied to their backs they started dancing around their catch, which was later carved.

115 Unhappily, Gouveia was of an amazing inadequacy. He had lived among them, a captive, for six months; he had actually married an Indian woman, who had tried her best to teach him the language of her forefathers. Yet in the end he fled, bringing back only the vaguest sort of information such as the above, which nevertheless I have deemed proper to record here.

276 Of the stimulants customarily used by primitive peoples, tobacco is the most important [among the Nambicuara] aside from those alcoholic beverages which have already been mentioned.

I have stated earlier that they dry the leaves between two pieces of wood which they stick into the house thatch; when they wish to smoke, they take a leaf and crumble it between their fingers, rolling up the dust in another leaf plucked from a tree which the Cocozu call enandzü.

[238] They also keep tobacco by reducing the leaves to dust which they store in special gourds.

[Fig. 28]

[177] Prior to the arrival of the Rondon Commission, the pipe was unknown among the people of the Serra do Norte. Even today they do not like it and prefer their cigarettes, which are small and quite unlike the huge rolls of some Amazon tribes. [Fig. 30]

Their tobacco (Nicotiana tabacum) is mild and pleasantly scented. On journeys they always carry gourds filled with tobacco dust, or sticks with tobacco leaves; if they feel like smoking somewhere along the way, they stop and form a circle. They proceed as if they were about to have a meal and kindle a small fire. When the cigarettes are finished they continue on their way.

They are extremely fond of our roll tobacco, especially when made into cigarettes with pieces of newspaper...

291 The Indians of the Serra do Norte go naked. Both men and
● 194 women wear a straw cord around the hips. The Cocozu wear bands of embira around the wrists and upper arms, below the knees and

around the ankles. The Tagnani and Tawite wear similar bands on their upper and lower limbs; theirs, however, are made of cotton, which is used occasionally by the Cocozu to manufacture articles of this sort. [Plates p. 242.] Among the Tagnani and Tawite [239], men often cover their sexual organs with the ends of the straw cord that encloses their hips. But this is not the rule. The Uaintaçu rarely wear any of those bands; and among all groups, a few of the Indians always go completely naked.

[Fig. 29]

The women and pubescent girls, young and old, single and married, always wear the hip cord.

Some pregnant women I saw did not wear it; I believe they had freed their abdomen from this strong pressure in order to breathe more easily, or perhaps for fear that the girdle should have a pernicious influence on the foetus.

They always wear their hair long, hanging over the shoulders; they clip it irregularly on the forehead with a bivalve shell or a cane splinter. They liked to have us cut it with scissors.

They are extremely fond of the hats we wear; it seemed to me that the heat of the sun on their head distressed them greatly. They will give almost as much for a hat as for an iron axe.

One of the jaguar-hide helmets which are now in the [National] Museum was obtained in the village of Urutau in exchange for an old and well-worn hat of ours, in spite of the fact that those helmets are highly prized [by the Indians].

They do not normally wear hide or feather head ornaments. When they are in a festive mood, they cover themselves with crowns [diadems] that will be described later, or with jaguar-hide helmets. It is likely that they also use such ornaments for certain ceremonies, but we ascertained nothing about this.

[Fig. 32]

[240] From their ears they hang triangles of mother-*of*-pearl, which they extract from river shells; when the hole tears, splitting the lobe in two, they do not hesitate to bore another one.

The men are much vainer than the women; they adorn themselves with feather diadems, earrings, pendants and necklaces, while the women limit themselves to a few of these.

301 imitate our wedding rings; necklaces [242], several meters long, made of black beads; the feathers of black birds; the limbs of coleopters, also black; all attest to this preference.

[Fig. 45]

[237] The women make beautiful one-piece bracelets from the tail rings of the giant armadillo which they polish with wet stones. [See Fig. 65, p. 59A.]

[184] The Uaintaçu Nambicuara, who come to Campos Novos by way of the Guaporé and who are much more insolent, crude, wary and suspicious, do not attempt to wear the delicate lip plugs used by their relatives.

Some of them wear a porcupine quill fastened to their lip; others, a wooden splinter or a spike from some tree.

291 562 Also characteristic of the whole Serra do Norte and Juruena Valley is a palm-fiber cape (ialaçu), which hangs down the backbone from the neck. [See Fig. 66, p. 59B.] Women do not wear it; it is another example of male foppishness.

302 Body painting with urucu constitutes part of the ornamentation for men as well as for women.

[Plates, p. 236]

[243] They paint themselves on festive occasions; they do not draw lines on the skin, but smear the dye all over their face. Women, [545] after bathing, redden their whole body in this fashion.

[Fig. 44]

[384] The Indians of the Juruena dissolve the urucu powder in pure water; the Tagnani prepare a paste or cream by mixing the dye with the fat of various animals, and perfume it quite pleasantly by way of some unknown process. (1)

1. The Bororo use mastic resin to perfume the urucu paste. See Alfredo de Andrade, "Estudo dos materiaes corantes [A Study of Coloring Materials]," Archivos do Museu Nacional, Vol. 28, p. 183.

535 The circling began at seven o'clock in the evening, with continuous chanting. The girls, not once deviating from their course, left regular marks on the dusty ground which were clearly visible in the moonlight. They seemed always to step in the footprints of the first round. Midnight. Near the fires lit by every family, the old people slept; some muttered and poked the embers which gleamed like scattered rubies. Within the circle, perspiring, covered with dust, more dead than alive, we all joined in the chorus: "Tagnanî-i! Tagnaní-i! Tangrê!"

Thus it went on all night. Whenever one of us fled and repaired to his hammock, two or three big husky fellows would come talking volubly, and drive the deserter back to his place...

[82] Unfortunately the words of those chants were not recorded. We only know the two words cited: tagnani, the name of the tribe, tangre, which means "star." Was this astrolatry? The three central figures of this dance, in the course of which stars were mentioned, brought to my mind [255] the beautiful constellation of Orion with its Três Marias ["Three Maries"--the Belt].

533 I recorded two Cocozu musical pieces which are rendered here [pp. 73-74]. Prof. Astolpho Tavares has transcribed them into musical notation.

[Fig. 34]

The scale [diapasão] of Nambicuara music is about half a tone lower than our normal scale.

The notes used in the recorded pieces are: do^1, mi^{2b}, fa^2, fa^2 , sol^2, la^2. Neither re nor si appear.

The recorded pieces are in la flat major shifting to mi flat minor (Recording No. 1), and in mi minor (Recording No. 2).

The musical motifs develop in two-part time.

184 The Serra do Norte Indians present two distinct kinds of social organization. From this standpoint, the Tagnani and Tawite are more advanced than the Cocozu and Anunze.

593 [211] The latter live under a patriarchal regime: the father rules the family, which is often monogamous. The children, after puberty, start new families according to their own wishes [a vontade] and continue to revere their progenitors.

/211 cont./

114 278 True curares are becoming difficult to find. Many of the modern products brought back as curares or existing under this name in /212/ trade are paralyzing poisons of variable toxicity but with a weak or no curarizing effect. The curarizing effect itself does not interest the Indian; he is only looking for a halting poison producing rapid paralysis with loosening of muscular tonus, no matter by what mechanism, for his arrows. Often also the good faith of travelers has been betrayed and the Indians, anxious about their secret, have given them false recipes or poisons different from true curare. Lastly, some curares are hard to preserve, making it impossible to ascertain their properties upon the return of expeditions.

These causes, so diverse, have always left doubt about the exact composition and method of preparation of curare.

I. Curare of the Ñambikwara /Nambicuara/

During my last trip to the central plateau of the Mato Grosso with my colleague Lévi-Strauss, I was present at the preparation of a very simple but active curare by the Ñambikwara and accompanied these Indians on the search for the necessary plants.

Curare had not been mentioned as existing among the Ñambikwara. The Rondon Commission had certainly observed the existence of an arrow poison among them, but later investigations carried out on arrows sent to Rio de Janeiro had given negative results (Alvaro Ozorio de Almeida and Roquette Pinto). The cause of this failure can only be attributed to the material used in the experiments, which was too old; the arrows keep their activity only a few weeks.

278 184 The composition of curare is the same for all the Ñambikwara, but its method of preparation varies from group to group. It must be emphasized that the preparation of this poison is surrounded with more mystery as one goes toward the

/212 cont./

278 184 southern boundary of the territory of these Indians toward the Amazon. Among the most remote Ñambikwara, those on the right bank of the Rio Juruena whose material culture is extremely poor and who do not have a sorcerer, all the men know how to prepare curare. Among the Tagnani living in the region of Campos Novos and the Rio October 12 and the Çabanè living between the campos of Vilhena and the Rio Commémoration, the preparation of curare is reserved either for the chief or more often for the sorcerer (Çabanè). The Tamandé of the Roosevelt River have refused to give any precise information on curare, the preparation of which is the exclusive prerogative of the sorcerer; their arrow poison, which I was able to study, is identical to that of the other groups. The Ñambikwara of the Cabixi River also use curare, but I did not obtain /213/ any details about its preparation from these Indians, who visited our camp but spent only one evening there.

278 126 I was present at the preparation of curare for the first time among the Ñambikwara of the right bank of the Rio Juruena.

[114] Among the objects gathered for our collections were several poisoned arrows. The first experiments carried out on various animals either with the arrows or with the wash-water of the points revealed a symptomatology recalling that of curare.

[116] [117] Our two chief informants, who were called José Maria and Julio by the civilized people, were influential personages in the group and the principal authors of the massacre of the North American, Protestant mission of the Juruena in 1930.

[123] Patient negotiations led them to show me the plant used by them, and then a little later, to let me be present at the preparation of the poison itself.

Not without fear of being hoaxed, I tested the prepared product: its action was identical in every respect to that of the arrow poisons. The Ñambikwara had been honest.

[114] [162] Two months later in the campos of Vilhena the Çabanè sorcerer, who belonged to the mixed group composed of the

605 But the relationship of "cross-cousins potentially or effectively allied by the marriage of their sister"—which seems to be the most adequate equivalent of the [77] term tarũte—can be extrapolated largely above and beyond family relationships. In certain cases, it is used to create, among individuals without relations, original ties whose role is to fuse, indirectly, in a same family group, groups formerly heterogenous. It was noted
621 at the beginning of this work (1) that the central and southern
182
184

1. See p. 6.

groups have decreased quite considerably owing to the epidemics of the last fifteen years. Some of them have seen their power reduced to such a degree that the following of an independent social existence in such conditions might seem an illusory objective. Certain ones then grouped together in the hope of reconstituting a workable unity. Thus it is that when we found them the group designated under the title b1 (restricted), comprising 18 persons, and group c, comprising 34 persons, lived together, under the authority of their respective chiefs, but these working together. It is to be presumed also that the decrease in number was not the only reason for that alliance, and that group c represented a fraction of a more numerous group which it had been forced to flee for an undetermined reason. It probably sought greater security in the nomad's life shared with group b1. Some rather obscure events (2) which occurred

2. See p. 103.

during our stay let us glimpse the political background whose details we do not know. Whatever the case may be, the two groups traveled together, camped at the same times, but without mixing their fires, the constituent families forming two adjacent agglomerations. The most surprising trait of this or-
● [91] ganization was that the two groups did not speak the same language and could not communicate with one another except through one or two individuals belonging to each group who acted as interpreters. Notably, no direct communication existed between B1, chief of the Tarundé, and his colleague C20, chief and shaman of group Sabané. In fact, if there is

857 iõndage ʂutẽnturu kajãno kajãn kajãn hõte kajãnde ʂutentere kuajkano (b1).

When I am big, I shall catch the caetetu, caetetu, caetetu, the monkey, the caetetus, I shall kill them when it (the dog) barks.

[868] She makes an error in grammar which the father points out
857 laughingly: she should have said tilõdage, "when I am big,"
154 instead of the masculine form she used. The error is interesting, placed in context, which manifestly shows a feminine desire to raise the economic activities reserved for that sex to the level of those which are the men's privilege. As the exact sense of ʂutẽntere is "to kill by beating with a stick or club" (here, the digging stick), the informant tries unconsciously to identify [71] feminine collecting and gathering (which can only aim at the capture of small animals) with the masculine hunt, armed with bow and arrows.

593 The relationships between brothers and sisters have not given rise to any particular observation. In the central and southern group, one finds a special expression to designate the brother of the same sex, nlaõre, "the other one"; this term is not only applied to kinship relationships, but also designates objects be-
[342] longing to the same type. Thus the five or six poles planted obliquely which fan out from the center, and which hold up the
[534] first skeleton of the hut, are called indeléaore; likewise, the double (kalõde) or triple (lutandione) pipes or whistles. Friendly
857 groups are said to be "brothers" (1) also, and in discussions

1. See p. 92.

between adversaries they use the exclamation:

17. kakõtiane tãkanaãtiane (b1).

Wicked one! You are no longer my brother!

[92] which indicates that among the Nambikwara the term "brother" has the same wide sense which it possesses in our vocabulary.
857 But in the heart of the infantile society, numerous attitudes take
182 form which prepare or advance later relationships. The orphan baby a9 spends nearly the whole day in the hands of her young sister a8 (one is 2 to 3 years old, the other 6 to 7). Her sister takes care of her, carries her, feeds her. a19 and a20 (who are "mothers") act like elders toward these two children, in a way more marked than the real difference in age calls for. In fact, a8 and a20 are contemporaries. The eldest, a19,cracks bacaiuva

789 of warm air, aided by small fragments of paper put over a fire, was at least accepted, is not understood. And as usual when it is a question of excusing an incident (which could have had very unhappy [562] consequences), they put all the blame on the women, "who do not understand anything," "were afraid" and feared a thousand calamities. (1)

1. Later, A1 asked for some balloons to give a demonstration himself before the combined groups assembled by him. But, less forgetful than he, we obstinately refused.

● [192] Two conclusions are gleaned from these facts. The first is that the term of nãnde covers much more than the strict meaning of the word "poison," and that it includes all types of actions of exceptional and likewise menacing character, as well as the products or objects likely to determine this action. All nãnde objects and operations have a common character, expressed by the term kakore. This means the dangerous products or substances, and, at the same time, those of a menacing or dangerous nature which certain living beings may possess by specific or only temporary right. Thus poison, the snake, the poisonous spider, the jaguar, are kakore; but the same is true of an enemy tribe, or an Indian (even if he is a [98] relative or friend) when he projects revenge or is found in a state of violent anger. The second conclusion is that the poisons, whatever may be the positive and utilitarian character of their preparation, are not thought of scientifically as substances provoking physiological disorders, but as vehicles or receptacles of that mysterious force which turns the usual order of phenomena upside down. Nevertheless, nãnde is not conceived of in the abstract form of a power. It resides in, and cannot be separated from, certain apparently recognizable material aspects. When the Indians examined our balloons of silk paper, they sought something there which would be the concrete sign of their magical and malevolent nature; and while they proceeded with their inspection, we wondered anxiously what could be the specific characteristics (happily absent) of the product or the nãnde object. If it is true that the sense of the term nãnde is more complex than that of the word poison, it is no less necessary to recognize that poison carries the better example and the more perfect illustration of the Indian conception. It is a clearly identified substance, and recognizable by its outward characteristics to which its evil effects necessarily correspond.

796

alãgena haĩtige (b1)
to sing in the place.

534 A very strict taboo rests on the flageolets. Only the adult
784 men can play them:

46. ũĩtnore ũĩtnia imagɔre.
Children do not know how to play the flageolet.

And the sight of the instruments is rigorously forbidden the women:

denaãtie ĩatiaeninĩnena ednaso iãineni (b1)
the women cannot see them, only the men see.

These flageolets are made in great secrecy, in the same place where they find suitable bamboo. If the musical expedition returns by day, they hide the flageolets in the branches of a tree not far from the camp or from the village. They only bring them out at night, at the moment of the concert, and the women must then retire to the huts or under the shelters, and hide their heads in
[688] their arms. If one of them violates the taboo, they claim she would be pursued by all the men and killed by blows of a stick. We did not have the chance to attend one of these festivals, but, as we desired to collect the musical repertory of the flageolets, we were able, with a certain amount of difficulty, to arrange it so that a mission was sent to find bamboo and make instruments for us (it was necessary to go about 15 kilometers). Having left in the morning, the group returned in the middle of the night, and until daylight we made music some distance from the camp in order to avoid all feminine indis-
[534] cretion. As each instrument sounds a little different from the others, the playing produces an illusion of harmony which is added to the charm of the melody, in itself very real.

534 It is possible that all the musical instruments of the Nambikwara
789 are connected to activities of an economic-social character. Some testimonials, a decisive confirmation of which I was not able to obtain, present the nasal flutes (arãtasu, a2) as meant to assure a rich harvest of the fruit piquy. The season of piquy, which grows in
[222] abundance in the plains, is actually an impatiently awaited period for the Indians. The fruit is admiringly weighed and said to have "lots of fat." Likewise the flutes of Pan (asinzu, a1; juauzere, b1) would be employed in the rites preceding hunting expeditions. In
● [192] the case of nasal flutes, a double analogy has been pointed out by certain informants between their form and that [106] of the pit of the piquy, and between their name and the name of the piquy (ahãru, a 1/2). The latter analogy exists only in the eastern dialect

534 (aratasu-aharu), and the connection remains suspect, the Nambikwara
789 not disdaining puns. (1) The same thing goes for the flutes of Pan,
[192]
[522]

1. For example, A1 mocks me when I am in the process of smoking: Kukedetu ukedetu: a smoker is lazy.

sometimes called du'uru (a1/2) du'unde (b1) which would also be the name of the animal agouti (Dasyproctas aguti). It is no less true that
[533] several of the songs collected have been pointed out as songs of the hunt or of the harvest. A soldier of the Rondon Commission, prisoner of the Nambikwara for quite a long time, described to Roquette Pinto (2) a ceremony composed of dances and songs which had

2. Loc. cit., p. 234-235.

followed a tapir hunt. And a musical theme was pointed out to us spontaneously as the song of the tapir hunt.

FROM BIRTH TO DEATH

844 The Nambikwara woman gives birth (to be born: talittige, b1) in a crouching position and getting support on the ground by means of a vertical pole which she holds with both hands. During this time a companion pours cold water over the chest and stomach with a small gourd. The umbilical cord is cut close and cauterized with a live coal, then covered with a salve of warm ashes.

47. dosu saikedutu'akedatelusu alosu usi'nkedjutu inketu iakesaitutu ire ire iagekediutu (a1)
[When] the woman gives birth the placenta is buried in the bush; she is ill, she does not eat [for] a moon, a moon [and then] she eats again.

846 After the ceremony of burying the placenta, consequently, the woman would remain for two months under a taboo and condemned to relative abstinence. In reality, an exceptional situation is prolonged much longer, the period of abstinence observed by the husband and wife until the child is weaned, or at least until he ceases to be exclusively nourished by the mother's milk.

To describe the state of abstinence (inkatu, "one is ill" [a1]; there is no special term), we can do no more than to transcribe our observations made from day to day relative to the family of fire 6 composed of A21, a22, and a23. a22 is clearly distinguished from her companions:

193 their suffixes in Ŝibṣa: —nak (Bribri), "excretion, secretion, resin"
197 and -dio, -rio (Bribri), "secretion, damp." (3)
811

3. There would be, naturally, a large number of detailed observations to present. In the different languages, the logical categories partially overlap; thus, the Nambikwara category -kere corresponds partially to the Bribri -kal, and at the same time to -Xkuo. The suffix -kere expresses resistance largely, and the suffix -kate, which we have connected with it, form.

The phonetic analogies which occasionally appear between the classifying suffixes of the Nambikwara and the Ŝibṣa do not seem to us of great importance. On the other hand, morphological analogy, and above all the division of things and beings into classes which are not imposed on the mind [114] by any internal necessity, do not seem to us to be logically the result of a pure phenomenon of convergence. We see there, on the contrary, sufficient reason to affirm a linguistic affinity between the Ŝibṣa and Nambikwara groups. (1)

1. In his book Durch Central-Brasilien, Von den Steinen had already suggested the constitution of a linguistic area extending from Colombia to northern Bolivia by a chart of the northern and western distribution of the word sisi (sun, fire). The term sisi can be approximated in Nambikwara: siisu (a1), siise (b1): round hut, circle.

[115] THE NUMBERS

802 The Nambikwara have only three names for numbers, strictly speaking: one, two and many. But they are capable of composing these terms to form higher numbers by addition. We have thus been able to obtain countings up to 5, 6 and 8. To count "one" the Indians hold down with the left hand all the fingers of the right hand except the thumb. To count "two," they hold down the thumb, ring finger, and little finger, leaving up only the index and the middle finger. To count "three," they hold down all fingers except the ring finger. As a matter of fact, as no special word exists for this figure, "three" is no more than a unit added to two. In the central and southern dialect

THE COLORS

822 The differentiation of colors has been studied in eleven patterns for which we give the list of Indian terms below.

Groups a and b present common characteristics. They distinguish white, black, red, blue, and put yellow and green in a single category. (1) However, while group a extends that assimilation

[193 197 171]

1. The term which designates green and yellow affects the singular form of a reduplicative plural. This morphological aspect is found again in Ŝibŝa: Thus in Bribri, green = tspa-tspa, yellow = kŏlo-kŏlo; in Guatuso, yellow = mari-mari; in Rama, yellow = nugnugna, green blue = nrinnrinma. (Cf. Lehmann, loc. cit., I, p. 333, 394, 434, 435).

to yellow ocher, group b stops at clear yellow and classes yellow ocher with burnt sienna in the same category, designated by the term of dialect a1 for "black." (2) Group c distributes the colors in a very

[826]

2. In accord with the anthropological judgment of the Indians who do not distinguish themselves from the "whites" as "yellow," but as the "colored" from the "clear":

(56) uãĩ ʔaniena tãĩkedniena (b1)
You are fair (clear), I am dark.

different way: one same category unites the reds and the yellows (which furthermore suggests the scale of the tincture of urucu), while the blues are attached to green and black.

The most esteemed colors are white and black, undoubtedly because these are the colors of the ornaments made from pearly fragments of river shells and from the dark nuts of the palm tree. Then comes red, then yellow. Green and blue are not much liked. [117]

822 192

Colors	Dialect a 1	Dialect a 2	Dialect b 1/2	Dialect c
White	ahẽndesu	ahẽndesu	dẽ ẽnde	pãte
Black	ŝundne	atũũdisu	uãte, dẽdẽne	tapũte

KNOWLEDGE RELATIVE TO THE UNIVERSE

821 The Nambikwara of the eastern group call the stars ikitasu, atasu (supernatural animal) or inintu atasu; those of the central and southern group call them tãgare (classifying: -gare, that which hangs, decorates, trembles) and distinguish between "little stars," (tãganiui'kare, -niui'kare being a diminutive) and "planets" (tãgarare; classificatory: -are, full, swelled, liquid). No information could be gathered concerning the constellations. The sun is [118] called otiani'kisu, uteri'tisu (a 1/2), ũnde (b 1/2), iõta (c); the moon i'ru, irɛkisu (a 1/2), hɛ̃nde, hɛ̃ɪnde (b 1/2), hi'ta (c), and they distinguish:

The full moon: arãditatinoa (a1), ɛiɛdãmniene (b1) ipãikolota (c);

The moon in its (first or last) quarter: ãgiai'inoa (a1), ɛuemirakende (b1), ipãikolo (c).

805 The year is divided into two periods: the rains (mihi'rage, b1), lasting approximately five months, and the dry season (kõmirige,

superior existem tres orificios. E' uma flauta mui semelhante ao "Xan-harí" dos Parecí, tocada pelo sopro do nariz.

Em Novembro 1910, no Jurueña, não longe de um posto telegrafico, puderam ser olhidas as seguintes palavras da lingua dos Nhambiquára:

Portuguese.	English.	Nhambiquára.	Portuguese.	English.	Nhambiquára.
Flecha	Arrow	Arukirapisú.	Cabelo	Hair	Anikisú.
Olho	Eye	Aisú.	Dedo	Finger	Taitasú.
Braço	Arm	Tanukisú.	Arco	Bow	Arankisú.
Dente	Tooth	Ani.	Vem cá	Come here	Nhangan.

Esse pequeno vocabulario difere um pouco do que vai adiante transcrito, o qual foi obtido em um posto avançado da Expedição, estabelecido na Serra do Norte, em 20 de Julho de 1909:

Portuguese.	English.	Nhambiquára.	Portuguese.	English.	Nhambiquára.
Agua	Water	Arí.	Taquará	Bamboo	Uanosú.
Abobora	Gourd	Ahitum.	Urucú	—	Nukirú.
Arara	Arara	An-nanzí.	Assucar	Sugar	Nakú-nosú.
Abacaxi	—	Koáre.	Agulha	Needle	Tatoá-nesú.
Amigo	Friend	Tiranhô.	Barro	Clay	Inosú.
Arroz	Rice	Isi-hinsú.	Burro	Mule	Anunasú.
Algodão	Cutton	Konguisú.	Boca	Mouth	Toái-iuçú.
Batata	—	Uinsú.	Cão	Dog	Inanzí.
Beijú	—	Urinosú.	Chapeu	Hat	Uinarí.
Cigarro	Cigarette	Jxi.	Camiza	Shirt	Uare.
Carne	Meat	Uicingú.	Panela	Stove	Sotrá.
Cabaça	Pumpkin	Uruxí.	Cerca	Enclosure	Kukuxí.
Calças	Trousers	Xranasú.	Cigarra	Cicada	Kikisú.
Caminho	Road	Aukuí.	Cajú	—	Irikisú.
Cuia	—	Katasí.	Cabelo	Hair	Uainikesú.
Collar	Neckchain	Airinkisú.	Dente	Tooth	Oicú.
Chocalho	Rattle	Nan-nisú.	Enxada	Hoe	Euasú.
Corrego	Stream	Un-ranasú.	Faca	Knife	Nuketiré-aha narú.
Enfeite para a cabeça	Headdress	Notum.			
Espingarda	Gun	Kukinasú.	Feijão	Beans	Koakisú.
Farinha	Flour	Orikesosú.	Tabaco	Tobacco	Esanasú.
Foice	Sickle	Eranzí.	Cesta	Basket	Atiri.
Gafanhoto	Grasshopper	Nakisú.	Machado de pedra	Stone Axe	Esú.
Machado	Axe	Uanharú.	Mandioca	Mandioc	Inasú.
Milho	Maize	Guisaquisú.	Mulher	Woman, wife	Akiaksú.
Melancia	Water melon	Bixú.	Nariz	Nose	Aiusisú.
Mão	Hand	Tosikisú.	Olhos	Eyes	Osiosú.
Orelha	Ear	Oasasinsú.	Cavilha para o nariz	Nose ornament	Usitesú.
Ovo	Egg	Nukúkrakarú.			
Cavilha do labio superior	Wood ornament for upper lip	Isosú.	Bastão ignijuso	Firewood	Aitisú.
			Pena de ave	Bird's feathers	Asasirí.
Pilão	A mortar	Nuxí.	Seringueira	Rubber tree	Uritisú.
Palha	Straw	Erenandú.	Tucum	—	Jaracú.

Nota: As palavras indijenas foram escritas de acordo com a fonetica portugueza. H deve ser aspirado. S-Z-X-U, como em Portuguez. K sempre brando.

[Two slightly differing vocabularies, the first recorded in 1910, the second in 1909. Phonetics as in Portuguese. "H" should be aspirated, "K" always soft.—Anal 1954]

/215 cont./

278 threatens to overflow it is removed from the fire for a second and then put back to boil. A thick, reddish scum forms which [414] holds the largest impurities; it is removed as it appears with a straw from a palm tree (Pl. V, A). After five to ten minutes on an average the boiling diminishes; the liquid turns brown and begins to thicken. It is then taken from the fire and [415] poured with the aid of a funnel (kõli) made from a rolled leaf into a new receptacle to be concentrated (Pl. IV, C).

[415] [177] Concentration. The concentration is done in a receptacle (here, a tin can from the mission) suspended 40 or 50 centimeters above a small fire, into which successive portions of liquid are added as they are prepared. The concentration takes two to three hours. According to its degree /of concentration/ they obtain a thick blackish-brown liquid, reddish when looked through, ready to be applied to the arrows with a straw, or a black paste which becomes very hard on cooling and can be kept for a long time. Before being used this paste must be softened at low heat.

The Çabanè recommend that one not touch the curare with the fingers nor even breathe the steam from it during the boiling. This hypothetical toxicity of the steam had already been noted by former travelers; it was even asserted that these emanations were so dangerous that the Indians had the curare prepared by old women who almost always succumbed to it. One can see (Pl. V, A) that the Çabanè sorcerer is not afraid of it.

Curare does not enter healthy skin, and the Ñambikwara of the Juruena press the water-soaked bark between their hands, taking the sole precaution of washing immediately afterward. The steam that I voluntarily inhaled never caused me the least sickness.

[412] The Çabanè call curare and the plant which produces it iríwa, and the still unconcentrated liquid from soaking iriwiya. The Tagnani name the plant and the curare naĩdé.

/215 cont./

278 Curare of the Ñambikwara of the Rio Juruena

The technique of the Ñambikwara of the right bank of the Rio Juruena is more primitive.

They use only bark which has just been gathered. The draining off of the bark is done only once and with warm water: the bark /216/ is put on the fire in a rather large amount of cold water, and the operation is ended when the temperature reaches 37° to 40° /centigrade/. It is filtered quickly by squeezing the bark with the hands to extract all the liquid from it. Then comes rapid boiling over a high fire and skimming. After several minutes of a rolling boil the fire is lowered and the liquid kept at a temperature a little below boiling until it has a pasty consistency.

[415 237] The curare is kept in paste form in bamboo tubes or changed into a very hard mass by the addition of meliponine beeswax.

This method exposes the curare to strong heat for at least two hours. The Çabanè method reduces this time to ten minutes, the other operations being carried out at low heat. Both produce curares with about the same activity.

[192 411] The Rio Juruena Ñambikwara call curare and the plant a'utĩsú or a'ukisú; the roots ta'ãdisú; the poisoned arrow aurú kiritkatsú, and its protective bamboo sheath asirikatsú.

Utilization of Curare

278 411 The Ñambikwara are not familiar with the blowgun. They use curare to poison large arrows with long, notched points, capped with a protective bamboo sheath. The points of the Tamandé curare arrows are shorter and more slender than those of the other Ñambikwara. They are usually placed in twos, threes, and fours under a single protective sheath.

According to the Indians an arrow's activeness does not last more than three or four months. The curare in paste form is kept for a longer time (close to a year). Hard curare can be kept for years.

423 garden, with the stipulation, of [113] a psychological and moral order, that one wait to take possession until "the memory of the dead
[428 425] has been lost." However, this semijudicial means of acquiring land does not imply the existence of an inheritance right. The relatives are not favored, and anybody can avail oneself of the same title.

GENERAL PSYCHOLOGY AND DAILY LIFE

The Categories

128 The linguistic study of the Nambikwara should be the object of special publications, (1) and we shall thus content ourselves

> 1. C. Lévi-Strauss, Sur certaines similarités, etc., loc. cit.; Paul L. Garvin, Esquisse du Système, etc., loc. cit.

here with several summary pieces of information destined to bring into sharper focus what can be inferred concerning the broad logical categories of thought, and to assign a place to the Nambikwara group within the orbit of other American cultures.

193 The most remarkable trait of the Nambikwara language,
197 made particularly evident by the central and southern dialect (b1),
811 is an extended use of the classificatory suffixes. The systematic character of the classification of things and beings is comparable only to that found in the Ŝibŝa linguistic family. Furthermore, if one ignores several secondary differences, the division of the world into categories in Nambikwara presents a remarkable similarity with that found in the Ŝibŝa dialects. (2)

> 2. The following examples are borrowed from Walter Lehmann, Zentral-Amerika, 2 vols., Berlin, 1920, I, pp. 277-279, 404, 440, 454, 571.

In the division of things and beings into eleven principal logical categories, ten are found to be common to the Nambikwara and to the Ŝibŝa. The category "season, weather, sky" seems to be broken up, in Nambikwara, into several suffixes. Inversely, the same suffix-are classes two categories logically related but distinguished by

193 their suffixes in Ŝibŝa: —nak (Bribri), "excretion, secretion, resin"
197 and -dio, -rio (Bribri), "secretion, damp." (3)
811

3. There would be, naturally, a large number of detailed observations to present. In the different languages, the logical categories partially overlap; thus, the Nambikwara category -kere corresponds partially to the Bribri -kal, and at the same time to -Xkuo. The suffix -kere expresses resistance largely, and the suffix -kate, which we have connected with it, form.

The phonetic analogies which occasionally appear between the classifying suffixes of the Nambikwara and the Ŝibŝa do not seem to us of great importance. On the other hand, morphological analogy, and above all the division of things and beings into classes which are not imposed on the mind [114] by any internal necessity, do not seem to us to be logically the result of a pure phenomenon of convergence. We see there, on the contrary, sufficient reason to affirm a linguistic affinity between the Ŝibŝa and Nambikwara groups. (1)

1. In his book Durch Central-Brasilien, Von den Steinen had already suggested the constitution of a linguistic area extending from Colombia to northern Bolivia by a chart of the northern and western distribution of the word sisi (sun, fire). The term sisi can be approximated in Nambikwara: siisu (a1), siise (b1): round hut, circle.

[115] THE NUMBERS

802 The Nambikwara have only three names for numbers, strictly speaking: one, two and many. But they are capable of composing these terms to form higher numbers by addition. We have thus been able to obtain countings up to 5, 6 and 8. To count "one" the Indians hold down with the left hand all the fingers of the right hand except the thumb. To count "two," they hold down the thumb, ring finger, and little finger, leaving up only the index and the middle finger. To count "three," they hold down all fingers except the ring finger. As a matter of fact, as no special word exists for this figure, "three" is no more than a unit added to two. In the central and southern dialect

THE COLORS

822 The differentiation of colors has been studied in eleven patterns for which we give the list of Indian terms below.

Groups a and b present common characteristics. They distinguish white, black, red, blue, and put yellow and green in a single category. (1) However, while group a extends that assimilation to yellow ocher, group b stops at clear yellow and classes yellow ocher with burnt sienna in the same category, designated by the term of dialect a1 for "black." (2) Group c distributes the colors in a very different way: one same category unites the reds and the yellows (which furthermore suggests the scale of the tincture of urucu), while the blues are attached to green and black.

[193 197 171]

1. The term which designates green and yellow affects the singular form of a reduplicative plural. This morphological aspect is found again in Śibśa: Thus in Bribri, green = tspa-tspa, yellow = kŏlo-kŏlo; in Guatuso, yellow = mari-mari; in Rama, yellow = nugnugna, green blue = nrinnrinma. (Cf. Lehmann, loc. cit., I, p. 333, 394, 434, 435).

[826]

2. In accord with the anthropological judgment of the Indians who do not distinguish themselves from the "whites" as "yellow," but as the "colored" from the "clear":

(56) uśi ʔaniena taĵkedniena (b1)
You are fair (clear), I am dark.

The most esteemed colors are white and black, undoubtedly because these are the colors of the ornaments made from pearly fragments of river shells and from the dark nuts of the palm tree. Then comes red, then yellow. Green and blue are not much liked. [117]

SP17 Nambicuara SP17

Nambicuara (Roquette-Pinto's *Uaintaçu,* which includes his *Kabishi, Tagnani, Tauitê, Tarutê,* and *Tashuitê*) between the Guaporé River Basin in the south and the Tenente Marqués, Iké and Roosevelt Rivers in the north and northwest; *Western Nambicuara* (new), closely related to the central and southern groups and living on the headwaters and in the upper basin of the Roosevelt River; and *Northern Nambicuara* (new), speaking its own language and living north of the central group.

The Indians mention other tribes north of the *Nambicuara;* one called *Saluma, Saruma,* or *Solondé* is almost certainly the *Mundurucú;* another may be the *Tapanyuma.*

In 1907, Rondón estimated the total *Nambicuara* population to be 20,000. In 1912 Roquette-Pinto met 1,000 to 1,500. It is doubtful whether the total population, which has been decimated by several recent epidemics, now greatly exceeds 1,500.

The *Nambicuara* language was previously thought to be isolated, but its distinctive trait—the use of classificatory suffixes dividing the universe into about ten categories—is strongly reminiscent of *Chibcha.*

Nambicuara culture, although less primitive than that of the *Sirionó* to the southwest, is strikingly simple in comparison with that of the neighboring *Paressí* to the southeast and of the *Tupí-Cawahíb* to the northwest. Their lack of the hammock, their custom of sleeping on the ground, their crude ceramics (the *Eastern Nambicuara* entirely lack pottery), the nakedness of both sexes, their nomadism, their use of temporary shelters during most of the year, the general poverty of their material culture, and the simplicity of their social organization distinguish them from the higher cultures of the Guaporé River area, to which they nevertheless probably belong.

CULTURE

SUBSISTENCE

The *Nambicuara* habitat is a savannalike plateau about 500 to 1,500 feet (150 to 500 m.) above sea level with an arenaceous soil which comes from disintegrated sandstone bedrock. Except for narrow gallery forests along river banks, the region is infertile, having only shrubs and small trees with thorns or thick bark.

In this unproductive environment the *Nambicuara* have a dual subsistence pattern. They are both seminomadic bush dwellers and incipient farmers. During the dry season, women, accompanied by their children, forage with digging sticks for wild fruits, seeds, and roots, and catch grubs, rats, bats, spiders, snakes, lizards, and other small creatures, while men hunt what large game they can find with bows and arrows and collect wild honey.

194 The consonants are b, c, d, g, h, k, l, m, n, r, s, t, z; h is always strongly aspirated, like German ch.

F, j, v, and x are lacking.

The following consonant clusters are characteristic: an, kr, tch, dn, gn, tg, tn, kd, kz, kt, nt, nz, tz, td, nç, tç, tzũ, gç, gd, ndz, nk.

193 Those words designating parts of the human body have the same root in all Nambicuara dialects, slightly modified in one case or another: uá or toá.

[263]

	Cocozu	Tagnani	Tawite	Anunze
Arm	Oá-nukicú	Uá-nokrí	Toá-rabatndê	Uá-nukizê
Mouth	Toá-iuçú	Uá-iurí	Tá-iuirí	Uá-iuarê
Tongue	Toáio-herú	Uái-hêndê	Táiu-hendú	Uáile-herú

Here the particle toa (uá, oá) has the same possessive value as the nu particle of Arawakan languages; it is found only in words pertaining to parts of the human body. (1)

[113]

1. See E. Roquette-Pinto, "The Indians of Serra do Norte," [Engl.] Proceedings of the Second Pan-American Scientific Congress (Washington, 1917).

[Fig. 50]

Nearly all Cocozu words end in zu or çu, used interchangeably. Anunze words often end in zé. But this last sound, to be pronounced properly, must be approximated to gé. (2) In the Tawite dialect and

2. This may be a linguistic trait of Ge parentage. (H. A. T.)

/are common.

in the several Tagnani dialects, endings in di, tê, rê, and ri (soft r)

197 One particle found rather frequently in these dialects deserves
193 special mention, owing to its importance for the [264] evaluation of

194 relationships with other American languages. This is the gui or gue
193 particle:

Kaiguetazú -- flute (Cocozu)
Hauguidê -- smooth arrow (Tagnani)
Toáiguedokrê -- hand (Tawite)
Uáneguêtu -- head (Anunze)

124 Although various phonetic systems are in existence for the transcription of primitive languages (Kosmos Alphabet, Schmidt's Alphabet, etc.) (1), I deemed it preferable to use the letters of the

1. Fa. W. Schmidt (Anthropos, 1907) describes in detail the historical evolution of phonetics and the various systems which have been suggested. In the same paper he presents his own method, which has been granted wide acceptance.

Latin alphabet in conjunction with a few special signs such as the umlaut, which are within the grasp of any reader.

[Fig. 51]

194 If Martius' linguistic scheme were still accepted, the Nambi-
197 cuara tongue would be included among the languages of the "Guck" or "Koko" group. This family, however, was not maintained in view of its great diversity; and now its former members are [considered] to belong to the Ge-Botocudo and Nu-Arawakan groups.

The languages of the Nu-Arawakan family, however, own certain significant characteristics which are not encountered among the dialects of the Serra do Norte.

For instance, the personal possessive particle nu, one of the most valuable traits in the identification of these languages, is never found among the Nambicuara.

[265] The word used to designate water, one of the best elements for purposes of linguistic comparison because of its constancy throughout the Nu-Arawakan dialects in spite of other differences (onê, uní), has no equivalent in the Serra do Norte.

7:Roquette-Pinto--48 E-4, 5 (no date)1938 SP17 Nambicuara SP17 (ca. 1912)

115 We managed to obtain four different word lists: Cocozu,
124 Anunze, Tagnani and Tawite. The two lengthier ones--Anunze and Cocozu--were obtained with us much exactitude and certainty as possible (and, I believe, as much as necessary) thanks to Nuleke and Krikricêknerá. These two Indians had been devoted friends of Lt. [Plates p. 261.] Pyrineus de Souza since the days when he had managed the post at Campos Novos.

[Fig. 48]

Nuleke is so fond of Lt. Pyrineus that when we returned in 1912 he did not hesitate to cross the borders of his territory, leaving the land none of his people had abandoned in centuries, to follow the muleteers to Tapirapuã in search of his friend.

He was the first to place himself trustfully into Brazilian hands.

These two Indians lived at Campos Novos like adopted children of the household. At night they both slept under Pyrineus' hammock. They already spoke a few words of our language.

[Fig. 49]

The Indian Damasceno (Urinenoá), already mentioned above, was of great help with the Cocozu language. He was the most intelligent boy we could find. One Tagnani shared this honor, and we were sorry to part with him. He understood the slightest gesture, and carried out to perfection our every request. It was he who consented to simulate an arrow attack which I asked for by means of signs and which is now recorded on a film belonging to the [National] Museum and shown at the National Library in 1913.

[262] Each word on the lists was verified more than once in the presence of the object or phenomenon it describes.

We were more interested in the quality than in the quantity of words.

This does not mean that we believe no corrections are possible; it is sufficient to compare two lexicons compiled by capable persons among the same Indians, on separate occasions, to see how differently certain terms may be rendered.

● 194 The Nambicuara language contains the following vowels: a, ê, i, ô, o, u, ü, with the same values as they would have in Portuguese; the sound of ü is intermediate between German ü and French eu.

194 The consonants are b, c, d, g, h, k, l, m, n, r, s, t, z; h is always strongly aspirated, like German ch.

F, j, v, and x are lacking.

The following consonant clusters are characteristic: an, kr, tch, dn, gn, tg, tn, kd, kz, kt, nt, nz, tz, td, nç, tç, tzn, gç, gd, ndz, nk.

193 Those words designating parts of the human body have the same root in all Nambicuara dialects, slightly modified in one case or another: uá or toá.

[263]

	Cocozu	Tagnani	Tawite	Anunze
Arm	Oá-nukicú	Uá-nokrí	Toá-rabatndê	Uá-nukizê
Mouth	Toá-iuçú	Uá-iurí	Tá-iuirí	Uá-iuarê
Tongue	Toáio-herú	Uái-hêndê	Táiu-hendú	Uáile-herú

Here the particle toa (uá, oá) has the same possessive value as the nu particle of Arawakan languages; it is found only in words pertaining to parts of the human body. (1)

[113]

1. See E. Roquette-Pinto, "The Indians of Serra do Norte," [Engl.] Proceedings of the Second Pan-American Scientific Congress (Washington, 1917).

[Fig. 50]

Nearly all Cocozu words end in zu or çu, used interchangeably. Anunze words often end in zé. But this last sound, to be pronounced properly, must be approximated to gé. (2) In the Tawite dialect and

1. Fa. W. Schmidt (Anthropos, 1907) describes in detail the historical evolution of phonetics and the various systems which have been suggested. In the same paper he presents his own method, which has been granted wide acceptance.

Latin alphabet in conjunction with a few special signs such as the umlaut, which are within the grasp of any reader.

[Fig. 51]

194 If Martius' linguistic scheme were still accepted, the Nambi-
197 cuara tongue would be included among the languages of the "Guck" or "Koko" group. This family, however, was not maintained in view of its great diversity; and now its former members are [considered] to belong to the Ge-Botocudo and Nu-Arawakan groups.

The languages of the Nu-Arawakan family, however, own certain significant characteristics which are not encountered among the dialects of the Serra do Norte.

For instance, the personal possesive particle nu, one of the most valuable traits in the identification of these languages, is never found among the Nambicuara.

[265] The word used to designate water, one of the best elements for purposes of linguistic comparison because of its constancy throughout the Nu-Arawakan dialects in spite of other differences (onê, uní), has no equivalent in the Serra do Norte.

194
197 These traits alone would be sufficient to set the Nambicuara language apart from the Nu-Arawakan dialects.

But beyond this, it is easy to verify the dissimilarity between the lexicons [of these two groups]. Compare the Paresi vocabulary, an excellent representative of the Nu-Arawakan family, with the word lists of the Serra do Norte Indians. They are completely different.

We would search in vain through South America for a language possessing any deep affinities with the Nambicuara dialects.

[Fig. 52]

It is true, however, that the language of the Xingu River Suya bears a certain resemblance to the dialects of the Serra do Norte. The possessive particle wos of the Suya, which is clearly found among the Nambicuara in the form of either ua or toa, constitutes the best argument in favor of this relationship.

In view of this characteristic, therefore--and it is a significant one for it has served as a basis for the modern classification of our tribes--[266] wherever the Suya are placed the Nambicuara should also be included. (1)

[p3]

1. In "Beitrage zur Ethnographie des Araguaya-Xingú Gebietes [Contribution to the Ethnography of the Araguaia-Xingo District]," Proceedings of the XXI International Congress of Americanists (Göteborg, 1924), Fritz Krause confirmed this linguistic affinity and attempted to make it even closer by citing additional words akin not only to Caraja but also to Ge dialects.

As to cultural aspects, it becomes obvious, especially in view of Nordenskjöld's comparative ethnographic studies, that the Nambicuara as well as the Caraja have been influenced by sub-Andean cultures.

The Caraja show signs of being partially subjected to this influence at the time when

RR
197

it reached the Chaco region, where they would thus appear to have lived at an earlier time. (See Krause, op. cit.)

On the other hand, as already pointed out elsewhere, the Nambicuara seem to have received this cultural influx by way of a different route--probably through the other channel of sub-Andean cultural expansion described by Nordenskjöld, which ran from northeastern Bolivia down the Amazon and La Plata watersheds. (Nordenskjöld, op. cit., Vol. I).

(H. A. T.)

This is perhaps where the problem becomes most difficult: although Ehrenreich places the Xingo Indians alongside the Ge, other experts on South American linguistics believe, perhaps rightly, that they should be included with the Caraja in Chamberlain's "Carajan" group. (2)

2. Krickeberg, Rivet, and other experts still place the Suya among the Ge.

[Fig. 53]

Yet it is also inevitable to recognise in the Nambicuara language certain special characteristics of the Kirirí tongue. These traits are exclusively phonic, and [thus much less significant than if they were lexical or morphological.

[267] They merely consist of the ng, tz and kz sounds, which are accepted as peculiar to the Kirirí language (Baptista Caetano).

In the absence of well translated texts, it is impossible to delve more deeply into the study of these dialects. Even the relationships suggested above will be subject to revision when more complete linguistic materials become available.

467 As regards the [National] Museum collection, the following data are worthy of note.

where the town of Villa Bella de Mato Grosso, three quarters abandoned, must have undergone several attacks by unknown Indians, during the same period, but whom the rare residents also call by the name of Kabiji. According to our informants, this group in itself still had 700 or 800 individuals of whom we encountered a dozen in September 1938 (1). The other groups decreased rapidly, by epidemics, and

1. See below, p. 52.

owing to their feeble birth rate which constitutes a general phenomenon as will be seen in the chapter dedicated to the analysis of each group.

* * *

All by himself, Roquette Pinto has attempted a classification of the Nambikwara. He distinguishes four groups. To the southeast, the Kokozu, who live near the Juruena, Juina, Papagaio and Camarazt Rivers; to the northeast, the Anunsé, who occupy the basin of the Dore de Outubro River; to the southwest, a group called Uainazu or Kabixi, extending from Campos Novos to the valley of the Guaporé. Finally, to the northwest, from the west bank of the Dore de Outubro River to the valley of the Roosevelt River, is found a final group consisting of the Tagnani, Tauité, Saluma, Taruté, Taschuité. Roquette Pinto does not clearly indicate on what basis this classification is founded. One can assume that it is not purely linguistic, since the vocabularies published in Rondonia contain only three dialects. Without doubt, a good deal of empiricism is involved. Besides, the list of groups which is found in the publications of Rondon and his collaborators only occasionally corresponds to the classification of Roquette Pinto. Our own lists of names of groups do not include all those cited by our precursors; but they reveal several new names. At the same time, we have brought up some dialects which had never been mentioned. It is thus too early to proceed to a definitive classification, and farther on will be found the reasons for these uncertainties. The nomad bands of the Nambikwara are of fragile formation, and they all possess a name, a surname derived from the system of parentage or owed to the malice of a neighboring group. Thus the names appear, disappear, or are transmitted with surprising facility. Here is a good example of disagreement [8] between observers working in different periods: Somewhere, between 1926 and 1928, Max Schmidt collected a short vocabulary of 30 words, which he published later on (1) as having been obtained from a group called

1. loc. cit.

[10] Tamainde, then installed at Tres Buritis. This vocabulary certainly
[11] comes from group b2 of our classification, who are distinguished by
[12] the usage of a verbal suffix of the form -kare, and which we have also found in the region of Tres Buritis. However, in 1938, the users of this same dialect called themselves by the name Taisnê, and the name Tamainde was only used by a group speaking a different dialect (b3) to point out a third group (c of our classification), and one may doubt that its dialect even belongs to the Nambikwara linguistic family.

[21] What conclusions may be drawn? Any attempt at classification based on the names of bands, whether they be chosen by the band or received from neighboring groups is condemned to failure in advance. The only sound basis for a classification of bands and groups can be linguistic. In any case, this method will be the only valid one as long as study carried on during the rainy season will not permit the establishment of larger and more stable units than the nomadic bands of the dry season. As it would be difficult and arbitrary to call each
[28] dialect by the temporary name of such and such a band who spoke it at the moment when the research was being carried on, and as a classification undertaken on the basis of present knowledge could only be provisional, we shall proceed with the aid of symbols, in preference to the names of groups which would give a false picture of reality.

[47] This having been stated, it can be said that the Nambikwara linguistic family includes three principal groups of which two are subdivided into sub-groups. There are in all five distinct units. The two groups that we designate respectively by a and b are closely related from a semantic and morphological point of view, and they incontestably represent two modulations of the same language. In the two cases one observes the same usage of classifactory suffixes, with a verbal suffix whose meaning is "to be," "to become," "to do," to make." In the dialect of group a, this verbal suffix appears in the forms -kedjaru, -kedutsu -ki'titu. One should distinguish a type a1, predominant from the Papagaio to the Juina River, with an ending -u for nouns, and a type a2 which tends to substitute an ending -e for the preceding. As this last group is found to the west of the other, and it occupies approximately the region from the sources of the Dona de Onibeo River and the Camararé River, it appears likely that the ending -e has appeared under the influence of dialect b. Apart from the ending and several variations in vocabulary, the dialects a1 and a2 are practically identical.

The vocabularies of groups a and b diverge more seriously. The latter also presents an ending -e for nouns, and some [9] new forms for the verbal suffix. On that latter basis, one should distinguish a

MT sub-group b1 with the verbal suffix -dige or -dage, and a sub-group b2, in all points identical to the preceding except the verbal suffix of the form [10] -jare. The region of the dialect b1 extends from the right bank of the Guaporé in the south to the lower course of the Tenente Marques and Ité Rivers in the north, and from the basin of the Doze de Outubro River in the east, to a region terminating above the right bank of the Roosevelt River to the west. One hears dialect b2 from the upper basin and the middle basin of the Roosevelt River to the juncture of the Barão de Malgaço and Commemoração de Floriano Rivers.

In these semantic and morphological characters, dialect c departs clearly from the preceding. We have not progressed far enough in studying it linguistically to decide whether or not it is correct to include it in the Nambikwara family. It is spoken in a region situated to the north and northeast of the region of dialect a2.

We shall now attempt to establish a correlation between our classification and the previous outlines.

101
MT

1. Group a.

Sub-group a1.

From the vocabulary published by Roquette Pinto at the end of Rondonia, and from geographic indications which he furnished, one can conclude that his Kokoxu (which form his group in the southeast) certainly corresponds to our sub-group a 1. Nevertheless, we have not been able to find the term Kokoxu (P. de Souza: Cocoxu) again. The ending -u indicates dialect a 1; but the term koko belongs to the Parecí language and to the dialects of group c, with the same meaning "maternal uncle." It is completely unknown in the system of parentage of group a. According to our information, group a 1 would be called:

1. xaligere by group b 1;
2. xalixiri"re by group c;

and it is divided into numerous bands who call themselves, or who give these names to one another:

3. xakiróxoxo (right bank of the Juruena);
4. halagóxoxo (left bank of the Juina);
5. kiaxoxo (surname: "the liars"; upper-Juruena);
6. kuri"xoxo (left bank of the Juruena).

1/4 [Map No1 follows here. - Analyst]

1:Lévi-Strauss (1) E-5 (1938-1939) 1948 SP17 Nambicuara SP17

Map No. 1

Telegraph Line ----

101 Group a 1 is in contact with the Iranxe Indians, whom they call:
197 7. iraʼsu (at the juncture of the Clavary and do Sangue Rivers).

[11] Sub-group a2.

These are the Anunzu, Anunzé, or the southeast group of Roquette Pinto (P. de Souza: Anonzé). The brief vocabulary published by Roquette Pinto following his own vocabularies also belongs to this group. We have never found the term Anunzé nor the other forms, but only the names,

8. soʼlesu (a 1/2);
9. kahaʼtelí (b 1);
10. munʼheti (c).

II. Group b.

Sub-group b1.

Our sub-group b 1 includes the Uaintaçu, Uaindzé (Rondon: Uaindezi), Kabixi, Tagnani (Rondon: Tagnani), Tauité (Rondon: Tauité), Tarusé, Taschuité (Rondon: Tachivuité) of Roquette Pinto, that is his two groups, southwest and northwest. We have never found the term Tagnani, nor, as a name of a band, the terms tauitte, tarune, tasuitne, which signify respectively, in the system of parentage of group b, "my child," "my brother-in-law," "my relative to the third degree." The Paresi apply the name Kabixi to group b. For the term Uaintaçu, we have found an equivalent:

11. oʼindesu (a 1),

which designates group b. On the other hand, we have collected the following appellations:

12. nikedetsou (a 1; to the west of the Camararé River);
13. tarytide (b 1; basin of the Doze de Outubro River);
14. maimande (b 1; --Kabixi [Paresi] Mama-inde [Rondon]; sources of the Doze River and right bank of the Guaporé):(1)

1. It seems that the southern frontier of the maimande group is rather on the course of the tributaries of the right bank of the Guaporé River. The Guaporé strictly speaking is inhabited by river tribes, distinct from the Nambikwara in tongue and culture. But these tribes

101
197

know and fear the Indians called Kabiji, this as far away as the São Miguel River (Haseman, "Some notes on the Pawumwa Indians of South America," American Anthropologist, 1912, p. 333). To add to the obscurity which still covers the problem of the southern frontiers of the Nambikwara, the Paressi of the south, who live to the east of the sources of the Juruena, are also known by the name of Kabiji (Max Schmidt, "Reisen in Matto Grosso," Zeitschrift für Ethnologie, 1912, Vol. 44, pp. 146-176). Today they have intermingled or disappeared.

[12] 15. mamãindeti (c; identical to the preceding, and, by extension, to the whole group b 1);
16. itãmolo (c; toward the south).

Sub-group b 2.

This dialect had never been pointed out, except by the short vocabulary published by Max Schmidt and attributed to a Tamainde group. We have collected the following names:

17. tonãnde (b 1; left bank of the Barão de Malgaço River);
18. kõiola (c; same region);
19. nãselate (b 1; between the Tenente Marques and Roosevelt Rivers.
20. lakõnde (b 1; right bank of the Roosevelt River);
21. sovãnte (c; same region);
22. navãite (b2 [Rondon: Navaite]; Roosevelt River);
23. taiate (b2; Roosevelt River).

III. Group c.

This group seems not to have been studied. Only Rondon mentions, without geographic or dialectic information, a group Sabanê and a group Taia. This last term belongs to the system of parentage of group c with the meaning "elder brother (or sister)"; we have never found it as a name of a band. On the other hand, group c calls itself by the name:

24. sabãne (c),

and is called by other groups:

25. tamainde (a 1/2);
26. tamãnde (b 1/2).

IV. Names of Other Nambikwara Groups.

|01| For the terms Malutundu, Ualutnudu, Ua-lut-ndu (Roquette
|97| Pinto), Malotundu (Rondon), we have an equivalent:

27. malõnde (b 1),

which, nevertheless, has been given to us with the general sense of "Indian" (maõone, b 1[1] "it is an Indian") as opposed to "Brazilian" (kaiaõgere, b 1[1] "the dressed").

We have not been able to collect any equivalent for the following terms cited [13] by Roquette Pinto and Rondon to designate Nambikwara groups: Taiopa (Roquette Pinto), Teiobé (Rondon), Tayopa (P. de Souza) (1), Xaodikokas (Roquette Pinto), Xaodes (Rondon), Xaodys (P. de Souza), Nitné (Rondon), Minis (Rondon), Pavates (Relatorios de Commissão Rondon, passim). The authors mentioned do not furnish any precise information concerning the dialect and the geographic situation of these groups.

1. There is a term of parentage iõpa which belongs to dialect c with the sense of "brother-in-law," but the possessive i or ia comes from dialect b.

V. Names of Other Tribes

Roquette Pinto cites the term Saluma as belonging to his northwest group. We have documented it under the forms:

28. soiõnde (b 1);

29. soiõma (c);

to designate a northern tribe strange to the Nambikwara. As von den Steinen cites the name Sunuma, given, he says, by the Paresi to the Mundurukú, this interpretation seems more reasonable. Group c calls the Paresi,

30. Jamaõe iharaka (c)

and recognizes at least the existence of three other northern tribes,

31. ikatinaui (c);

32. kaiaõli (c);

33. jeraõolonte (c).

Sub-group b 1 at times mentions a tribe living around the Barão de Malgaço River,

34. jkaõõre (b 1).

601
184

14. tiimo..... husband, son of the father's sister, son of the mother's brother.
15. iopa..... sister's husband, wife's brother (m. s.).
16. iiuitta..... brother's wife, husband's sister (w. s.).
17. iiauitte..... daughter's husband, (f. p.), daughter's husband, "wife's" husband (m. s.).
18. iinaiio..... brother's daughter (w. s.), sister's daughter (m. s.), when she is at the same time wife of the son (m. w. s.) or wife of the younger brother (m. s.).
19. iiti..... daughter's children.
20. ioeio..... son's child, or of the daughter when the latter is married to an uncle.
21. zoa..... child (married to an uncle).

617 [32] This vocabulary of relationships apparently does not offer any affinity linguistically with that of dialects a and b; and the structure of the system also seems different. Without doubt the fundamental principle—the marriage of cross-cousins—remains the same. To be convinced of this, it is sufficient to refer to the list of relatives designated by the terms tiimo and iatta. Again one finds the division of members of the same generation into sisters and wives (m. s.), or brothers and husbands (w. s.) on one side, and on the other, sisters and wives of brothers (w. s.), or brothers and husbands of sisters (m. s.). But the distinction here is more confused, since it is accompanied by an absence of symmetry concerning the designation of the brothers and sisters of parents, and the children of the brothers and sisters of the subject. Instead of finding the first divided into fathers and mothers, fathers-in-law and mothers-in-law, and the second into children, and sons-in-law and daughters-in-law, we have a more complicated terminology. The name of the father's sister (asiataba) differs from that of the wife of the mother's brother (siiko), although they are habitually confused in a system of marriage among bilateral cross-cousins. There is also a special name for the father's brother. But, if this latter is a younger brother who has one of his nieces, he will be called brother-in-law (iopa) by his brother's son, his nephew. Even more delicate is the naming of nephews and nieces because the symmetry carried on by the other systems between the children of brother (of a brother) and the children of sister (of a sister) fades out giving way to a new symmetry, this time between the children of sister (of a sister), and the children of the wife (classificatory) of the brother, who are called by the same name. Moreover, the children

621 We shall comment later (1) on the complex motives that might have induced

1. Cf. p. 77.

[197] these two bands, speaking different dialects and who were not even capable of understanding one another without an interpreter, to practically merge. It seems that group b1 was composed of the rare survivors of a formerly important formation now disappeared, living previously in two distinct groups, around the sources of the eastern tributaries of the Roosevelt River. We have already tried to calculate these losses, resulting from recent epidemics (2). Group c had,

2. Cf. above, p. 6.

without doubt, gone through the same hardships. Moreover, its [578] position had been compromised by antagonisms with other bands rising from the same dialect, and who had formerly been their allies. A visit, with a commercial goal, of related Indians originally from the south (members of the group known by the name of Kabisi) must have raised the forces of group b1 to 31 persons for 621 several days. Here is its composition at this moment:

115 157 622 601 Fire 1 (1 to 7). --The family of the chief of the band. The chief, B1, is 30 to 35 years old, and one of the most intelligent Indians whom it was our privilege to encounter. But he is intelligent in a way very different from A1. The latter is prudent and very resourceful, always meditating some political combination. On the contrary, B1 is not a man of action, but rather contemplative, with a charming and poetic spirit, and rich sensibilities. He is fully conscious of the inevitable decadence of his people, and this conviction often shades his words with a subtle tint of melancholy:

(4) ĺoãmditnʔẽ . nĩãnaĩne hẽni niho ãmdednĩẽn. (b1)

"I also did the same thing, now it is finished," [51] he says, remembering happier days when his group, far from being reduced to a handful of individuals incapable of keeping alive their traditional customs, was comprised of several hundreds of participants faithful to all the manifestations of the Nambikwara culture. His curiosity toward our customs and towards those which we had been able to observe in other tribes is just as great as ours. With him, ethnographic work is never unilateral. He conceives of it only as an exchange of information, and what we bring him is always very welcome. Often [17] he even asks us for--and preserves carefully--drawings representing

621 [53] Western group, dialect b2: tajate, takõnde (b1/2); 601 soyaĩnte (c).

We shall limit ourselves to giving the genealogical scheme of the composition of this little group (Figure 16), found, only for several days, toward the line of the division of the waters which separate the basins of the Roosevelt and the Gi-Parana (Tres Buritis). Its members seem to be the survivors of a formerly important group, the tajte.

Northern group, dialect c: sabãne (c); tamãnde (b1/2); tõtesu (a 1/2).

●[54] We have not been able to establish the genealogical composition of this group for reasons of linquistic difficulties (dialect c does not seem to spring from the same family as the others) and because of the consecutive impossibilities which we encountered in determining the true position in the system of individuals designated by the same term. We shall thus content ourselves with an analysis by households.

Fire 1 (1 to 3). --C1, about 30 years, and his wife c2, 25 years; he, "brother" of C6, she, "daughter" of c23; their son, C3, is about 10 years old.

Fire 2 (4 and 5). --C4, 40 years, is the younger brother of C20 and of c23; his wife c5, 25 to 30 years, is called "wife" by C6, "older sister" by c21, and "daughter" by c23.

Fire 3 (6 to 10). --We have already analyzed (1) the kinship

1. Pp. 33 to 35.

situation of C6, of his wife c7 (both are 30), and of their children c8 and c9 (6 to 8 years); the younger brother of the wife, C10, about 10 years, lives with them.

Fire 4 (11 to 14). --C11 is 50 odd years old; he is called "elder brother" by C6, C4, C15, C20, and c23; his wife c12, about 35 years, is "daughter" of c23; the young brother of the latter, C14, about 17 years, unmarried, lives with them as well as their daughter of 7 years, c13.

Fire 5 (15 to 18). --C15, about 30 years, is called "younger brother" by C20 and c23; his wife c16 is "daughter" of c23; she has a young brother C17, about 12 years, and a baby of some 20 months, c18.

841 147 171 among South-American Indians. Since the sixteenth century, travelers have often been amazed by the insignificance of the menses of Indian women. Thus: "In the period of about one year which we spent in that country, ordinarily associating with the people, we have never seen the women have their menses" (J. de Léry, Voyage faict en la Terre du Brésil, Gaffarel, Paris, 1880, Vol. II, Ch. 17, p. 92); and more recently: "no one notes when they go through certain difficult periods peculiar to their sex" (Tocantins, "Estudos sobre os Mundurucus," Revista do Instituto Historico e Geographico Brasileiro, Vol. 40, 1877, p. 113). On the other hand, the text just cited could be interpreted in two different ways: the vocal inflexion of the informant suggested that the expression edẽdé edẽdé edẽdé signified "(this) moon (yes), (this) moon (no), (and this) moon (again)", meaning "every other moon" and not—as it is also grammatically possible—"moon, moon, moon," that is "every moon." The first sense would constitute a sort of physiological scandal, but remains, nevertheless the most probable. In fact, it is possible that the periodic indispositions are less important and more irregular among South-American women than is the case among the whites.

842 [209] The Nambikwara have a very clear idea of the relationship between sexual intercourse and conception. It is frequent that an Indian clarifies that paternity relationship is one of the blood, and not classificatory, by forming a ring with the thumb and index finger of the left hand, into which he introduces the index finger of the right hand which he glides back and forth. After this demonstration, he indicates the child saying: tayétte, tayétte, "my child, my child" (3).

3. From the same observation made by Roquette Pinto (loc. cit. p. 255) more than twenty years earlier, one can conclude that this gesture does not constitute an individual innovation, but a stylized social conduct.

842 833 197 Etymology points out the connection between the two phenomena: in the eastern dialect, "copulate" is translated nitnedjutu and, in the central and southern dialects, tamindige, tuutare. These three terms are attached to the respective forms [64] for "father": ahutnosu (nosu = man, al), tamindé, uáfre. On the other hand, in the northern

842 dialect, it is: "to copulate," iruja, juũreli, while "father" is uũinko;
833 but one refers rather to sexual relations by the term ʒikiʃikiʃi, whose
●197 evocative value is reinforced by an appropriate gesticulation. This term corresponds, in the other dialects, to the compounds uinikuʒiʒu (a1), iekejakãtige (b1), "to copulate with rhythmic movements." Likewise, in the western dialect, "to copulate" is expressed by ainʒore, even though the demonstration evoked at the beginning of this paragraph uses the term ninʃore.

842 We have not been able to elucidate clearly the indigenous theory of conception (conceive: uetnẽdige, b1; from uette, "child"). It implies apparently that the sperm coagulates in the uterus and progressively forms the child. The man alone would play a positive role while the woman would be reduced to that of a simple receptacle. Nevertheless, the woman is held responsible for sterility, whether it be attributed to a particular condition or to age.

834 It is difficult to say if the numerous prohibitions attached to
842 sexual relations have as a conscious end to assure conditions favorable to reproduction, or if they depend on more remote beliefs. The first hypothesis is hardly credible, for the Nambikwara are not very eager to have children. The quest for food is too hard, too difficult, to permit the care of several children at the same time, especially when they are still incapable of taking care of themselves; and especially, during the nomadic period a woman cannot carry more than one nursing child, besides the heavy basket. Thus the first steps of the child are impatiently awaited. At any rate, several prohibitions have, as a definite goal, the limitation of sexual activity. Besides the prohibition of incest (1), it is not good to copulate "moonlit

835 1. The prohibition concerning incest is formulated as follows:

(7) tyãde takenãde tamĩndige manhatte (b1)
for a sister and brother to copulate is bad

[284] but it does not seem that the infractions are punished other than by collective disapproval. A very equivocal attitude concerning a couple (A71 and a72) and the use, in their regard, of kinship terms communicated with repugnance, and manifestly contradictory to the system, makes one believe that it could be a case of parallel cousins. We have not been able to find a sure case of incest between blood relatives.

In fact, if there is
621 no doubt concerning the close affinity of dialects a1, a2, b1 and b2,
197 which do not differ among themselves except as the derivations
182 of a mother language, dialect c offers, as regards the preceding,
184 such profound differences that one does not know if one is in the presence of a language of the same family. In any case, in whatever way linguistic study might resolve this problem, it can be reasonably set forth. We do not hesitate, nevertheless (and in spite of anthropological differences), to place group c in the cultural family of the Nambikwara, because of the identity of material culture and way of life, and especially because of the psychological attitude of groups b1, b2 and c as regards one another, who ostensibly recognize their community.

621 The union of the two groups posed a problem, that of the
605 nature of the relationships which would go on between their respective members. This problem [78] has been resolved by the recognition of all male members of group c as being "cross-cousins"—tarûte, of all the adult males of group b1, and of all the adult males of group b1 as being the jôpa (corresponding to "cross-cousin" in the vocabulary of parentage of group c) of all the adult males of group c. The result, consequently, is that if all the husbands of the two groups are "brothers-in-law among themselves," all the "wives" of a group are "sisters" of the husbands of the other, and all the children of both sexes, in a group, potential husbands or wives of the infants of the other group belonging to the opposite sex. The blood fusion of the two groups is thus definitely assured for the following generation. Here is a type situation which one finds thus realized:

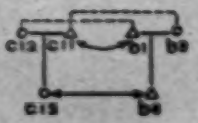

Fig. 18.

The systematic character of this solution is not doubtful. The informants belonging to group b or to group c, when we interrogated them concerning their kinship relationship regarding a male adult of the allied group, never furnished us with a special answer concerning the considered case, but remarked

collectively obliged to make reprisals for an injury done one of its members. Much more often, given the very lively and permanent animosity which reigns between the groups, these pretexts good for exciting the spirit are voluntarily entertained, especially if they feel strong either because of the importance of the group's strength or because of an alliance with neighboring bands against a common enemy, concluded by the intermediary of messengers acting as ambassadors. The proposition of war is presented by an exalted individual or one who exposes before his companions his particular griefs, in the same tone and style that speeches were made at the encounter.

39. ẽ akinãẽ ẽednãẽ ɡõdegãẽ kakonẽẽ ordnẽẽ ɣalaurîsenẽẽ.(b1) whose approximate sense is: "Hello! Come here! Let's go! I am irritated! very irritated! arrows! big arrows!" The Indians become so excited upon the occasion of these epic speeches that it is not possible to obtain the commentary of the formula except well after they have been cited and undoubtedly very unfaithfully. But war is not a matter of purely profane decision. It necessitates a preliminary ceremony which will determine if the signs are favorable or not. Dressed in special attire, tufts of buriti straw dappled with red, hoods of jaguar skin, the men assemble under the leadership of the chief and execute the special dance and chant of war. (1) A divining rite

1. Dances and music will be the object of a special publication.

is then performed. The chief, or the sorcerer in the groups where he exists, goes solemnly to hide an arrow in a corner of the bush. The arrow is retrieved the next day. If it is covered with blood, the expedition is undertaken, if not, it is given up. (2) Many warlike

2. This symbolic use of an arrow seems typical of cultures situated north of the Amazon. The fact is interesting, given the northern affinities of the Nambikwara language. Concerning the use of the arrow as the message of war, cf. Roth, "An inquiry," etc., Annual report of the Bureau of American Ethnology, 30, p. 362; Koch-Grünberg, Zwei Jahre unter den Indianern, etc., Berlin, 1910, Vol. II, p. 316; Gumilla, Historia Natural del Rio Orinoco, Barcelona, 1791, Vol. I, p. 134.

expeditions thus begun end after several kilometers of marching.

423 garden, with the stipulation, of [113] a psychological and moral order, that one wait to take possession until "the memory of the dead [428 has been lost." However, this semijudicial means of acquiring 425] land does not imply the existence of an inheritance right. The relatives are not favored, and anybody can avail oneself of the same title.

GENERAL PSYCHOLOGY AND DAILY LIFE

The Categories

128 The linguistic study of the Nambikwara should be the object of special publications, (1) and we shall thus content ourselves

> 1. C. Lévi-Strauss, Sur certaines similarités, etc., loc. cit.; Paul L. Garvin, Esquisse du Système, etc., loc. cit.

here with several summary pieces of information destined to bring into sharper focus what can be inferred concerning the broad logical categories of thought, and to assign a place to the Nambikwara group within the orbit of other American cultures.

193 The most remarkable trait of the Nambikwara language, ● 197 made particularly evident by the central and southern dialect (b1), 811 is an extended use of the classificatory suffixes. The systematic character of the classification of things and beings is comparable only to that found in the Ŝiḅṣa linguistic family. Furthermore, if one ignores several secondary differences, the division of the world into categories in Nambikwara presents a remarkable similarity with that found in the Ŝiḅṣa dialects. (2)

> 2. The following examples are borrowed from Walter Lehmann, Zentral-Amerika, 2 vols., Berlin, 1920, I, pp. 277-279, 404, 440, 454, 571.

In the division of things and beings into eleven principal logical categories, ten are found to be common to the Nambikwara and to the Ŝiḅṣa. The category "season, weather, sky" seems to be broken up, in Nambikwara, into several suffixes. Inversely, the same suffix -are classes two categories logically related but distinguished by

193 their suffixes in Šibṣa: —nak (Bribri), "excretion, secretion, resin"
197 and -dio, -rio (Bribri), "secretion, damp." (3)
811

3. There would be, naturally, a large number of detailed observations to present. In the different languages, the logical categories partially overlap; thus, the Nambikwara category -kere corresponds partially to the Bribri -kal, and at the same time to -Xkuo. The suffix -kere expresses resistance largely, and the suffix -kate, which we have connected with it, form.

The phonetic analogies which occasionally appear between the classifying suffixes of the Nambikwara and the Šibṣa do not seem to us of great importance. On the other hand, morphological analogy, and above all the division of things and beings into classes which are not imposed on the mind [114] by any internal necessity, do not seem to us to be logically the result of a pure phenomenon of convergence. We see there, on the contrary, sufficient reason to affirm a linguistic affinity between the Šibṣa and Nambikwara groups. (1)

1. In his book Durch Central-Brasilien, Von den Steinen had already suggested the constitution of a linguistic area extending from Colombia to northern Bolivia by a chart of the northern and western distribution of the word sizi (sun, fire). The term sizi can be approximated in Nambikwara: siisu (a1), siise (b1): round hut, circle.

[115] THE NUMBERS

802 The Nambikwara have only three names for numbers, strictly speaking: one, two and many. But they are capable of composing these terms to form higher numbers by addition. We have thus been able to obtain countings up to 5, 6 and 8. To count "one" the Indians hold down with the left hand all the fingers of the right hand except the thumb. To count "two," they hold down the thumb, ring finger, and little finger, leaving up only the index and the middle finger. To count "three," they hold down all fingers except the ring finger. As a matter of fact, as no special word exists for this figure, "three" is no more than a unit added to two. In the central and southern dialect

THE COLORS

§22 The differentiation of colors has been studied in eleven patterns for which we give the list of Indian terms below.

Groups a and b present common characteristics. They distinguish white, black, red, blue, and put yellow and green in a single category. (1) However, while group a extends that assimilation

[193 197 117]

1. The term which designates green and yellow affects the singular form of a reduplicative plural. This morphological aspect is found again in Tupi: Thus in Brikri, green = tapa-tapa, yellow = kilio-kilio; in Guarnso, yellow = mari-mari; in Rama, yellow = nugnugna, green blue = nrinnrinna. (Cf. Lehmann, loc. cit., I, p. 333, 394, 434, 435).

to yellow ocher, group b stops at clear yellow and classes yellow ocher with burnt sienna in the same category, designated by the term of dialect a1 for "black." (2) Group c distributes the colors in a very

[25]

2. In accord with the anthropological judgment of the Indians who do not distinguish themselves from the "whites" as "yellow," but as the "colored" from the "clear":

(36) nẽ ʔanjena uẽẽnẽdnjena (b1)
You are fair (clear), I am dark.

different way: one same category unites the reds and the yellows (which furthermore suggests the scale of the tincture of urucu), while the blues are attached to green and black.

The most esteemed colors are white and black, undoubtedly because these are the colors of the ornaments made from pearly fragments of river shells and from the dark nuts of the palm tree. Then comes red, then yellow. Green and blue are not much liked.
[117]

THE NAMBICUARA

By Claude Lévi-Strauss

TRIBAL DIVISIONS AND HISTORY

The *Nambiquara* (*Nambikwara*, *Mambyara*, *Mahiluva*) have been identified only recently. *Nambiquara*, meaning "long eared," was originally a *Tupi* nickname used since the 18th century for the little-known tribes of the western and northern parts of the Serra dos Parecis. These tribes had large ear and lip plugs, like those of the *Suya* and *Botocudo*, and were called Beiços de Pau, "Wooden Mouths," by the rubber collectors and gold miners. About 1830, they began to make hostile sorties from the region of the upper Sangue River. When, in 1907, General Candido Mariano da Silva Rondon discovered important tribes in the Serra do Norte, he identified them with the *Nambiquara* of the old literature. Thus, *Nambiquara* designates a tribe other than the "Long Ears," or "Wooden Mouths," to whom it was originally applied.

Extending northwest from the Papagaio River more or less to the confluence of the Commemoração and the Barão de Melgaço Rivers, branches of the Machado (Gi-Paraná) River, the region of the *Nambiquara* (map 1, *No. 2*; map 2: map 4) is bounded on the south by the right tributaries of the Gamporé River and, farther west, by the whole of the Commemoração de Floriano River. The northern boundary is unknown but probably runs more or less along the 11th parallel between the Theodore Roosevelt and Papagaio Rivers. (Lat. 10°–15° S., long. 57°–61° W.)

The first classification of the *Nambiquara* was made by Roquette-Pinto (1938, pp. 216–217), who listed four main groups. Lévi-Strauss (n.d. b), using linguistic data, distinguishes three main groups. Two of these, which are subdivided into two groups each, clearly belong to the same linguistic family, but the linguistic affiliation of the third group, which is subdivided, is doubtful. These groups are: *Eastern Nambiquara* (Roquette-Pinto's *Kithãus*, *Cocozus*) between the Papagaio and Juina Rivers; *Northeastern Nambiquara* (Roquette-Pinto's *Anunzes*) in the basins of the Camararé and Doze de Outubro Rivers; *Central* and *Southern*

[Not processed for the File. - Handler]

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

Nambicuara (Roquette-Pinto's *Uainiaça*, which includes his *Kabishi*, *Taquemi*, *Tamaid*, *Tarunt*, and *Tashaidi*) between the Gaspar River Basin in the south and the Tenente Marques, Ikê and Roosevelt Rivers in the north and northwest; *Western Nambicuara* (new), closely related to the central and southern groups and living on the headwaters and in the upper basin of the Roosevelt River; and *Northern Nambicuara* (new), speaking its own language and living north of the central group.

The Indians mention other tribes north of the *Nambicuara*; one called *Salumã*, *Sarumã*, or *Saimdé* is almost certainly the *Mundurucú*; another may be the *Tajaoyaona*.

In 1907, Rondón estimated the total *Nambicuara* population to be 20,000. In 1912 Roquette-Pinto met 1,000 to 1,500. It is doubtful whether the total population, which has been decimated by several recent epidemics, now greatly exceeds 1,500.

The *Nambicuara* language was previously thought to be isolated, but its distinctive trait—the use of classificatory suffixes dividing the universe into about ten categories—is strongly reminiscent of *Chibcha*.

Nambicuara culture, although less primitive than that of the *Siriono* to the southwest, is strikingly simple in comparison with that of the neighboring *Paressi* to the southeast and of the *Tupí-Cawahib* to the northwest. Their lack of the hammock, their custom of sleeping on the ground, their crude ceramics (the *Eastern Nambicuara* entirely lack pottery), the nakedness of both sexes, their nomadism, their use of temporary shelters during most of the year, the general poverty of their material culture, and the simplicity of their social organization distinguish them from the higher cultures of the Gaspar River area, to which they nevertheless probably belong.

CULTURE

SUBSISTENCE

The *Nambicuara* habitat is a savannalike plateau about 500 to 1,500 feet (150 to 500 m.) above sea level with an arenaceous soil which comes from disintegrated sandstone bedrock. Except for narrow gallery forests along river banks, the region is infertile, having only shrubs and small trees with thorns or thick bark.

In this unproductive environment the *Nambicuara* have a dual subsistence pattern. They are both semisedentary bush dwellers and incipient farmers. During the dry season, women, accompanied by their children, forage with digging sticks for wild fruits, seeds, and roots, and catch grubs, rats, bats, spiders, snakes, lizards, and other small creatures, while men hunt what large game they can find with bows and arrows and collect wild honey.

SP17 Nambicuara SP17

ties down to their smallest details. There is, undoubtedly, a function in chieftainship. This can, however, be reached only through analysis as the underlying principle of the institution. In other words, the differing structure of the digestive organs in man, ox, fish and clam do not point toward different functions of the digestive system. The function is always and everywhere the same, and can be better studied, and more fully understood where it exists under a simple form—for instance, in a mollusc. Similarly, and as Professor Lowie once wrote, if anthropology is to be considered as a scientific study, its subject matter cannot be individual cultures, but culture taken as a whole; the rôle of individual cultures being to offer, according to their own characteristics, special angles from which the basic functions of culture, although universal in application, can be more easily reached.

This will perhaps help us to eliminate preliminary questions which otherwise could have proved very difficult. Anthropologists in South America and elsewhere have been eagerly debating the question of whether those South American tribes—nomadic, relying mostly on collecting and gathering, with little or no agriculture, little or no pottery, and, in some cases, with no dwelling other than crude shelters—should be considered as truly primitive and as having preserved their exceptionally low cultural level through tarriance, or whether they did not previously possess a higher type of social and material organization and have regressed to a pseudo-archaism under unfavorable circumstances. The Nambikuara are one of those tribes which, along with the Siriono, on the other side of the Guaporé valley, the Cayapo, Bororo, Karaja of central Brazil, the so-called *Gé* of Central and Eastern Brazil, and some others, together form a kernel of primitiveness surrounded, in the West, by the higher tribes of the upper Amazon, the Bolivian plain and the Chaco, and from the Orenoco's to the La Plata's estuaries, by a coastal strip inhabited mostly by the Arawak, Carib and Tupi-Guarani linguistic families. An independent linguistic stock divided into several dialects, the Nambikuara seem to display one of the more backward cultures in South America. At least, some of their bands do not build huts and are wholly ignorant of pottery and, even among the others, these two arts are exceedingly poor. There is no weaving, except for the narrow arm and leg bands which are made of cotton; no dress whatsoever, either for the men or for the women; no sleeping contrivances, such as hammocks or platforms; the natives being used to sleeping on the bare ground without the protection of blankets, mats or hides.

101 are their enemies whom they call the Salumá or Saltoré, probably the Apiões whom the local Brazilians call the Beiço de Pau, owing to the fact that they wear labrets.

[197] 13 101 Linguistically the Nambicuara are divided into an Eastern and a Western group. Both the Eastern and Western Nambicuara, in turn, are dialectally subdivided. The Eastern group is made up today of four bands: the Elétaun situated south of the telegraph line on the Rio Formiga, a tributary of the Suiua River; the Wakítiau just north of the telegraph line on the Juruena River; the Kitánhlu south of the telegraph line on the Camararé River; and the Chiwtáu now including the Hágudiau north of the telegraph line on the Camararé River. The Eastern bands thus extend on both sides of the telegraph line from Utiarity to Vilhena. The Western Nambicuara are composed of at least three bands, the Wándiau on the Kabishí River (a tributary of the Gumperé River), the Tãondiau and Soédndiau on the upper Roosevelt River. The above-mentioned names were given by Julio of the Wakítiau band. The different subdivisions of the Nambicuara have been called various names in the reports. As far as concerns the Eastern Nambicuara the following names appear to be synonymous. For instance, the local Brazilians call the Wakítiau, Elétaun, and Kitánhlu the Iritoe; these names appear to cover at least part of the people whom Roquette-Pinto called the Kokoré. The combined Chiwtáu and Hágudiau are called the Mandúca by the local people, and the Anunás by Roquette-Pinto. Or, to put it another way, the Eastern Nambicuara of the literature are divided into the Kokoré and the Anunás by Roquette-Pinto, and into the Iritoe and Mandúca by the Brazilians who live in the region.

101 62 The confusion in band names in all probability has arisen from the changes in band organization in the last half century. Fifty years ago the Nambicuara were far more numerous than they are today, and no doubt the number of bands was also greater than today. The extension of the name of an important band to lesser bands is thus quite conceivable. 62 The economy of the Nambicuara appears to indicate that there are maximum and minimum limits to the size of a band. If it grows too large for a given area to support, it will break up, or if it becomes so small that its economic

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

sometimes the fathers of several children, walking together at dusk and tenderly embracing each other; always

[illegible]

(these are) brothers-in-law embracing (each other).

Certain games, too, such as the "scratch game" (in which the opponents try to scratch each other especially in the face), are commonly played by brothers-in-law.

But the close relationship between "cross cousins actually or potentially allied through a sister's marriage"—the more accurate translation of the aboriginal term for brother-in-law—may extend far beyond the family tie. Actually, it is sometimes used to establish between individuals not belonging to the same kin group new links of a special nature, the function of which is to amalgamate into a single familial unit several formerly unrelated groups. This is brought out clearly in the following case.

During the past twenty years, several epidemics nearly destroyed the central, northern and western divisions of the Nambikuara. Several groups were decimated to such an extent that they could no longer successfully maintain a socially autonomous existence. In the hope of reconstituting functioning units, some of these, therefore, attempted to join forces. In the course of our fieldwork we met and worked with such a merged group made up of seventeen individuals using the northern dialect (*Sabáne* group) and thirty-four using the central dialect (*Tawándy* group). Each of the originally distinct groups, however, lived under the guidance of its own chief, although both leaders closely cooperated. It is probable that the demographic crisis did not by itself account for this situation, since the people of the second group formed merely a fraction of a more numerous unit from which it had split off for reasons unknown to us. However, from several events which occurred during our stay with them, we deduced that the break had been caused by political dissension, the details of which remained obscure to us. In any event, these groups now travelled and lived together although two separate but contiguous camps were maintained in which the families formed distinct circles, each around its own fire. The most amazing feature of this curious organization was that the two groups did not speak the same language and were able to understand one another only through interpreters; fortunately, one or two individuals belonging to each group had sufficient knowledge of the other dialect to act as intermediaries. Even the two chiefs could not communicate directly. The problem of whether these dialects belong to the same linguistic stock need not be raised here; but the Northern group undoubtedly must be classified with the Nambikuara cultural family because of the similarities of material culture and of the life pattern, and chiefly because of the psychological attitude of the people, who very evidently believed in their close affinity to the Central group.

the Cocozu in circular pits, the Tagnani in elongated graves.

§20 The concept of number is well under way among the Indians of the Serra do Norte. In their expressive manner, they count on their fingers and say "Dêta" for each unit.

§21 When they have used up the fingers of both hands, if the number demands it, they lift a foot, repeating the same word, and then go on to the other foot.

A Tagnani chief who wanted to say that his people were already near and were bringing us manioc, maize, etc., in many baskets, having counted on all his fingers and toes, tapped the hands and feet of others present, repeating all the while, "Dêta, dêta, dêta" (this, this, this).

§20 To count the days, either past or future, which stand between them and a certain place, they raise their right hand to the face, rest their head on the palm, close their eyes, and produce a loud snore for every night to be counted.

§22 The concepts of shape and area are also defined among them. The Cocozu call a circle kuagçá, a triangle sendzu. Perhaps these words are merely names of animals or objects extended to cover these figures, which they trace accurately.

[Fig. 46]

§21 They distinguish east and west. They indicate the approximate time of day by pointing out the place where the sun will stand on the horizon [260] at that particular hour. They do not seem to distinguish among constellations; they always gave the same name to any star we pointed out to them. The Tagnani indiscriminately named tuggê the Belt in the Orion constellation which they drew on the ground, as well as the largest stars in this exceptionally beautiful cluster (Rigel, Betelgeuse and Bellatrix). The total eclipse of the sun which was clearly noticeable in the Serra do Norte on October 10, 1912, made no impression whatever on the Nambikwara.

§27 As to the biological concepts they may perchance have gathered, we cannot yet speak about them. What we were able to ascertain did not satisfy us.

[Fig. 47]

§17 The Indians of the Serra do Norte speak distinct but related dialects which are mutually intelligible.

[94] The consonants are b, c, d, g, h, k, l, m, n, r, s, t, z; h is always strongly aspirated, like German ch.

F, j, v, and x are lacking.

The following consonant clusters are characteristic: nn, kr, tch, dn, gn, tg, tn, kd, kz, kr, nt, nz, tz, td, ng, ng, tnh, gg, gd, ndz, nk.

[95] Those words designating parts of the human body have the same root in all Nambicuara dialects, slightly modified in one case or another: uá or tuá.

[264]

	Cocozu	Tagnani	Tawite	Anunze
Arm	Oá-nukicú	Uá-nuirí	Toá-rahenuí	Uá-nukiuí
Mouth	Toá-inçú	Uá-iurí	Tá-iuirí	Uá-iuerí
Tongue	Toáio-herú	Uái-hihuí	Táiu-henuú	Uáile-herú

Here the particle tua (uá, oá) has the same possessive value as the nu particle of Arawakan languages; it is found only in words pertaining to parts of the human body. (1)

[93]

1. See E. Roquette-Pinto, "The Indians of Serra do Norte," [Engl.] Proceedings of the Second Pan-American Scientific Congress (Washington, 1917).

[Fig. 58]

Nearly all Cocozu words end in nu or çu, used interchangeably. Anunze words often end in uí. But this last sound, to be pronounced properly, must be approximated to çú. (2) In the Tawite dialect and

2. This may be a linguistic trait of Go parentage. (H. A. T.)

/are common,

in the several Tagnani dialects, endings in ái, ú, rú, and ri (suit ç)

[97] [98] One particle found rather frequently in these dialects deserves special mention, owing to its importance for the [264] evaluation of

relationships with other American languages. This is the gui or gue particle:

Kaiguetaná -- flute (Cocoza)
Hauguidê -- smooth arrow (Tapanaí)
Tokiguedoiuê -- hand (Tawite)
Uóuguêtu -- head (Amunze)

Although various phonetic systems are in existence for the transcription of primitive languages (Kosmos Alphabet, Schmidt's Alphabet, etc.) (1), I deemed it preferable to use the letters of the

1. Pe. W. Schmidt (Anthropos, 1907) describes in detail the historical evolution of phonetics and the various systems which have been suggested. In the same paper he presents his own method, which has been granted wide acceptance.

Latin alphabet in conjunction with a few special signs such as the umlaut, which are within the grasp of any reader.

[Fig. 51]

If Martius' linguistic scheme were still accepted, the Nambicuara tongue would be included among the languages of the "Guck" or "Kolo" group. This family, however, was not maintained in view of its great diversity, and now its former members are [considered] to belong to the Ge-Botocudo and Nu-Arawakan groups.

The languages of the Nu-Arawakan family, however, own certain significant characteristics which are not encountered among the dialects of the Serra do Norte.

For instance, the personal possessive particle nu, one of the most valuable traits in the identification of these languages, is never found among the Nambicuara.

[285] The word used to designate water, one of the best elements for purposes of linguistic comparison because of its constancy throughout the Nu-Arawakan dialects in spite of other differences (nuê, nú), has no equivalent in the Serra do Norte.

194
197 These traits alone would be sufficient to set the Nambicuara language apart from the Nu-Aruaquian dialects.

But beyond this, it is easy to verify the dissimilarity between the lexicons [of these two groups]. Compare the Parecí vocabulary, an excellent representative of the Nu-Aruaquian family, with the word lists of the Serra do Norte Indians. They are completely different.

We would search in vain through South America for a language possessing any deep affinities with the Nambicuara dialects.

[Fig. 82]

It is true, however, that the language of the Xingu River Suya bears a certain resemblance to the dialects of the Serra do Norte. The possessive particle wan of the Suya, which is clearly found among the Nambicuara in the form of either ua or ue, constitutes the best argument in favor of this relationship.

In view of this characteristic, therefore--and it is a significant one for it has served as a basis for the modern classification of our tribes--[288] wherever the Suya are placed the Nambicuara should also be included. (1)

[13]

1. In "Beiträge zur Ethnographie des Araguaya-Xingú Gebietes [Contribution to the Ethnography of the Araguaia-Xingu District]," Proceedings of the XXI International Congress of Americanists (Göteborg, 1924), Fritz Krause confirmed this linguistic affinity and attempted to make it even closer by citing additional words akin not only to Caraja but also to Ge dialects.

As to cultural aspects, it becomes obvious, especially in view of Nordenskiöld's comparative ethnographic studies, that the Nambicuara as well as the Caraja have been influenced by sub-Andean culture.

The Caraja show signs of being partially subjected to this influence at the time when

7;Roquette-Pinto--52 E-4, 5 (no date) 1938 SP17 Nambicuara SP17
(ca. 1912)

MA
SP17

It reached the Chaco region, where they would thus appear to have lived at an earlier time. (See Krause, op. cit.)

On the other hand, as already pointed out elsewhere, the Nambicuara seem to have received this cultural influx by way of a different route--probably through the other channel of sub-Andean cultural expansion described by Nordenskjöld, which ran from northeastern Bolivia down the Amazon and La Plata watersheds. (Nordenskjöld, op. cit., Vol. I).

(H. A. T.)

This is perhaps where the problem becomes most difficult: although Ehrenreich places the Xingu Indians alongside the Ge, other experts on South American linguistics believe, perhaps rightly, that they should be included with the Carajá in Chamberlain's "Carajan" group. (2)

2. Krickeberg, Rivet, and other experts still place the Suyá among the Ge.

[Fig. 63]

Yet it is also inevitable to recognize in the Nambicuara language certain special characteristics of the Kiriri tongue. These traits are exclusively phonic, and [thus much less significant than if they were lexical or morphological.

[267] They merely consist of the ng, tz and ky sounds, which may accepted as peculiar to the Kiriri language (Bayma Cavcant).

In the absence of well translated texts, it is impossible to delve more deeply into the study of these dialects. Even the relationships suggested above will be subject to revision when more complete linguistic materials become available.

GII As regards the [National] Museum collection, the following data are worthy of note.

LINGUISTIC COMPARISONS

	NAMBICUARA				Chicrisaba (Martius)	Cherente (Martius)	Camacan (Martius)	Caraja (Ehrenreich)	Suya (K. von den Steinen)

[Fig. 70]

177 Their plaiting follows patterns clearly characteristic of the
[213] Xingu (Trumai and Nahuqua) and gives proof of contact with those backward tribes which the rudimentary culture of the Nambicuara had already implied.

[154] The quadrangular barbecue, which differs from the usual pattern, is used only by the more advanced groups (Tagnani, etc.); it recalls the barbecue of the Javahe as depicted by Fritz Krause. (1)

1. F. Krause, In Den Wildnissen Brasiliens [In the Brazilian Wilderness] (Leipzig, 1911).

[206] The straw ornaments of the Nambicuara are quite similar to
177 those of the Suya. But linguistic affinities are even more indicative of contact between the two groups. No other people speaks a dialect [310] so similar to that of the Nambicuara in terms of word morphology, although the two languages are otherwise quite different.

171 It is interesting that a spontaneous affinity should arise be-
177 tween two remote and equally primitive tribes, the Guayaki of Paraguay and the Nambicuara of the Serra do Norte, from their common use of the jaguar hide helmet.

However, I am inclined to believe that the latter copied it from their neighbors, the Cayabi of the Paranaiuba River, who use helmets of the same material.

176 Unfamiliarity with the banana tree and with the pipe (an ob-
171 ject frequently encountered in North American mounds and Brazilian sambaquis) indicates how long the Nambicuara have been established in their mountain range.

Recognition of the Ge-Botocudo group as one of the oldest representatives of aboriginal South American populations is no longer a matter of dispute. . . . .

171 [311] There is no doubt, in my opinion, that the [Brazilian] linguistic groupings correspond to ascending stages of civilization [312]. . . . . The Serra do Norte is inhabited by a people of Ge culture evolving toward the Nu-Aruaquan culture, of which they have barely reached the initial stages.

126

1. It is necessary to define more exactly the manner in which these texts, and those which follow, have been obtained. We have not had the aid of any interpreter. At the time of our stay there was only one, a Nambikwara Indian educated far from his own people by the Jesuit fathers, and whom unfortunately, we could not employ. The Indians in contact with the posts of the telegraph line use, in their relations with the Parecsi or Brazilian employees, a sort of "sabir", formed about forty words, one part Indian and the other Portuguese. This ingenious language, accompanied by numerous gestures, served as an introduction. At the end of about three months we had achieved a grossly empiric knowledge of Nambikwara itself, permitting us to make ourselves understood by the Indians, and more or less to follow a conversation. This result could not have been obtained without the tireless good will of the informants always ready to exchange words (Nambikwara for French or Portuguese) and to develop the obscure points by the use of an appropriate sign language. Working with these methods of chance we have both noted in passing fragments of conversation which were not addressed to us, and collected information by dictation. In both cases, the interpretation of the text was taken up again, afterwards, with the informants. It goes without saying that a meaning established in such a superficial way is not free from inaccuracies which sometimes may prove to be gross. We do not publish them for their literal meaning, often subject to caution, but rather because of the rough impression of indigenous life and atmosphere which they nevertheless aid to recreate. For the transcriptions, we are indebted to Mr. Paul L. Garvin for those which he established with the aid of our travel notes, and which he uses in his "Esquisse de système phonologique du Nambikwara-Tarundé," which appears in the Journal de la Société des Américanistes de Paris, 1948.

[P] fat pieces of meat is a constantly relished dream, even though rarely
[S3] realized. On the other hand, the provisions haphazardly collected are
[S2] considered—and really are—the daily misery. In Nambikwara folk-
[S3] lore, the expression "to eat grasshoppers" (tʃʃere gʃʃige, bl), a
[S2] typically feminine and infantile harvest, is nearly equivalent to the
French "to eat the mad cow" (to rough it). At the same time the
woman is considered a tender and good being, but of the second
[P] order. The language which she uses habitually separates her from
the men and unites her with the children (in the same way that she
collaborates with the children in expeditions of collecting and glean-
ing). We shall see later that this assimilation also continues into the
metaphysical thinking and that, on this latter plan, discrimination
between the sexes attains proportions whose psychological attitudes
are only a derisive indication. It is considered well-bred for men to
speak of women with a pitying good will, and, in conversations be-
tween the two sexes, to address them with a slightly mocking indul-
gence. Certain sayings are heard often among men speaking among
themselves:

[S3] 5. [illegible] (bl)
The children do not know, I know, the women do not know.

and they bring up the group of women (dem, al), their jokes, their
conversations, with a tone of tenderness and mockery. But, of course,
that is only [ST] a social attitude. When the man finds himself
alone with his wife around the camp fire, he listens to her com-
plaints, considers her demands attentively, asks her help in a hun-
dred undertakings. The male line of talk disappears, and gives way
to the collaboration of two partners conscious of the essential value
which they have for one another.

[P] This ambiguity of male attitude as regards women has its exact
[S2] correspondence in the equally ambivalent behavior of the female
group. The women think of themselves collectively, and manifest
it in several ways. In the first place they do not talk like the men.
Even though a sexual language does not exist in the true sense of the
word, in conversation a thousand inflections, shades of pronunciation
are found which are typically feminine. Women articulate badly
and affect a sort of jabbering which is reminiscent of infants' pro-
nunciation. They whisper instead of talking out loud, and emit
sounds with an affected mannerism and precisity which are at times
seductive when they are not exasperating. Thus, in dialect al, they
give words an ending -h instead of the usual -n or -m. They
also pronounce -hitʃo, the verbal suffix which is for men, -hotʃero
or -hotʃero.

198 It is certain that they are perfectly aware of this peculiarity.
562 when one does not understand them and asks them to repeat, they exaggerate maliciously, and more each time, the style that is particular to them, and when one desists, discouraged, they laugh and exchange jokes. They have succeeded. This is especially true of young women who do not yet have children, and of young concubines. The mothers and older women stress these differences less, although one also finds them among this group upon occasion. Besides, the young women like the society of children and adolescents, play and joke constantly with them; and it is the women who take care of the animals in that very human way peculiar to certain South American Indians. All this contributes to creating a special atmosphere around the women, in the interior of the group, at the same time child-like, happy, affected and provocative, in which the men participate when they return from the hunt or the gardens.

462 But a completely different attitude is manifested among the women when they are to undertake some one of the forms of activity which are especially intrusted to them. They accomplish their tasks as artisans with ability and patience, in the solitary camp, arranged in a circle and with their backs to one another, and, during trips they valiantly carry the heavy basket which contains the provisions and riches of the whole family and the quiver of arrows, while the husband walks ahead with the bow and one or two arrows, the wooden spear or the digging implement, looking for the flight of an animal or a fruit tree. One sees these women then, the forehead bound with the tump line, the back completely covered by the wide basket in the form of an inverted bell, walking for kilometers with their characteristic step, [58] the thighs very tense, the knees together, the ankles turned out, the feet turned in; leaning on the outer edge of the foot and moving the hips, courageous, energetic and gay. We give on the opposite page a chart of the division of tasks between the sexes, but this division should be interpreted in a less strict manner than usual for phenomena of this type. Among the Nambikwara collaboration between husband and wife is carried so far that many tasks are done jointly. More exactly, if the man rarely intervenes in feminine tasks, the woman on the other hand (and above all the supplementary wives in case of polygamy) unceasingly aid their husband. We have indicated by crosses between parentheses the cases where a task attributed to one sex is occasionally practiced by the other. Thus, when they are alone or among themselves, the men do the carrying, but they do not carry from the forehead (nevertheless, a[illegible]

[101] 187 648 The Parecí call the Nambicuara "those who sleep on the ground" and ridicule them in other ways. One does not have to remain long among the Nambicuara in order to feel this underlying hatred, mistrust, and despair, which create in the observer a feeling of depression not unmixed with sympathy.

•198 The Nambicuara is the only tribe I have met who speak pidgin Portuguese, which without some training is almost unintelligible. For instance "bastante" becomes mawate, "pequeno" becomes shiki, "grande" becomes pepei, and "criança" becomes pinin. If they wish to compare two things to bring out a likeness they say this thing is the brother of something else.

142 171 Compared with their neighbors, the Parecí and Irantxe, the Nambicuara are taller, darker, and longer-headed. It is very easy, for instance, even at a distance, to distinguish Nambicuara children from Parecí children when they are bathing in the river. In contrast to the light brown of the Parecí skin the Nambicuara skin appears to have an element of black that gives it a dark-gray undertone. Many individuals have a certain amount of wave in their hair, although the waviness may be accentuated by the unkempt matted condition of the hair. Detailed measurements and indexes are given in Appendix 2.[1] The eyes of the Nambicuara are very dark brown, almost black in some individuals, and have a brightness which contrasts sharply with the rather dull eye of the Parecí. The only other Indians that I have met with this brightness of the eye are the Cadiveu. This brilliance of the eyes does not appear to be correlated with health, for even the sick have it among both peoples.

131 The Nambicuara, as a whole, occupy a territory bounded on the east by the Papagaio River and on the west by the headwaters of the Rio Roosevelt and the Pimenta Bueno River. To the south they extend as far as the headwaters of the Rio Juruena and the Rio Kabihlé. To the north they are bounded by a line running roughly from latitude 12°30' on the Papagaio River to latitude 11° on the Rio Roosevelt. Formerly, it is believed, they extended farther northward. The telegraph line runs through Nambicuara territory beginning at Utiarity and ending at Barão de Melgaço in the west. The territory to the south and east 101 of the Nambicuara is occupied by the remnants of the Parecí. To the north of the Nambicuara

[1] [See col. 44 [28 IX-A.]] [p. 83 (a)]

LLévi-Strauss--Tl E-S (1938-1939)1948 SP17 Nambicuara SP17

841 147 171 among South-American Indians. Since the sixteenth century, travelers have often been amazed by the insignificance of the menses of Indian women. Thus: "In the period of about one year which we spent in that country, ordinarily associating with the people, we have never seen the women have their menses" (J. de Léry, Voyage faict en la Terre du Brésil, Gaffarel, Paris, 1880, Vol. II, Ch. 17, p. 92); and more recently: "no one notes when they go through certain difficult periods peculiar to their sex" (Tocantins, "Estudos sobre os Mundurucus," Revista do Instituto Historico e Geographico Brasileiro, Vol. 40, 1877, p. 113). On the other hand, the text just cited could be interpreted in two different ways: the vocal inflexion of the informant suggested that the expression *odôde odôde odôde* signified "(this) moon (yes), (this) moon (no), (and this) moon (again)", meaning "every other moon" and not—as it is also grammatically possible—"moon, moon, moon," that is "every moon." The first sense would constitute a sort of physiological scandal, but remains, nevertheless the most probable. In fact, it is possible that the periodic indispositions are less important and more irregular among South-American women than is the case among the whites.

842 The Nhambikwara have a very clear idea of the relationship between sexual intercourse and conception. It is frequent that an Indian [20] certifies that paternity relationship is one of the blood, and not classificatory, by forming a ring with the thumb and index finger of the left hand, into which he introduces the index finger of the right hand which he glides back and forth. After this demonstration, he indicates the child saying: *tagêtse, tagêtse*, "my child, my child" (3).

3. From the same observation made by Roquette Pinto (loc. cit. p. 208) more than twenty years earlier, one can conclude that this gesture does not constitute an individual innovation, but a stylized social conduct.

842 Etymology points out the connection between the two phenomena. 843 In the eastern dialect, "copulate" is translated *sôlêwôdêtse* and, in 847 the central and southern dialects, *tasôlêdêge*, *tagôtsêe*. These three terms are attached to the respective forms [66] for "father": *sôgôtsêe* (*sô* = man, *ô*), *tasôlêde*, *sôlêe*. On the other hand, in the northern

1:Lévi-Strauss--96 E-6 (1938-1939)1948 SP17 Nambikwara SP17

238 Because of the fact of partial polygamy which reigns within
[375] the group, and which is manifested in the fact that the youngest
382 and prettiest women are periodically withdrawn by the chief or
406 the shaman from the regular cycle of marriage, the young men often find themselves in difficulty as regards marriage, at least during part of their adolescence, no potential wife being available. This problem is resolved by homosexual relationships, which the Nambikwara language (bi) has named poetically: tamindige kihidige, that is faint love. These relationships are frequent among young people and are carried on much more publicly than sexual relations. The couples do not retire to the bush as the adults usually do. They install themselves near a fire of the camp under the amused eyes of the neighbors. The incident gives rise to some joking comments, usually not carried very far. These relations are considered infantile, and hardly any attention is paid them. The question remains unanswered for us as to whether these practices are carried on to complete satisfaction, or are limited to sentimental effusions, accompanied by erotic play such as those which characterize, for the most part, relations between husband and wife. Whatever the case may be, the essential point here is that homosexual relations are exclusively relations between cross cousins. Whenever one seeks information from an Indian concerning a relationship of the type just described, the typical response obtained is:

25. tamindige tamihdige (bi)
(those are) two brothers-in-law making love.

238 We have not been able to ascertain if these relationships of
[375] adolescence continue between adults. It seems hardly probable.
407 But relationships of a very special nature are maintained between brothers-in-law. They exhibit great familiarity toward one another, have among themselves effusions such as we have never noted among brothers or relatives of another degree. Among the
● [201] Nambikwara (always prodigious, of course, with affectionate gestures) it is not rare to see two or three men, married and fathers of families, walking in the evening tenderly embracing. The information obtained is, here too, always the same:

26. tantin ialiagtun. (bi)
The brothers-in-law are embracing.

407 Certain games, like the "the game of claws (griffes)"
[379] (najakitsunhi, 9) are frequent among brothers-in-law.

648 37. tamalo ãtse mundjare mundjandjare ajaã' (bl)
649 The Yamande sing well; as for me, I cannot sing well any more!
● 201 In one case which we witnessed, the general tone was quickly raised with the excitement of the meeting, and the night had not yet ended before the speeches mixed with chants made an extraordinary uproar, whose significance escaped us completely. Menacing gestures were outlined, sometimes even some scuffles were produced while other Indians intervened as mediators. All of these hostile manifestations are stylized, and end as gestures calling to mind sexual parts of the body. On the part of the aggressor, menace, or the gesture of Nambikwara hostility, consists of seizing the penis with two hands and directing it towards the adversary while inflating the stomach and thrusting it out, and of flexing the knees (the men also make this gesture in fun toward children when they wish to get rid of them). The second stage consists of an act of aggression toward the person
[201] of the adversary, with a view to tearing off the piece of hairi straw attached to the front of the waist, above the sex organs. The latter "are hidden by the straw" and "they fight to tear away the straw." This action is entirely symbolic, for the covering of the male sex organs is made of such fragile material and is reduced so small in size (and often non-existent) that it is out of the question for it to assure protection of or be any kind of covering for the organs. Another form of aggression consists of seizing the adversary's bow and arrows and laying them aside. In all of these actions the attitude of the Indians is extremely tense as if they were (and really, they are) in a state of violent and contained anger. Doubtless these brawls degenerate at times into generalized conflicts, but in our case, they calmed down at dawn. Always [91] in the same state of apparent irritation, and with gestures devoid of friendship, the adversaries looked at one another to inspect one another, rapidly
[201] feeling the earrings, the cotton bracelets, the little feather ornaments, while murmuring rapid words:

38. nãwi nãwi nãwi nãwi munintãi (bl)
Give, give, me, me, it is pretty!

648 This "inspection of reconciliation" marks the normal conclusion
649 of the conflict. And actually it is this which introduces the new aspect which the relationships between the two groups are going to take--commercial exchanges. However summary the material culture of the Nambikwara may be, the products of the industry of the different groups are highly prized by their neighbors. The eastern groups need pottery and seeds, the northern and central groups consider

T: Roquette-Pinto--'28 E-4, 5 (no date)1938 SP17 Nambicuara SP17
(ca. 1912)

518 At the post of Tôa Burítis, where they camped with us for a few days, they disputed every night the occupancy of a crude wooden table where the station personnel ate their meals; they already appreciated our habit of sleeping above the ground.

Why, then, did they not make use of the hammocks? Because they were not familiar with it.

[268 125] They are capable of plaiting cotton and tucum (1) thread more

1. Bactris setosa (Ed.).

than adequately enough to make a hammock; and they are also capable of appreciating their neighbor's hammock, as indeed they do now.

This ethnographic trait attests to the inferior position of the Serra do Norte Indians.

[77] [228] This unfamiliarity [with the hammock] is in fact characteristic of the large Ge-Botocudo group of Brazil, which in the consensus of all who have studied it comprises the most backward aborigines in the Americas.

All Serra do Norte Indians sleep directly upon the earth. They spread nothing in the way of leaves, straw, pallets or hides between themselves and the ground.

They nearly always rest on their side, pillowing the head on the forearm.

516 The men rarely sit directly on the ground; they usually squat. The women do the reverse. If standing in one spot for more than a few minutes, a man will usually flex one leg and rest his foot against the other knee; the women assume a characteristic posture which I have never seen described and which is clearly shown on the photographs we took.

They cross their thighs, thrusting the right part of the pelvis forward and the left part forcibly backward. The longitudinal axis of the right foot, if extended, cuts that of the left foot almost at a right angle.

They frequently cross their arms.

281 When excited or roused by happiness or fear, they repeatedly slap the back of their head with their open right hand. When displeased, they make the same gesture while exclaiming: "Ikhmerá!"

512 treated with great affection. The men are jealous of their wives, and
[137] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paressi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uérê!" (son).

858 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urutau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own atigú and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[171] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunsu threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--
the Cocozu in circular pits, the Tagnani in elongated graves.

the Cocozu in circular pits, the Tagnani in elongated graves.

802 The concept of number is well under way among the Indians of the Serra do Norte. In their expressive manner, they count on their fingers and say "Dêra" for each unit.

802 When they have used up the fingers of both hands, if the num-
201 ber demands it, they lift a foot, repeating the same word, and then go on to the other foot.

A Tagnani chief who wanted to say that his people were already near and were bringing us manioc, maize, etc., in many baskets, having counted on all his fingers and toes, tapped the hands and feet of others present, repeating all the while, "Dêra, dêra, dêra" (this, this, this).

805 To count the days, either past or future, which stand between them and a certain place, they raise their right hand to the face, rest their head on the palm, close their eyes, and produce a loud snore for every night to be counted.

822 The concepts of shape and area are also defined among them. The Cocozu call a circle kengçú, a triangle nendzu. Perhaps these words are merely names of animals or objects extended to cover these figures, which they trace accurately.

[Fig. 46]

821 They distinguish east and west. They indicate the approximate time of day by pointing out the place where the sun will stand on the horizon [260] at that particular hour. They do not seem to distinguish among constellations; they always gave the same name to any star we pointed out to them. The Tagnani indiscriminately named tangré the Belt in the Orion constellation which they drew on the ground, as well as the largest stars in this exceptionally beautiful cluster (Rigel, Betelgeuse and Belatrix). The total eclipse of the sun which was clearly noticeable in the Serra do Norte on October 10, 1912, made no impression whatever on the Nambicuara.

000 As to the biological concepts they may perchance have gathered, we cannot yet speak about them. What we were able to ascertain did not satisfy us.

[Fig. 47]

197 The Indians of the Serra do Norte speak distinct but related dialects which are mutually intelligible.

721 Excitement and enthusiasm decline, and the group returns home.
But some are pushed until realized, [95] and can be very murderous.
726 The Nambikwara usually attack at dawn and extend their ambush by
dispersing throughout the bush. The signal for attack is given from
[53* 203] place to place, thanks to the whistle which the Indians carry hanging
from their necks. This little whistle, composed of two bamboo tubes
[136] tied with cotton thread reproduces the cry of the cricket approximately,
and doubtless for that reason has the same name (kalĩdir) as this insect.

MAGIC, RITES AND RELIGIOUS BELIEFS

278 Some beliefs of a magical and religious character also play
[176] their role in social life. The most important is the notion of
nande (hi). To analyse it, we should first say a few words con-
cerning poisons. The Nambikwara are very expert poisoners. They
make curare for their arrows, or at least for some of them, pre-
[415] served in little earthen pots. (1) Without enlarging here upon the

1. The study of the Nambikwara curare was made, on the occasion of our expedition, by our friend and companion Dr. J. A. Vellard. Cf. Vellard, "A preparação do curare pelos Nambikwaras," Revista do Archivo Municipal de São Paulo, LIX, 1939, p. 5-16; "Communication à l'Académie de Médicine de Paris," id. LVIII, 1931, p. 117-118.

manufacture of the curare, it must be noted that this preparation, although reserved for chiefs and sorcerers, is not surrounded by any ritual and does not give rise to any magical operation. The Indians make the curare publicly, applying recipes and taking precautions which are either essential to the effectiveness of the product or which constitute simple prejudices, but all of which have a positive character. Their attitude towards this poison thus may be considered as scientific. Along with curare, the Nambikwara know other poisons likewise of vegetable origin, and which take the form of powders
[415] contained in small tubes. These are made of quills, feathers, or stalks of bamboo or other wood, cleaned out and corked at both ends with a piece of vegetable pith or cotton, and at times decorated with red dots and lines made with urucu paste. (2) These tubes are

2. Cf. Rondonia. Roquette Pinto collected examples of these tubes and reproduced one of them (Rondonia,

653 and she opened the nut and threw the viscera and
282 the nut on the coals. Within 15 minutes that nut was eaten, entrails and all, while Kaure and I looked on in a state of horrified fascination.
[642] Children thus begin by eating broiled meat and fish; pieces of sour, gritty manioc cake are given to them at a more advanced age.

PUBERTY

811 When a boy reaches the age of 14 or 15 he has
[304] his upper lip and the septum of his nose pierced with a sharpened fibula of a monkey ("macaco-preto"). One man holds the boy's arms, another his head, while an older male relative performs the piercing. Small plugs of bamboo are then placed in the holes. The following night the shaman leads the band in singing and dancing. Food is prepared in large quantities and offerings are made to the ghosts who are believed to be present
[553] at the ceremony. The boy is now given a name which he will keep throughout his life. If the boy's father is dead he will use his father's name. If the father is alive he will use the name of some dead member in his grandfather's generation. In this way names are passed from one generation to another. An important part of the boy's puberty ceremony is the ritual beating administered by the old men of the band. He is now permitted to take part in the singing and can be present when the sacred flutes are played in the flute hut. Although this creates an attitude of obedience to the older men, he still continues to be abusive toward the women of the band. His unmarried female cross cousins now begin to notice him and openly show their desire to go hunting with him.

The puberty ceremony for girls is much more elaborate. After a girl has her first menses her father builds a small hut in the center of the camp, in which the girl is secluded. She must remain in this hut day and night and is attended by her
[202] female relatives. The chief then calls all members of the band together, even sending messengers to distant hunting parties. When the band is united the chief organizes a hunt in which all the men take part, and they must remain away from the
[251] camp until the moon is full. While on the hunt they accumulate a great quantity of smoked meat. When the moon is full, the men send a messenger to the camp to whom the women give some of the

115
157 A1. --The chief of the group. He is a man of about 35 years, married to three women: a2, by whom he has a daughter a5, and a3 and a4, both daughters of "sister," without child.

A1 is remarkably intelligent, conscious of his responsibilities, active, enterprising and ingenious. When we went to visit his village, he did not hesitate to follow a new itinerary, unknown to him, because our horses could not pass along the habitual path. And when we arrived at the village, we found the stakes necessary to tie our oxen and horses, which he had had set up by a party sent a few hours ahead of time.

His attitude concerning writing is very revealing. He immediately understood his role of signing (1), and the social superiority which it

531
●212

1. The Nambikwara of group a are completely ignorant of drawing, if one excepts a few geometric tracings on gourds. For several days they did not know what to do with the paper and pencils which we distributed to them. A little later, we saw them deeply engrossed in tracing wavy lines. In doing this they were imitating the only use which they had seen us make of our note pads, that is, for writing, but without understanding the purpose and significance.

531
212

besides, they called the act of writing: inkatukendiare (a1), that is "make lines," which for them had an esthetic interest:

(2) Khihdigare mi[illegible]ase (b1).
It is nice to make lines.

[77] The drawings reproduced in Figure 19 thus constitute a cultural innovation inspired by our own drawings.

622 confers, also [41] he asked us for a note pad and a pencil, and we
115 are likewise equipped when we travel together. He does not com-
137 municate to me verbally the information that I ask of him, but traces on his paper some wavy lines and presents them to me as though I should read his response. But he himself is half duped by his comedy. Each time that his hand finishes a line, he examines it anxiously, as if the significance should miraculously spring forth, and each time, the same chagrined disillusion is painted on his face. But he doesn't give in. And it is silently understood between us that his scrawl possesses a meaning which I pretend to understand. Naturally, the verbal commentary follows almost immediately, and excuses me from having to demand some very necessary clarifications. When we discuss command, we shall return to certain aspects of this semi-mystification.

He is a valuable informant who understands the problems, perceives the difficulties, and is interested in the work; but his functions absorb him often, and he disappears for whole days on a hunting expedition, a survey of itinerary or a localization of ripe seed or fruit trees. On the other hand, his wives often call him to tender love games in which he lets himself be voluntarily involved.

In a general way, his attitude shows a logic, a continuity of purpose, very exceptional among the Nambikwara who are often unstable and temperamental. Placed in other conditions and with other means at his disposal, he might be a valuable organizer. And he is, after all, alone responsible for the destinies of his group, which he conducts with competence, although in a sometimes utopian spirit.

The f[illegible]r and the mother of A1 are dead. But his father's brother and mother's sister, whom he calls ahu'nosu and a?ienosu live in the same village (A65 and a66).

115 a2. --About 30 to 35 years. The eldest of the wives of A1, mother of a5, daughter of a18 and a now dead father. She is serious industrious, a little reserved in social relations. In the triple household

In other publications (2) we have brought up the question of

> 2. On dual organization in South America, América Indígena, Mexico, 1944. On certain structural similarities of the Chibcha and Nambikwara languages. Congrès International des Américanistes, Paris, 1947.

knowing if the type of life of the Nambikwara, apparently very primitive, does or does not constitute the authentic vestige of ancient conditions. Considered in the present, their level of culture is certainly very low. They live naked, especially the women, who only wear a thin string of buriti beads around the waist, some earrings, necklaces worn around the neck or looped over the shoulder, [14] bracelets made from the tail of the large armadillo, and, sometimes, some narrow bands of cotton woven by their husbands, or some buriti straw, tightly bound around the biceps, and wooden pins. Besides the same ornaments, the men sometimes put on a sort of straw pompom, fastened to the waist above the sex organs, and smaller ones, attached to cotton bracelets; on the other hand, they do not wear shell bracelets. The complete ignorance of the hammock and the Nambikwara custom of sleeping on the ground (or, more rarely, on long strips of the bark of the palm tree paxiuba) has intrigued ethnologists for a long time. This sentiment is shared by neighboring tribes, and the Parecí, mentioning this peculiarity, call the Nambikwara Halikoluré, "those who sleep on the ground."

The Nambikwara year must be divided into two distinct periods. During the rainy season (from October to March), each group settles on some small elevation rising above the course of some stream. The Indians then construct crude huts with curious variations in form and materials. They burn clearings in the approaches to the forests which occupy the humid valley floor, and there they plant and cultivate gardens principally with the starch-yielding plants of the manihot genus (sweet and bitter) and tobacco, sometimes some peas, cotton, peanuts, and calabash (Lagenaria sp.). They grate the yucca (manioc) on planks covered with the sharp bark of the palm tree, they press it with the aid of a piece of twisted bark. The garden produce furnishes food resources sufficient for part of the sedentary period, and even of use later: the Nambikwara preserve the yucca by burying the residue of the "grated" pulp in the ground.

At the arrival of the dry season, they abandon the village, or rather the site of temporary residence, and each group "breaks up," if one can say that, into several nomadic bands. For about seven

1: Lévi-Strauss--18 E-6 (1938-1939) 1948 SP 17 Nambikwara SP17

For about seven
223 months these bands go wandering across the prairie in search of small
[128] game, small animals such as caterpillars, spiders, grasshoppers,
rodents, snakes, lizards, and so forth, and fruits, grains, roots or
wild honey--in short, all that might keep them from dying of hunger.
Their camps, set up for one or several days, sometimes for several
weeks, consist of as many temporary shelters as families, made of
palms or branches stuck in a semi-circle in the sand and connected
at the top. This is the period when the quest for food absorbs all
activities. The women equip themselves with digging sticks and
221 the men hunt with the bow and arrow, of which several types must be
411 distinguished. The eastern groups have a bow with a flat section
184 which evolves toward a convex-plane section or a concave-convex
section when one moves westward. As for the arrows, those made
for hunting birds have a blunted tip. Arrows for fish have three to
five points, each one formed like a minute harpoon, and the stem
is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 98.

by a sheath of bamboo, are reserved for hunting monkeys and small
game. Those for large game have a long lanceolate point. The barb
is attached or sewed on. Besides the bow and arrow, the men use a club
[169] which often takes the form of a javelin, and its use is reserved for
magic and war operations (1).

1. Cf. below, p. 99.

224 The primary materials of the indigenous industry consist of varied
225 woods, wax from wild bees, resin, fibers of the buriti palm trees
(Mauritia vinifera) and tucum (Astrocaryum tucuma) bone of the
monkey, teeth and claws of mammals, fur (only to make ornaments),
feathers, quills of porcupines, vegetable shells and river shells, stones,
412 cotton and grains. As implements they have knives made from a sharp
piece of bamboo, from stones crudely fashioned, or from fragments
of iron or steel obtained through exchange, and fixed with the aid of
wax and cord between two pieces of wood forming the handle. Drills
are made of a borer of stone or iron mounted at the end of a stick
[17] which they turn between their palms. The Rondon Commission ex-
panded the use of axes and metal hammers, and the old stone axes
serve now only as small anvil blocks for fashioning shell or bone.
[415] The use of stone polishers must also be mentioned and, among the
objects of current usage, the spindles, combs, baskets and gourds to
carry water.

157
182

While they speak of the latter with the excitement, and the almost exalted tone, of discovery. Let us listen to an informant (81) describe the double cycle of the year:

First the sedentary life:

87. sedeṽãtage kasaadeŋ hĩjodige sedeṽãtkero, yatiĩ'kero 22/0
Tomorrow go hunting come back again 539
yatiĩ'nikero dãkero undãkero 157
cook again go to bed again sleep again 182

As is seen, the two forms of existence not are only very strikingly opposed from the economic and sociological point of view. They constitute two poles around which accumulate complex ensembles of emotions, sentiments and memories. With the same tenderness with which they caress their wives, the men evoke the type of life defined by the temporary shelter and the eternal basket, where the most incongruous means of subsistence are sparingly scraped, gathered together, caught each day, where one lives cruelly exposed to wind, cold and rain, and which leaves no more lasting trace than the souls of the women, dispersed by the wind and storms, on whose activity it essentially reposes. And almost like the reign of need is opposed to that of liberty, they conceive in a completely different aspect the sedentary life (whose specific and ancient character is still borne witness to the original species which they cultivate), but upon which the unchangeable chain of agricultural operations confers the same character of perpetuity as the reincarnated masculine souls, the durable house of winter time, and the cultivable land which will begin to live and to produce "when the death of its preceding cultivator shall be forgotten." (1) We do not think it possible to draw conclusions, from a work

1. Cf. quotation, p. 112.

having to do exclusively with several sociological and psychological aspects of the life of the Nambikwara, relative to the place one should assign them in the ensemble of South-American cultures. However, the preceding information suffices to show under what form the problem is posed. We are in [129] the presence of a culture which shows linguistic affinities with the Ŝiuŋa, and which approaches the Tupi from the double point of view of family organization and religious beliefs, at the same time recalling

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

Nambicuara (Roquette-Pinto's Uaintaya, which includes his *Kabishi*, *Tagaiteua*, *Tawaiti*, *Tarwaiti*, and *Tauhaiti*) between the Gaupore River Basin in the south and the Tenente Marques, Iki and Roosevelt Rivers in the north and northwest; *Western Nambicuara* (new), closely related to the central and southern groups and living on the headwaters and in the upper basin of the Roosevelt River; and *Northern Nambicuara* (new), speaking its own language and living north of the central group.

The Indians mention other tribes north of the *Nambicuara*; one called *Salumã*, *Sarumã*, or *Salamãi* is almost certainly the *Mondurucú*; another may be the *Tapuyuna*.

In 1907, Rondón estimated the total *Nambicuara* population to be 20,000. In 1912 Roquette-Pinto met 1,000 to 1,500. It is doubtful whether the total population, which has been decimated by several recent epidemics, now greatly exceeds 1,500.

The *Nambicuara* language was previously thought to be isolated, but its distinctive trait—the use of classificatory suffixes dividing the universe into about ten categories—is strongly reminiscent of *Chibcha*.

Nambicuara culture, although less primitive than that of the *Siriono* to the southwest, is strikingly simple in comparison with that of the neighboring *Parecis* to the southeast and of the *Tupi-Cawahib* to the northwest. Their lack of the hammock, their custom of sleeping on the ground, their crude ceramics (the *Eastern Nambicuara* entirely lack pottery), the nakedness of both sexes, their nomadism, their use of temporary shelters during most of the year, the general poverty of their material culture, and the simplicity of their social organization distinguish them from the higher cultures of the Gaupore River area, to which they nevertheless probably belong.

CULTURE

SUBSISTENCE

The *Nambicuara* habitat is a savannalike plateau about 500 to 1,500 feet (150 to 500 m.) above sea level with an arenaceous soil which comes from disintegrated sandstone bedrock. Except for narrow gallery forests along river banks, the region is infertile, having only shrubs and small trees with thorns or thick bark.

In this unproductive environment the *Nambicuara* have a dual subsistence pattern. They are both seminomadic bush dwellers and incipient farmers. During the dry season, women, accompanied by their children, forage with digging sticks for wild fruits, seeds, and roots, and catch grubs, rats, bats, spiders, snakes, lizards, and other small creatures, while men hunt what large game they can find with bows and arrows and collect wild honey.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

When rains come, the *Nambikwara* settle in temporary villages, and the men open circular gardens in the gallery forest by burning and felling the trees with stone (now steel) axes. They till the soil with pointed sticks and raise both bitter and sweet manioc, several kinds of maize which are different from those of their more civilized neighbors (Roquette-Pinto, 1938, p. 207 n.), beans, gourds, cotton, urucú and a variety of small tobacco with tiny leaves. Despite the difficulty of fishing in the deep, clear tributaries of the Juruena River, they have moderate success using fish arrows, basket traps, and a drug made of a vine.

Food preparation.—Game is usually only half cooked in hot ashes, but it is sometimes smoked on rectangular or pyramidal hairworks. Manioc is grated on thorns of the animal palm (*Iriartea* sp.) imbedded in palm wood planks. To remove the poisonous juice of bitter manioc, the pulp is either squeezed in a strip of bark twisted spirally or buried for several days to allow the juice to drain off. Balls of the pulp are then sun-dried and packed in leaves in baskets or buried at cached places. In times of scarcity, perhaps months later, the half-rotten balls are made into flat cakes, hastily cooked in hot ashes, and eaten.

The *Nambikwara* cannot bear to eat salt, which they do not know how to prepare, or pepper, which they do not cultivate. Even hot food is cooled with water before it is eaten. Wild honey, too, is diluted with water. The only condiment is a variety of cumaré bean which has a strong, bitter almond taste. It is boiled in pots; afterward the liquid is drunk and the beans are mixed with food, especially with grasshoppers crushed in mortars. Armadillo meat is often ground with maize flour.

Domestic animals and pets.—The *Nambikwara* have many pets, especially monkeys, coatis, parrots, and birds. Domesticated animals were unknown until the Rondón Commission introduced chickens and dogs. Although at first extremely afraid of dogs, the Indians quickly adopted them and treated them with the same deep affection they show all their tame animals. Even now they are terrified by cows seen at telegraph stations, and call them by the name given to the deadly spirits of the water and the bush. They do, however, hunt and eat horses and mules as if they were wild game.

HOUSES

The surprising variety of house types suggests recent borrowing from neighboring tribes. The *Nambikwara*, like the *Siwiond*, may formerly have lacked houses entirely. During most of the year, even at the present time, they build only scanty temporary shelters for a single night. These consist of branches of palms stuck into holes dug in the sand to form a half or quarter circle on the side from which the sun, the wind, or rain are expected (pl. 37, *center, left*). Each individual family builds its own

226 headwater streams. The deep clear streams make fishing with timbó difficult. Game in the forests and on the plain is scarce. Yet by exploiting all the resources of the area the Nambicuara are able to survive. In contrast to the other tribes reported in this monograph the Nambicuara have the broadest resource base, as the list of their resources in Appendix I indicates.

262

132 The Eastern Nambicuara occupy the high plateau between Utiarity and Vilhena. At Utiarity the altitude is 443 meters and at Vilhena 665 meters. The dry season extends from May to September. Except for occasional south winds, which bring a cold drizzling rain for a day or two, the season is clear, cool, and dry, the daily temperatures ranging from 68° to 85° F. During this

[131 148] period the grass withers, the livestock of the white men having to subsist on shrubs and what fodder the owners can provide. Horses and mules, particularly, suffer during these months. In August

132 221 [228] the Indians burn the dry grass so that with the first showers new grass can grow out and attract the deer, which the Indians can then hunt.

[305] The dry season, which the Nambicuara call *kwaldeiu*, is the most difficult. By the end of June they have consumed the manioc, maize, beans, and other crops which they have planted. During July and August they subsist on palm nuts, sumbaré beans, fruta de lobo, snakes, insects, fish, and whatever animals they can kill on the plateau or in the forest. The rainy season

305 (*wakisu*) is divided into periods depending upon

221 the fruits as they come into season. September is known as *yaldéwsu*, for during this period the people depend upon the jaboticaba fruit. October and November are called *pa'ensaljêsu*, for during these months the bacaba palm nut ripens. December and January are termed *ikwa*, or piqui time. February and March are known as *enaiwa*, which appears to cover a variety of berries and small fruits. April and May are termed *dzuqueljêsu*, as many fruits and nuts come into season, particularly, the cashew nut. During these months the garden crops also come in, giving the Nambicuara a short period of abundance.

SETTLEMENTS AND SHELTERS

361 Each of the four Eastern Nambicuara bands

621 has a defined area within which it hunts, fishes, collects, and grows its crops. These territories in-

½ [1:9:A fish poison - A.] [p. 87 (2)] ½ [See cat. 116, pp. 124-126. - Analyst]

252 placed on a platform under which a fire is lighted. In this manner large quantities of farinha can be prepared in one day.

When a woman gets ready to bake a manioc cake she pushes the hot coals and burning wood to one side and puts down the hot bed of the fire with a flat piece of wood. She then breaks off pieces from a dried manioc loaf and crumbles them over the bed of the fire by rubbing them in her hands. When she has crumbled up enough dry manioc, she pats down the flour to form a round, flat cake about 10 inches in diameter and from 1 to 2 inches in thickness. She covers the cake first with hot ashes and then hot coals. After one-half hour she uncovers her oven to find a brown cake covered with ashes and cinders. This sour, dirty, gritty product in no way compares with the fine-textured, sweet manpé of the Camayurá, the meal for which is prepared by crushing the dry loaf in a mortar, then sifted to remove the rough fibers, after which the flour is dampened and baked on a pottery baking plate. Sometimes the whole manioc loaf is placed in the fire, and as it burns the Nambicuara begin to break off pieces from the outside. For commercial purposes they bake cakes about 2 feet in diameter.

291 Toward the end of the rains in April and May the Nambicuara return to their fields to enjoy the fresh garden products. The harvest is inaugurated with a harvest ceremony (kalokaal-khatu). Fresh maize, peanuts, and sweetpotatoes are roasted, manioc cakes are prepared, and, if possible, manioc juice is boiled to make chicha. These garden products, along with meat, supply the food for the feast, which lasts for several days. [262] [252] [534] The sacred flutes (waiwiku) are played in the flute hut, the spirits of the ancestors are present, and food and drink are offered to them.

221 The subsistence activities of the Nambicuara are, thus, closely associated with the annual cycle of growth in which agriculture forms but a part. The dependence of the Nambicuara upon the wild products of the forest and plateau are much more complex than has been indicated. They supplied long lists of names of plants, insects, and animals for which no Portuguese names could be found. A full understanding of their economic dependence upon the environment would come only by someone following a band of Nambicuara throughout the year to observe the complete annual cycle of

4 Oberg E-3 (1949)1953
SP17 Nambicuara SP17

221 subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A favorite dish is to crush in a mortar manioc cakes with boiled beans, broiled meat, nuts, palm nuts, monkey and bird bones.

[262 252] As an example of the variety of uses to which the Nambicuara can put a plant we can take the buriti palm: (1) They eat the pulp surrounding the scaly covered nut. (2) They use the fibers from the new growth to make twine. (3) They use the tough, flexible center of the frond stalk for making baskets. (4) They fell the buriti so that a certain variety of grub can collect and multiply in the starchy pith in the heart of the tree. The grubs or larvae they then eat uncooked. (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buriti palm has male associations, for only men can prepare its products. When a male child dies a piece of buriti fiber is left over his grave.

372 The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 10 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick bounces into small smoldering balls. These he places into a handful of dry buriti fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

412 The material equipment of the Eastern Nambicuara is extremely simple. Many items, such
415 as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small grater and the few gourd vessels, small baskets, and twine, the woman carries

[p. 92(B)]

?; Roquette-Pinto--17 E-4,8 (no date) 1938 SP17 Nambicuara SP1"
(ca. 1912)

[6] The geographical range of the name "Nambicuara" is very significant; the term designates these Indians both in Mato Grosso and in Pará. This means that the inhabitants of the Serra do Norte are known by the same name to the north and to the south.

This might lead us to believe that the name is unusually distinctive. However, it is unknown to its bearers and altogether alien to the dialect of any of the groups. It is fitting nevertheless to retain it in order to avoid confusion.

[7] The southern boundary of the Nambicuara region is the Papagaio
[8] River.

In the north their territory apparently extends to the Gi-Paraná; in the east, to the Tapajoz; in the west, to the Guaporé.

The people who live near the banks of the Juruena and Juina, between the Papagaio and Camararé riven, [216] and whom I shall name the "southeastern group," are called "Cô[illegible]" or "Cô[illegible]."

Those who live along the lower reaches of the Dose de Outubro River are called "Anunsê"; I shall refer to them as the "northeastern group." They probably extend as far as the confluence of the Arinos Juruena rivers, where a few members of the first group are also likely to be found.

[illegible] Those who live to the southwest of the wintering place [invernada] at Campos Novos extend down to the Guaporé River; they are called "Uainrazê" and constitute the "southwestern group."

The great "northwestern group" lives near the Madeira River, on the banks of tributaries of the Gi-Paraná. It seems to consist of various secondary groups related in ways which have not yet been clearly defined. The Indians I encountered at the wintering place of Três Buritis, at the Campos de Quatorze de Abril, at José Bonifacio and at Campos de Maria de Molina all belong to this division. Their principal group lives between the Dose de Outubro and Roosevelt (Rio da Dúvida) rivers.

Of the northern division I found only the Tagnani, Tawite, Saluma, Tarute and Tashwite [Taschuitê]; and I only succeeded in gathering data on the first two.

For about seven
221 months these bands go wandering across the prairie in search of small
● [222] game, small animals such as caterpillars, spiders, grasshoppers, rodents, snakes, lizards, and so forth, and fruits, grains, roots or wild honey—in short, all that might keep them from dying of hunger. Their camps, set up for one or several days, sometimes for several weeks, consist of as many temporary shelters as families, made of palms or branches stuck in a semi-circle in the sand and connected at the top. This is the period when the quest for food absorbs all activities. The women equip themselves with digging sticks and
221 411 184 the men hunt with the bow and arrow, of which several types must be distinguished. The eastern groups have a bow with a flat section which evolves toward a convex-plane section or a concave-convex section when one moves westward. As for the arrows, those made for hunting birds have a blunted tip. Arrows for fish have three to five points, each one formed like a minute harpoon, and the stem is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 95.

by a sheath of bamboo, are reserved for hunting monkeys and small game. Those for large game have a long lanceolate point. The barb is attached or sewed on. Besides the bow and arrow, the men use a club
[189] which often takes the form of a javelin, and its use is reserved for magic and war operations (1).

1. Cf. below, p. 99.

824 The primary materials of the indigenous industry consist of varied
825 woods, wax from wild bees, resin, fibers of the buriti palm trees (Mauritia vinifera) and tucum (Astrocaryum tucuma) bone of the monkey, teeth and claws of mammals, fur (only to make ornaments), feathers, quills of porcupines, vegetable shells and river shells, stones,
412 cotton and grains. As implements they have knives made from a sharp piece of bamboo, from stones crudely fashioned, or from fragments of iron or steel obtained through exchange, and fixed with the aid of wax and cord between two pieces of wood forming the handle. Drills are made of a borer of stone or iron mounted at the end of a stick
[77] which they turn between their palms. The Rondon Commission expanded the use of axes and metal hammers, and the old stone axes serve now only as small anvil blocks for fashioning shell or bone.
[418] The use of stone polishers must also be mentioned and, among the objects of current usage, the spindles, combs, baskets and gourds to carry water.

622 and oxen for carrying could pass. The provisions of manioc proved to be insufficient and one morning the little band found itself without anything to eat. Our own attempts to kill some animal were in vain, and the worst [88] bad humor began to reign, the chief of the group being obviously held responsible for an affair which we, he and I, had contrived. In place of undertaking a hunting or collecting expedition, each one decided to go to sleep in the shade of shelters, and they left the chief alone to find the solution to the problem. He disappeared, accompanied by one of his wives (his first wife a2, contrary to usual procedure; but a3 and a4 shared the general irritation) and toward evening both were seen reappearing, their heavy baskets filled with grasshoppers which they had spent the entire day catching. Although grasshopper pie is not a particularly esteemed dish, everyone ate with good appetite and found his good humor again. They took up the journey again the next morning.

But other things than these exceptional relief measures are expected of the chief. He must sing and dance willingly and well, and be capable of animating the collective life. He must organize the work in the most reasonable way in order to eliminate useless fatigue and effort. Thus on the eve of a departure, B1 recites for us his order of march:

30. mãdotige mãdohadhudne hajtehãdige nãnjehnile
gietnonãnahara jãuehara kanahanĩndeere hinkãnaha
iinãamnje ãkeena iinamnje ihikoro ihikoro. (b1)
When it is hot, one is tired, one is hungry, the
children walk badly; when one marches at dawn,
one marches well, at dawn, one should march, change
routes, march; on the way! on the way!

He must also win over his companions by numerous gifts. According to B1, who gives in willingly to the servitude of power, generosity plays a fundamental role in determining the degree of popularity which the new chief will enjoy, and the companions indulge in all sorts of speculations:

31. uiliki abeni ãnire tunumẽntutnuiliki agnhãnare
iunũriani (b-1)
The chief is leaving; the one who will come will give me
a great deal.--"Chief! Be generous! Give to me!"

The presents thus anticipated consist of food or objects which the chief will have made himself with the assistance of his polygamous wives, or that he will have procured by good exchanges with neighboring bands, or which might come from war booty. Often, it seems,

796

alãgena hãjtige (b1)
to sing in the place.

534 A very strict taboo rests on the flageolets. Only the adult
784 men can play them:

46. ũĩtnore ũĩtnia imãgare.
Children do not know how to play the flageolet.

And the sight of the instruments is rigorously forbidden the women:

denaãtie iatiaeninĩnena ednaio iãneni (b1)
the women cannot see them, only the men see.

These flageolets are made in great secrecy, in the same place where they find suitable bamboo. If the musical expedition returns by day, they hide the flageolets in the branches of a tree not far from the camp or from the village. They only bring them out at night, at the moment of the concert, and the women must then retire to the huts or under the shelters, and hide their heads in
[688] their arms. If one of them violates the taboo, they claim she would be pursued by all the men and killed by blows of a stick. We did not have the chance to attend one of these festivals, but, as we desired to collect the musical repertory of the flageolets, we were able, with a certain amount of difficulty, to arrange it so that a mission was sent to find bamboo and make instruments for us (it was necessary to go about 15 kilometers). Having left in the morning, the group returned in the middle of the night, and until daylight we made music some distance from the camp in order to avoid all feminine indis-
[534] cretion. As each instrument sounds a little different from the others, the playing produces an illusion of harmony which is added to the charm of the melody, in itself very real.

534 It is possible that all the musical instruments of the Nambikwara
784 are connected to activities of an economic-social character. Some testimonials, a decisive confirmation of which I was not able to obtain, present the nasal flutes (arãtasu, a2) as meant to assure a rich harvest of the fruit piquy. The season of piquy, which grows in
● [222] abundance in the plains, is actually an impatiently awaited period for the Indians. The fruit is admiringly weighed and said to have "lots of fat." Likewise the flutes of Pan (asinzu, a1; inauzere, b1) would be employed in the rites preceding hunting expeditions. In
[192] the case of nasal flutes, a double analogy has been pointed out by certain informants between their form and that [106] of the pit of the piquy, and between their name and the name of the piquy (ahãru, a 1/2). The latter analogy exists only in the eastern dialect

SP17 Nambicuara SP17

101 197 *Nambicuara* (Roquette-Pinto's *Uaintaçu*, which includes his *Kabishi*, *Tagnani*, *Tauitê*, *Tarutê*, and *Tashuitê*) between the Guaporé River Basin in the south and the Tenente Marqués, Iké and Roosevelt Rivers in the north and northwest; *Western Nambicuara* (new), closely related to the central and southern groups and living on the headwaters and in the upper basin of the Roosevelt River; and *Northern Nambicuara* (new), speaking its own language and living north of the central group.

101 The Indians mention other tribes north of the *Nambicuara;* one called *Saluma*, *Saruma*, or *Solondé* is almost certainly the *Mundurucú;* another may be the *Tapanyuna*.

161 In 1907, Rondón estimated the total *Nambicuara* population to be 20,000. In 1912 Roquette-Pinto met 1,000 to 1,500. It is doubtful whether the total population, which has been decimated by several recent epidemics, now greatly exceeds 1,500.

197 193 The *Nambicuara* language was previously thought to be isolated, but its distinctive trait—the use of classificatory suffixes dividing the universe into about ten categories—is strongly reminiscent of *Chibcha*.

101 *Nambicuara* culture, although less primitive than that of the *Sirionó* to the southwest, is strikingly simple in comparison with that of the neighboring *Paressí* to the southeast and of the *Tupi-Cawahib* to the northwest. Their lack of the hammock, their custom of sleeping on the ground, their crude ceramics (the *Eastern Nambicuara* entirely lack pottery), the nakedness of both sexes, their nomadism, their use of temporary shelters during most of the year, the general poverty of their material culture, and the simplicity of their social organization distinguish them from the higher cultures of the Guaporé River area, to which they nevertheless probably belong.

CULTURE

SUBSISTENCE

133 134 137 The *Nambicuara* habitat is a savannalike plateau about 500 to 1,500 feet (150 to 500 m.) above sea level with an arenaceous soil which comes from disintegrated sandstone bedrock. Except for narrow gallery forests along river banks, the region is infertile, having only shrubs and small trees with thorns or thick bark.

221 In this unproductive environment the *Nambicuara* have a dual subsistence pattern. They are both seminomadic bush dwellers and incipient farmers. During the dry season, women, accompanied by their children, [224 222] forage with digging sticks for wild fruits, seeds, and roots, and catch grubs, rats, bats, spiders, snakes, lizards, and other small creatures, while men hunt what large game they can find with bows and arrows and collect wild honey.

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

Gardening exists only during the rainy season and does not free the Nambikuara from wandering during the seven months of the dry season, looking for wild roots, fruits and seeds, small animals such as lizards, snakes, bats, spiders and grasshoppers and, generally speaking, anything which may prevent them from starving. As a matter of fact, their geographical surroundings, which are located in the northwestern part of the state of Mato Grosso and include the headwaters of the Tapajos, Rio Roosevelt and Rio Gi-Parana, consist of a desolated savanna with few vegetal resources and still less game.

Had I approached my subject from a point of view other than the one outlined above, I could not have avoided a long discussion in South American cultural history, aimed at clearing up this apparent primitiveness, on the question as to whether the survival of early conditions of life in South America is genuine or whether we should consider it as a more recent—although undoubtedly pre-columbian—result of culture clashes and processes of acculturation. Whatever the answer may be, it cannot substantially change our problem: whether tarriant or recessive, the Nambikuara society functions, in the present, as one of the simplest forms of human society to be conceived. We shall not seek information from the particular history which kept them in their exceptionally crude organisation or brought them back to it. We shall only look at the experiment in social anthropology which they now enact under our very eyes.

This holds especially true in respect to their social and political life. For if we do not know what was the material culture of the Nambikuara forty years ago (they were discovered only in 1907), we do know that their numbers became tremendously reduced after their contact with white civilization. General (then Colonel) Candido Mariano da Silva Rondon, who discovered and studied them, first stated that their number was about 20,000. This was around 1915. I take this figure as greatly exaggerated, but even if reduced by one half, it considerably exceeds the present number which is hardly more than 2,000. Epidemics have taken care of the difference. What does this mean, from the point of view of our study? During the dry season, the Nambikuara live in nomadic bands, each one under the leadership of a chief, who, during the sedentary life of the rainy months, may be either a village chief or a person of position. General Rondon wrote that, at the time he was exploring the country, it was not rare to see bands averaging two or three hundred individuals. Now, sixty or seventy

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

Vilhena. These Indian Posts have had only limited success in attracting the Nambicuara, because the region is agriculturally so poor that it is difficult to grow enough food to maintain a settled population, and at present the Indians only visit these posts occasionally.

Intensive missionary activity among the Nambicuara began when two American Protestant missionaries, Arthur F. Tylee and William R. Henricks, established a mission station at Juruena in 1925. In October 1930, the Reverend Mr. Tylee, his baby daughter, Miss Mildred Kratz (nurse), and three Brazilians employed by the mission were killed by the Nambicuara belonging to Julio's band. Mrs. Tylee, although struck three or four times on the head while rushing to her child who was still in bed, was only stunned and came to after the Indians had left. One Brazilian hired man escaped to get help from the telegraph station. Some years later new Protestant missions were established at Campos Novos (Nambicuaras) and at Utiarity. At present only the mission station at Utiarity is in operation.

The Jesuits established a mission at Juruena about 1930, but in 1940 moved it to its present site in Utiarity. Today both the Protestant and Catholic missions are, therefore, located in Utiarity, which not only is connected by truck road to Cuiabá but is also centrally located. To the east and south are the remnants of the Paressí, and to the north, the Iranxe, who, although not speaking the Paressí language, appear to belong to the Arawak-speaking family. Further northward are tribes with which the missionaries are planning to make contacts. To the west are the Nambicuara. Although officially on friendly terms there is considerable tension between the Protestant and Catholic missionaries, as they are competing for the allegiance of the same Indian population.

ECONOMY

Although the Nambicuara practice a shifting agriculture, their dependence upon the wild animal and plant life of the region is so extensive that they might well be classed as nomadic hunters and collectors. The semiarid plateau provides little in the way of agricultural land, game, or fish. What little farming is practiced is carried on in the narrow "galeria" forests of the headwater streams.

[p. 87 (1)]

The Wakitisu do not
323 make pottery, but they sometimes acquire pots from the Paresi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakitisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[482 and carrying a burden basket on her back and a
854] baby strapped on her hip, an older child following her. As they move slowly along they collect
222 fruits, nuts, insects, snakes, ants, lizards, rats, wild honey, and a great variety of grubs or larvae.
226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262] These were later thrown on hot coals and eaten without being cleaned. Small birds no larger
223 than a sparrow are shot if the man can get near
222 enough to use his bow and arrow. If they come
[314] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

241 but the method of felling is the same. All clearing has to be completed by the end of June to permit the felled trees to dry.

In late August, when the cicada begins to sing and the first thunder is heard, the Nambicuara return to undertake their planting activities. At a given signal, men with lighted bunches of dry grass set fire to dry trees and bushes all around the edges of the field. The rest of the people are concentrated at the river's edge at the bottom of the slope, and as animals, such as rats, lizards, and snakes, flee toward the water they kill them. ●[222] After the fires have died down the people go through the field collecting grubs, insects, and whatever else that is edible.

Among the stumps and unburnt logs the Nambicuara hoe up hills about 3 feet in diameter into which they stick 6 or 7 pieces of last season's manioc stems, each about 10 inches long. These hills are made about 5 or 6 feet apart. Formerly they used a digging stick (*kadikdáru*) but today the metal hoe (*iɔakúlusu*) is used. Bitter manioc (*wulídnsu*) is their most important crop.

After the rains have begun and the manioc is several inches high, they begin to plant maize (*kaydtsu*) of which the Nambicuara have several varieties. Maize is planted between the manioc hills by making a hole in the ground with a digging stick into which 2 seeds are dropped. As the holes are about 6 inches deep, the seeds are not covered. Whether this is to protect the seeds from birds is not clear.

When the maize has grown tall enough to provide shade they plant beans (*kaɔ́'su*), sweetpotatoes (*wísu*), and tobacco (*ítsu*). The bean which the Nambicuara grow looks like a large red kidney bean and has a tough skin. Beans are planted one seed to a shallow hole and covered. Sweetpotatoes are planted by placing cuttings in shallow trenches near logs and stumps. When 249 planting tobacco a man places a handful of seeds on a leaf, climbs onto a high stump, and blows the fine seeds so that they scatter over the field. They weed the field only once when the maize is 248 about a foot or two in height. Cotton is planted in the field but urucú bushes and gourds are planted near the houses. After the planting is finished and the field is growing well the people leave on their continuous rounds of hunting, fishing, and collecting.

[p. 91 (A)]

342 The external layers cover the whole building, like very precise and well clipped sheets of straw. The side walls are not distinct from the roof, but mere extensions of it.

Of the two houses we have described, in the village close to the Carumi (or Festa da Bandeira) River, the larger covers 30 meters in circumference, the other 28. Their doorways measure 0.37 meters in width by 0.52 meters in height. These two houses stand on a plaza some twenty meters in diameter.

352 Inside the huts stand three bamboo grids [giraus] to dry manioc
354 scrapings, and two enormous black pots which could not have come
[352] through the doors; lighter utensils and various other implements, as well as ornaments, are kept in the ceiling thatch. This serves as the Indians' closet, where they hide their smaller belongings. [Fig. 24]

354 A small fire burns underneath each grid.

These grids were made up of four bamboo stalks sunk into the ground and supporting a horizontal grate of small bamboo reeds. They measured about two meters in length by one and a half in width.

The huts are not equipped with any smoke holes, and none are needed. The smoke of inside fires filters easily through the interstices of the thatch.

356 Around the dwelling, scattered or in heaps, lie disjointed bones, fragmented coconuts, pods of the jatobá bean, corn cobs, charcoal, and food refuse, mixed with worn-out tools and utensils.

412 In the village on the Festa da Bandeira River, I found beside a house a large object which I only failed to bring back because it would have been absolutely impossible to transport it. It was of a kind commonly found in the sambaquis [224] of the Atlantic coast: a rock pitted with several depressions large enough to hold a fingertip. To
[222 one side lay a prodigious quantity of small bacaba nuts, both shelled
262] and unshelled. It has often been inferred that this implement was used to produce fires, but in the Serra do Norte it merely serves to shell palm nuts. This stone, however, was much larger than those generally encountered in the sambaquis.

342 The temporary shelter consists of a screen of leaves and branches. The Indians may use it for a few days if hunting in the area is good; then they abandon it.

The Wakitisu do not
323 make pottery, but they sometimes acquire pots from the Paresi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakitisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[482 and carrying a burden basket on her back and a
85 baby strapped on her hip, an older child following
222 her. As they move slowly along they collect fruits, nuts, insects, snakes, ants, lizards, rats,
226 wild honey, and a great variety of grubs or larvae. When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262 These were later thrown on hot coals and eaten without being cleaned. Small birds no larger
223 than a sparrow are shot if the man can get near
222 enough to use his bow and arrow. If they come
[314] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[197] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

224 to me not to say anything. Later that day he
264 returned to the spot, built a fire, roasted the snake,
and ate it by himself.

224 Caymans are hunted by first finding their hide-outs under logs or overhanging banks. When one is found under an overhanging bank the hunters peel a number of slender poles and begin to thrust them down through the bank to force the cayman out. Men are stationed above and below the spot, and as the cayman comes out he is shot. When he hides under logs the hunters feel for him with their feet. The hunters are so nimble that few of them get bitten. The large rodent, paca, is also hunted in this way, for it hides in holes under overhanging banks.

The large water snake, anaconda, is hunted in pools where it lies in wait for game. When the hunters have trailed an anaconda to a water hole they keep shooting arrows into the water until they strike it. The first strike then indicates where the snake is, and they continue shooting until the snake weakens and can be pulled out. Sometimes the snake grabs a hunter by the arm, but the others are there to assist if anyone gets into difficulties.

Small anteaters are dug out of holes but the larger kind which does not go into holes is hunted by two men armed with clubs. The men chase it, one on each side, and as the anteater turns on one he strikes it on the nose with his club and then jumps into a tree. The other hunter then strikes it. This continues until the anteater dies.

Monkeys are chased from tree to tree until they tire and come down to hide in a hole in the ground. Dogs can then overtake the monkey or he can be shot or dug out of the hole. Deer usually do not fall when shot, but the hunter chases the wounded deer until he can shoot more arrows into it, especially into the legs.

[278
184] Although the Western Nambicuara are said to use arrows poisoned with curare, the Wakitisu say they do not use curare but that they know how to prepare it and that they formerly used it in raids. As arrows do not penetrate bone, the hunter tries to shoot at an angle so that the arrow will enter the chest cavity, or he will aim between the neck and the shoulder bone.

● 223 The Nambicuara hunt and eat all birds except the urubú. Large rheas are not hunted because it is difficult to approach them on the open sa-

223 vanna, but they hunt for rhea eggs and the young birds.

224 When hunting caymans they do not use the word "cayman," nor will they take their eggs for fear of angering the mother cayman. After [535] a jaguar or tapir is killed the hunters sing and dance the following night.

Every group hunt has a hunt leader who is an experienced man. He tells each man exactly what he is to do. Hunting such animals as peccary, tapir, and jaguar demands careful teamwork. If the band splits up to hunt, the band chief will appoint the hunt leaders. If any man disobeys the hunt leader he will take the man's bow away from him and send him back to camp where he has to listen to the ridicule of the women. This is considered a great humiliation and happens only seldom and then to youths who are, as yet, inexperienced and overanxious to make a kill.

226 As the Nambicuara hunt along the banks of the rivers they are always ready to shoot any fish that happens to come near the bank. Sometimes they stand in one spot for hours waiting for pacú or matrinchã to pass near the bank. Certain berries which the fish like to eat are often thrown into the water to bring fish to the surface. At other times they tie a piece of broiled meat onto a stick and push the stick into the bottom. A man then stands on the bank, sucks air through his cupped hand, and as he lets the air out with a grunt he motions with his hand as if beckoning the fish to come near. This appears to be a magical act, for the Nambicuara claim that the fish understand the call. Sometimes they even talk to the fish saying that they have brought fat meat for them.

[824] Timbó fishing is practiced in the shallow cut-offs of the main streams. First the pond is dammed off, then bundles of timbó vine (*kéats*) are thrown into the shallow water and beaten with sticks until the vines are crushed, the bundles are then doused in the deeper water. As the fish in the ponds are very small, they are scooped up with baskets, either the cylindrical burden baskets or a shallow square basket. They also use a conical trap made on the spot from a few sticks which they thrust into the weeds where the fish are hiding. When they have finished with this trap (*tendru*) it is thrown away. Compared with the efficient equipment and methods in the Upper

411 (1) The *hápsaru*, an arrow which is used for shooting monkeys and large birds, is made by lashing an inch-long slender barb of siriva palm or piuva about an inch back from the sharpened point of the foreshaft.

[223 224]

[227] (2) The *saláiru*, or fish arrow, is made by lashing four slender points of wood about 2 inches long to the end of the foreshaft. This arrow need not be feathered. Today wire is sometimes substituted for the wooden points.

[223] (3) The *dánkiru*, or blunt bird arrow, used for shooting small birds, has a separate piuva foreshaft, the end of which forms a rounded flat surface about an inch in diameter.

[224] (4) The *hápiru*, or big game arrow, has a broad split bamboo point about 12 inches in length which is lashed to the foreshaft. As the bamboo point is slightly grooved along the center, the foreshaft lies along the groove permitting it to be lashed firmly to the tapered sides of the point. Formerly curare poison was smeared along the groove. This was also the arrow used in war.

Sometimes a bamboo point is serrated on one or both sides. In former times, this arrowhead was poisoned with curare. It was attached loosely to the shaft so that when it struck an animal it became detached from the shaft. This arrow was used against big game like the jaguar, tapir, deer, and against human enemies.

The bow is held in a vertical position when shooting; the arrow is held with the thumb and forefinger while the middle and ring finger pull the bowstring, with the arrow resting against the hand side of the bow.

283 Cordage is made from the fibers of the tucum and buriti palms and from cotton. The tucum palm (*Astrocaryum tucuma*), *kaitáru*, provides not

[306] only fiber but the hard shell of the nut is used for making the black, round, flat necklace washers,

[252] and the thorns from the trunk are used as spikes in the manioc grater. Tucum twine which is a little stronger than buriti twine is used for bowstrings, for stringing beads, and for many other purposes. When a man needs tucum twine he sends his wife to gather the palm leaves. As the young trees grow in clumps, it is a simple matter for the woman to cut off a number of fronds. The woman then takes a long slender leaf, bends it double in the middle so that the woody fiber breaks, then doubles it back and pulls downward

000 [245] The Tagnani also use a kind of fish trap.

[411] A rare type of blunt arrow is designed for the capture of birds
223 which serve as playmates to Nambicuara children.

The birds are felled by the impact and caught easily. Some
231 become used to their cruel captivity; a woodpecker (Colaptes
[225] campestris, Vieil) was occasionally imprisoned by a boy under a gourd. No sooner did the child remove the cup than the bird, instead of flying away, would perch upon him. It is true that the Indian nourishes his domesticated birds very well: he constantly feeds them from his own mouth, gently gorging them.

[Fig. 59]

To our intense surprise, as the cephalic measurements of an Anmize woman were being taken, a baby rat fell from the nape of her neck where it had apparently been living cozily, hiding in her hair as in the grass where it was born.

[225] Doves (Chamepelius talpacoti), young vultures (Sarcoramphus papa, Catharista atratus brasiliensis, Bonap), monkeys and small owls are also domesticated in the Serra do Norte.

Before the days of the Rondon Commission, the Nambicuara were not familiar with the ox, the mule or the dog. They are still afraid of the ox because of its horns; they have a liking for the donkey, whose meat they find similar to that of the tapir.

[246] They are now good friends of the dog, which at first frightened them greatly; they steal a few whenever they can, and these dogs quickly take a fancy to [the Indians] because they are so well fed. In the master's eating gourd there is always room for the dog's muzzle.

855 They carry their children in a strap slung over the shoulder and across the chest, which the Cocozu make with straw and the others with cotton.

484 They take along everything they own on the shortest excursions; this is a nomadic habit surviving among a nearly sedentary people.

241 A population as large as that of the Serra do Norte would be unable to subsist exclusively on hunting and fishing. The Indians would be forced to travel far and wide in search of food; they would have been annihilated long ago, or else deprived of those characteristics which only their isolation could maintain.

/216 cont./

224 278 411 [303] The poisoned arrows are intended for hunting certain animals, some large birds, cervids, and especially monkeys.

Birds wounded by one of these arrows fall almost immediately.

A monkey mortally wounded with an ordinary arrow or even a bullet often remains hanging from the branches. Under the action of curare it holds itself immobile at first, then begins to tremble and falls several minutes later (five to 10 at the most) as soon as paralysis is produced.

A peccary or small deer such as the Cervus campestris wounded in the body runs for one or two minutes, then stops exhausted, is attacked by tremors and lies down.

The tapir, very large, resists a long time; it can run for two hours before stopping; hence the Indians do not hunt it with curare.

[262] [262] /217/ The meat of animals killed with curare may be eaten without harm; the Ñambikwara of the Juruena content themselves with cutting away the flesh around the wound impregnated with poison and colored yellow; the Çabanè do not even take this precaution.

278 411 726 Poisoned arrows are also used for war; this is perhaps their principal object among many Ñambikwara groups, who possess only a very few specimens during normal times.

None of the Indians know of an efficacious antidote. According to our informants wounds in the trunk would always be fatal to men. By immediately drawing out the arrow, it might be possible to survive a wound in a limb; in order to make their extraction more difficult, the points of the poisoned arrows, especially those of the Çabanè, are very lightly attached to their shafts.

857 b5, who insists that the treatment that one gives the small ani-
609 mal to divest it of its hair be applied to the ethnologist:

21. nẽ inyenãghẽẽ nẽ?unẽẽguedne (b1)

Put his beard in the fire! Roast his beard!

857 In general, they are to be good companions, enthusiastic, and
157 untiringly avid for games that are shown them. In exchange, they are very obliging informants once they have become friends. Al-
[55] most all the information which we were able to gather concerning proper names comes from them.[1]

231 This chapter cannot be ended without presenting some observations relating to domestic animals. Not only do the children actually live in very intimate relationships with the animals, but the latter are treated in the family like real children at least outwardly. We mean that they share the group's food, benefit from the same manifestations of tenderness or interest—delousing, games, conversation, caresses—as the human beings. In everything, their treatment is [73] curiously the same. The Nambikwara have numerous domestic animals, first of all dogs, and cocks and hens, who are all descendants of those introduced in their region by the Rondon Commission; monkeys, parakeets, birds of various kinds, and finally, the caetetu, the coati (Nasua sp.), the jaguatirica. Only the dog seems to have acquired an
• [229] occasionally utilitarian role in the service of women, for hunting with the digging stick (cf. quotation No. 16). The men never use them for hunting with bow and arrow. The other ani-
231 mals are raised for the purpose of pleasure. They are not eaten,
262 the people do not consume the eggs of the hens who lay them in the bush. But they do not hesitate to devour a young bird if it dies after a vain attempt at acclimatization.

The terms used for behavior regarding animals are the same as those used for humans. They say dehẽna u'tte u'kwage, "the woman caresses the baby," or ũinũette u'kwage, "the woman caresses the puppy."

231 While traveling, except for the animals capable of walking,
482 the whole menagerie is packed with the other baggage. The monkeys, attached to the women's hair, adorn them with an amusing living helmet, elongated by the long tail curled around the neck of the bearer. The parakeets and hens perch on top of the baskets, other animals are held in the arms. None of them receive abundant nourishment but, even in days of need, they
231 521 have their share, however little it may be. As compensation, they are an endless subject of distraction for the group, the

1 [ie. From the children.--Analyst]

603 611 On the other hand, grandparents behave toward their descendants so as to show the permanence of the filial line. a14 takes special care of her granddaughters (daughter's daughters), orphaned by the mother, a8 and a9. She feeds them, bathes them, and the baby spends her days near her, and often the nights. When the group travels, she is the one who carries her when she can no longer walk. But above all, when a piece of game has been brought in by a hunter, one sees in the choice of beneficiaries, outlined in the heart of the group, the limits of a unit greater than the conjugal family, and whose reality appears only rarely in daily circumstances.

224 602 Thus, when a boa sucuri (irɨtasu, a1: Eunectes murinus) has been brought in one day by A17, he gives the tripe to his daughter a19, who passes it on to her sister a22; the latter divides it between a12 and a5 (her "daughters") and reserves a portion for herself; at the same time A17 cuts the body into portions which he gives to A13, A1, A21, and of which he keeps part. Here, the division is almost coextensive with the restricted group. But, in more serious circumstances (1), the division of

1. P. 106 sq., cessation of menses (état de marge).

an irara (inihɨnuklesu, a1: Mustela sp.) by A21 gives rise to the following distributions:

A quarter to a18 (wife's mother);
A quarter to a2 (wife's elder sister);
A quarter to a14 (brother's wife);
A foot to a19 (wife's younger sister);
A half-head to A17 (wife's mother's husband).

[75] He consumes the rest with his wife and baby, and the beneficiaries divide their share with spouse and children. Thus in the heart of the group there is outlined an even more restricted unit:

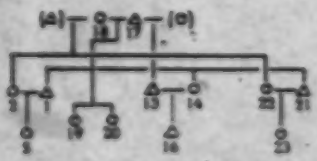

Fig. 17.

224 602 that of the members of a same bilateral family. Likewise, in the pounding of manioc, a2, a14, a18, a22 often work together and prepare a collective mass which will be divided among the same families, and will serve as food for the same persons as those represented in the above chart.

602 603 157 We do not know whether to attribute certain striking behavior of A17 to his classificatory position or to his individual characteristics. He is very clearly conscious of his almost patriarchal position in the midst of the group and of the fact that all the members, or almost all, are as regards him: asuittu, asuittu, tauêttu, tauêttu, tauêttu; he dwells on it, complacently enumerating the terms with grand gestures. He is gay, jovial and finds evident satisfaction in conversation about erotic subjects, contributions to which he enhances by mimicry and appropriate contortions. Within the group, in whose activities he shares only partially, he holds no authority, explicit or implicit.

RELATIVES AND ALLIED INDIVIDUALS
OR
COLLATERALS AND RELATIVES BY MARRIAGE

602 606 There is no apparent difference between the behavior of an individual as regards his spouse's parents and his behavior as regards his own parents. That is, from the point of view of individual relationships, the order of generations takes precedence over that of degrees. Parents-in-law, parents of the third degree, are concretely classed in the second generation ("fathers" and "mothers"). The same can be said for relationships of the wife's father and mother, or of the husband's, with the spouse of these latter. No special prohibition could be noted.

607 605 Sisters-in-law (aseêtasu, a1; ndêdere, b1) enjoy very free contacts among themselves. They laugh, joke together, do one another small services such as that of mutually rubbing the back with the tincture of urucu (Bixa orellana). However, one is in the presence of completely exceptional relationships [76] when one passes on to brothers-in-law (astikosu, a1; tartire, b1), or more exactly (since the name astikosu does not arise from marriage with the sister but is previous to it) to cross-cousins (masc.).

THEORY OF DEATH

761 775 [100] Death distinguishes between men on one hand, women and children on the other. When they die, the former are transformed into jaguars who represent, consequently, so many reincarnated humans. The women and children, on the other hand, disappear with the wind and the storm and are not susceptible to any reappearance.

40. dend̃ dũrige uetnatũrina ednadure lukuĩndige ndakuĩndige monãnkiadukuĩndige dend̃ dũrige monãure lĩttige amonotlĩttige tonodũrige uitendige (b1)
The woman and child who die do not change into beasts. The man who dies is changed into a jaguar, the woman who dies goes away with the tempest disappears with the storm.

262 Whence, among the Nambikwara, the only perfectly clear prohibition concerning food. Theoretically several exist, broken each time that the occasion is presented, such as those concerning the hawk, the worms from the bacaiuva nuts, and there may be added a probable repugnance concerning the meat of the veado (Cervus sp.). Chickens and dogs are never eaten, but their introduction is recent. 224 281 714 On the other hand, the jaguar can be hunted and killed, and its remains are highly regarded since the hide is used to make the fur bonnets worn in the attire of war; but it is not eaten under any pretext:

41. [following preceding text] loukuĩndige inkara uĩrige lotatũrige ikuitãdige uĩrige (b1)
775 [the dead man] becomes a jaguar, another eats him, the jaguar carries him off, he is left to another in order to eat him.

This theory complements the information collected in the eastern group more than it differs from it. The jaguar in fact plays the same role as the atãsu, it also carries off the dying. But the central theory adds a complement. This is that the deceased is identified with the animal, who thus becomes a supernatural being. It was not possible to find out if the atãsu which one meets at night are considered to be the souls of reincarnated dead people. (1)

776 171 -1. One recognizes in the man-eating jaguar gifted with a supernatural nature a typically Tupi theme, although its present diffusion is much greater. See concerning this subject, Métraux, loc. cit., passim.

846 them between herself and the baby. For the first time, she ex-
252 changes some words with her neighbors while laughing.

846 In the meantime, A21 has cleaned the irara. He gives the
252 stomach, the large intestine, the small intestine to a2 (wife's sister);
●224 she, aided by her daughter a5, cleans the intestines, puts them on to cook and begins to eat them with a5 and a3.

A21 cuts the tail of the irara, cooks it rapidly, and eats it with his wife and baby.

The three bats have been given to a2 (wife's sister) and a14 (sister), who divides her lot with her son A16 and her son-in-law A15. a22 cooks the lizards and the organs (liver, heart, lungs, spleen, kidneys of the irara). She gives the whole thing to her husband, who gives a piece of liver to the baby and divides the rest with his wife.

All of these operations are carried out very rapidly in a sort of hurry, and are finished at the end of a half-hour. At 30 minutes past 15 o'clock, a22 lights a different fire from the one that each household uses, and places the irara there. She then goes to take her first bath in the river, and brings back some water in a gourd to wash the baby. Toward 16:15 the cooked irara is taken from the fire by A21. At this moment everyone has returned to camp and has taken his habitual place. A21 and a22, seated near the new fire, occupy a central position. A21 cuts the irara into five pieces and divides it among the members of the family, as was said previously. (1)

1. Cf. above, p. 74 f.

From that time on, A21 and a22 take up normal activity and are no longer distinguished from their companions.

846 Thus the period of abstinence is characterized by relative isolation of the couple in question, which is at the same time under a certain number of taboos (social contacts, baths, preparation of food, dress, eating of certain foods). It ends at the moment when the child takes its first meal not consisting solely of milk (in this
[224 case the lizard eggs and the irara liver. This meal is part of a hunting
842] feast offered to the group by the parents who up to now were under the taboo. However, the atmosphere in which these operations are carried out merits attention. No solemnity surrounds them, and the parties concerned perform them with the same routine and nonchalance which characterizes daily activities. It is not a question then of a ceremony with the psychological implications which this term carries, but of a collection of acts which must be done, and are done, with a minimum of attention accorded to their exceptional character.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

101 197 *Nambicuara* (Roquette-Pinto's *Uaintaçu*, which includes his *Kabishi*, *Tagnani*, *Tauitê*, *Tarutê*, and *Tashuitê*) between the Guaporé River Basin in the south and the Tenente Marqués, Iké and Roosevelt Rivers in the north and northwest; *Western Nambicuara* (new), closely related to the central and southern groups and living on the headwaters and in the upper basin of the Roosevelt River; and *Northern Nambicuara* (new), speaking its own language and living north of the central group.

101 The Indians mention other tribes north of the *Nambicuara;* one called *Saluma, Saruma,* or *Solondé* is almost certainly the *Mundurucú;* another may be the *Tapanyuma.*

161 In 1907, Rondón estimated the total *Nambicuara* population to be 20,000. In 1912 Roquette-Pinto met 1,000 to 1,500. It is doubtful whether the total population, which has been decimated by several recent epidemics, now greatly exceeds 1,500.

197 193 The *Nambicuara* language was previously thought to be isolated, but its distinctive trait—the use of classificatory suffixes dividing the universe into about ten categories—is strongly reminiscent of *Chibcha.*

101 *Nambicuara* culture, although less primitive than that of the *Sirionó* to the southwest, is strikingly simple in comparison with that of the neighboring *Paressí* to the southeast and of the *Tupi-Cawahíb* to the northwest. Their lack of the hammock, their custom of sleeping on the ground, their crude ceramics (the *Eastern Nambicuara* entirely lack pottery), the nakedness of both sexes, their nomadism, their use of temporary shelters during most of the year, the general poverty of their material culture, and the simplicity of their social organization distinguish them from the higher cultures of the Guaporé River area, to which they nevertheless probably belong.

CULTURE

SUBSISTENCE

133 134 137 The *Nambicuara* habitat is a savannalike plateau about 500 to 1,500 feet (150 to 500 m.) above sea level with an arenaceous soil which comes from disintegrated sandstone bedrock. Except for narrow gallery forests along river banks, the region is infertile, having only shrubs and small trees with thorns or thick bark.

221 In this unproductive environment the *Nambicuara* have a dual subsistence pattern. They are both seminomadic bush dwellers and incipient farmers. During the dry season, women, accompanied by their children, [224 222] forage with digging sticks for wild fruits, seeds, and roots, and catch grubs, rats, bats, spiders, snakes, lizards, and other small creatures, while men hunt what large game they can find with bows and arrows and collect wild honey.

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

Vilhena. These Indian Posts have had only limited success in attracting the Nambicuara, because the region is agriculturally so poor that it is difficult to grow enough food to maintain a settled population, and at present the Indians only visit these posts occasionally.

Intensive missionary activity among the Nambicuara began when two American Protestant missionaries, Arthur F. Tylee and William R. Henricks, established a mission station at Juruena in 1925. In October 1930, the Reverend Mr. Tylee, his baby daughter, Miss Mildred Kratz (nurse), and three Brazilians employed by the mission were killed by the Nambicuara belonging to Julio's band. Mrs. Tylee, although struck three or four times on the head while rushing to her child who was still in bed, was only stunned and came to after the Indians had left. One Brazilian hired man escaped to get help from the telegraph station. Some years later new Protestant missions were established at Campos Novos (Nambicuaras) and at Utiarity. At present only the mission station at Utiarity is in operation.

The Jesuits established a mission at Juruena about 1930, but in 1940 moved it to its present site in Utiarity. Today both the Protestant and Catholic missions are, therefore, located in Utiarity, which not only is connected by truck road to Cuiabá but is also centrally located. To the east and south are the remnants of the Paressí, and to the north, the Iranxe, who, although not speaking the Paressí language, appear to belong to the Arawak-speaking family. Further northward are tribes with which the missionaries are planning to make contacts. To the west are the Nambicuara. Although officially on friendly terms there is considerable tension between the Protestant and Catholic missionaries, as they are competing for the allegiance of the same Indian population.

ECONOMY

Although the Nambicuara practice a shifting agriculture, their dependence upon the wild animal and plant life of the region is so extensive that they might well be classed as nomadic hunters and collectors. The semiarid plateau provides little in the way of agricultural land, game, or fish. What little farming is practiced is carried on in the narrow "galeria" forests of the headwater streams.

[p. 87(A)]

headwater streams. The deep clear streams make fishing with timbó difficult. Game in the forests and on the plain is scarce. Yet by exploiting all the resources of the area the Nambicuara are able to survive. In contrast to the other tribes reported in this monograph the Nambicuara have the broadest resource base, as the list of their resources in Appendix 1 indicates.

The Eastern Nambicuara occupy the high plateau between Utiarity and Vilhena. At Utiarity the altitude is 442 meters and at Vilhena 665 meters. The dry season extends from May to September. Except for occasional south winds, which bring a cold drizzling rain for a day or two, the season is clear, cool, and dry, the daily temperatures ranging from 60° to 80° F. During this period the grass withers, the livestock of the white men having to subsist on shrubs and what fodder the owners can provide. Horses and mules, particularly, suffer during these months. In August the Indians burn the dry grass so that with the first showers new grass can grow out and attract the deer, which the Indians can then hunt.

The dry season, which the Nambicuara call *kwénkisu*, is the most difficult. By the end of June they have consumed the manioc, maize, beans, and other crops which they have planted. During July and August they subsist on palm nuts, combarú beans, fruta de lobo, snakes, insects, fish, and whatever animals they can kill on the plateau or in the forest. The rainy season (*wahíasu*) is divided into periods depending upon the fruits as they come into season. September is known as *yadédunsu*, for during this period the people depend upon the jaboticaba fruit. October and November are called *ya'awadjítsu*, for during these months the bacaba palm nut ripens. December and January are termed *dhru*, or piqui time. February and March are known as *castíru*, which appears to cover a variety of berries and small fruits. April and May are termed *daugadítsu*, as many fruits and nuts come into season, particularly, the cashew nut. During these months the garden crops also come in, giving the Nambicuara a short period of abundance.

SETTLEMENTS AND SHELTERS

Each of the four Eastern Nambicuara bands has a defined area within which it hunts, fishes, collects, and grows its crops. These territories in-

The Wakitisu do not
323 make pottery, but they sometimes acquire pots from the Paressí in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakitisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[482 and carrying a burden basket on her back and a
854] baby strapped on her hip, an older child following
222 her. As they move slowly along they collect fruits, nuts, insects, snakes, ants, lizards, rats,
226 wild honey, and a great variety of grubs or larvae. When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262] These were later thrown on hot coals and eaten
223 without being cleaned. Small birds no larger
222 than a sparrow are shot if the man can get near enough to use his bow and arrow. If they come
[314] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

224 with them and informs the flanking hunters with bird calls. When completely surrounded the flanking parties drive the pigs back against the central group where the best archers are stationed. As the pigs charge back, they are shot at close range. Usually an arrow will stop a peccary so that it can be killed later with a club. If the hunters are well organized very few peccaries escape.

252 The hunters then open up all the pigs and take out the viscera. The entrails are emptied and [264] along with the heart, liver, etc., are thrown on hot coals to broil and are eaten on the spot. [412] When opening an animal the hunter grasps a handful of skin over the belly and cuts it off with a bamboo knife leaving a round hole through which the viscera are drawn out. After everyone has eaten, the carcasses are carried back to camp where the meat is cut up and shared among the families, the man with a large family getting more than one with a small family even though the [251] man had not shot anything. All meat that cannot be eaten in a day or two is cut up and dried.

224 The Nambicuara now have a few dogs which [231] they use when hunting jaguars. The dogs drive the jaguar into a tree where it can be shot with a gun or with arrows. Sometimes a wounded jaguar will attack the hunters, and injuries occur. Marciano's 6-year old son had his head and face clawed by a wounded jaguar which his father was not able to kill with the first shot of his shotgun.

Armadillos are dug out of holes. The soil is first loosened with a stick and then dug with a gourd, the diggers sometimes having to go as deep as 8 feet. When they get near the armadillo they put a long stick under it and force it up against the top of the hole in order to prevent it from digging further. When near enough a man reaches into the hole with his hand and pulls out the armadillo. If the hunters are very hungry [264] they will roast the armadillo on the spot, taking left-over pieces of roasted meat home to their families.

224 Although sharing is the custom, and it is amus-
264 ing to observe several men sitting around a 6-inch lizard to eat it, single hunters sometimes succeed in avoiding their obligations. One day as I walked along with Cascudo, followed by several Nambicuara some distance behind, he killed a snake and threw it into the bushes and signaled

224 to me not to say anything. Later that day he 264 returned to the spot, built a fire, roasted the snake, and ate it by himself.

224 Caymans are hunted by first finding their hide-outs under logs or overhanging banks. When one is found under an overhanging bank the hunters peel a number of slender poles and begin to thrust them down through the bank to force the cayman out. Men are stationed above and below the spot, and as the cayman comes out he is shot. When he hides under logs the hunters feel for him with their feet. The hunters are so nimble that few of them get bitten. The large rodent, paca, is also hunted in this way, for it hides in holes under overhanging banks.

The large water snake, anaconda, is hunted in pools where it lies in wait for game. When the hunters have trailed an anaconda to a water hole they keep shooting arrows into the water until they strike it. The first strike then indicates where the snake is, and they continue shooting until the snake weakens and can be pulled out. Sometimes the snake grabs a hunter by the arm, but the others are there to assist if anyone gets into difficulties.

Small anteaters are dug out of holes but the larger kind which does not go into holes is hunted by two men armed with clubs. The men chase it, one on each side, and as the anteater turns on one he strikes it on the nose with his club and then jumps into a tree. The other hunter then strikes it. This continues until the anteater dies.

Monkeys are chased from tree to tree until they tire and come down to hide in a hole in the ground. Dogs can then overtake the monkey or he can be shot or dug out of the hole. Deer usually do not fall when shot, but the hunter chases the wounded deer until he can shoot more arrows into it, especially into the legs.

[278 184] Although the Western Nambicuara are said to use arrows poisoned with curare, the Wakítisu say they do not use curare but that they know how to prepare it and that they formerly used it in raids. As arrows do not penetrate bone, the hunter tries to shoot at an angle so that the arrow will enter the chest cavity, or he will aim between the neck and the shoulder bone.

223 The Nambicuara hunt and eat all birds except the urubú. Large rheas are not hunted because it is difficult to approach them on the open sa-

223 vanna, but they hunt for rhea eggs and the young birds.

● 224 When hunting caymans they do not use the word "cayman," nor will they take their eggs for fear of angering the mother cayman. After [535] a jaguar or tapir is killed the hunters sing and dance the following night.

Every group hunt has a hunt leader who is an experienced man. He tells each man exactly what he is to do. Hunting such animals as peccary, tapir, and jaguar demands careful teamwork. If the band splits up to hunt, the band chief will appoint the hunt leaders. If any man disobeys the hunt leader he will take the man's bow away from him and send him back to camp where he has to listen to the riducule of the women. This is considered a great humiliation and happens only seldom and then to youths who are, as yet, inexperienced and overanxious to make a kill.

226 As the Nambicuara hunt along the banks of the rivers they are always ready to shoot any fish that happens to come near the bank. Sometimes they stand in one spot for hours waiting for pacú or matrinchã to pass near the bank. Certain berries which the fish like to eat are often thrown into the water to bring fish to the surface. At other times they tie a piece of broiled meat onto a stick and push the stick into the bottom. A man then stands on the bank, sucks air through his cupped hand, and as he lets the air out with a grunt he motions with his hand as if beckoning the fish to come near. This appears to be a magical act, for the Nambicuara claim that the fish understand the call. Sometimes they even talk to the fish saying that they have brought fat meat for them.

[824] Timbó fishing is practiced in the shallow cut-offs of the main streams. First the pond is dammed off, then bundles of timbó vine (*kúnte*) are thrown into the shallow water and beaten with sticks until the vines are crushed, the bundles are then doused in the deeper water. As the fish in the ponds are very small, they are scooped up with baskets, either the cylindrical burden baskets or a shallow square basket. They also use a conical trap made on the spot from a few sticks which they thrust into the weeds where the fish are hiding. When they have finished with this trap (*tandru*) it is thrown away. Compared with the efficient equipment and methods in the Upper

411 (1) The *hányesu*, an arrow which is used for [223 shooting monkeys and large birds, is made by lash-
● 224] ing an inch-long slender barb of siriva palm or piuva about an inch back from the sharpened point of the foreshaft.

[227] (2) The *saldítsu*, or fish arrow, is made by lashing four slender points of wood about 2 inches long to the end of the foreshaft. This arrow need not be feathered. Today wire is sometimes substituted for the wooden points.

[223] (3) The *dúnkisu*, or blunt bird arrow, used for shooting small birds, has a separate piuva foreshaft, the end of which forms a rounded flat surface about an inch in diameter.

[224] (4) The *hóptisu*, or big game arrow, has a broad split bamboo point about 12 inches in length which is lashed to the foreshaft. As the bamboo point is slightly grooved along the center, the foreshaft lies along the groove permitting it to be lashed firmly to the tapered sides of the point. Formerly curare poison was smeared along the groove. This was also the arrow used in war.

Sometimes a bamboo point is serrated on one or both sides. In former times, this arrowhead was poisoned with curare. It was attached loosely to the shaft so that when it struck an animal it became detached from the shaft. This arrow was used against big game like the jaguar, tapir, deer, and against human enemies.

The bow is held in a vertical position when shooting; the arrow is held with the thumb and forefinger while the middle and ring finger pull the bowstring, with the arrow resting against the hand side of the bow.

283 Cordage is made from the fibers of the tucum and buriti palms and from cotton. The tucum palm (*Astrocaryum tucuma*), *haldtsu*, provides not [306 only fiber but the hard shell of the nut is used for making the black, round, flat necklace washers, [252 and the thorns from the trunk are used as spikes in the manioc grater. Tucum twine which is a little stronger than buriti twine is used for bowstrings, for stringing beads, and for many other purposes. When a man needs tucum twine he sends his wife to gather the palm leaves. As the young trees grow in clumps, it is a simple matter for the woman to cut off a number of fronds. The woman then takes a long slender leaf, bends it double in the middle so that the woody fiber breaks, then doubles it back and pulls downward

[p. 94 (A)]

302 Whenever they received good presents such as axes or beads,
[431] they would go to the brook and return with their whole face set ablaze by the blood-colored paint.

[609] This practice was carried out on outsiders by the Tagnani as a mark of special esteem. We were all granted this honor in Três Buritis...

The men do not pluck their pubic or axillar hair; sometimes they even grow a sparse mustache or an even sparser beard. The women depilate themselves completely.

487 [244] The foot paths they use are narrow, similar to cow paths in pastoral regions; in certain areas, the ground is criss-crossed with them. They also make lanes in the woods by cutting branches.

To cross a small river they make a footbridge by cutting down a tree on the bank and guiding its fall in the right direction.

501 If the river is wide, they make a bundle of muriti leaves as a float and allow the current to carry them diagonally across the stream.

[Fig. 36]

481 They are not familiar with the canoe or with navigation; they are good swimmers.

They walk fast. They cover many leagues a day, always at a brisk pace--the "long stride" [marcha em extensão] of the physiologists--with the muscles taut, the body erect.

● 224 The hunting of big game--tapir, capybara, the Rondon Commission's horses and donkeys--is carried out in groups. For certain species they use special arrows that will be described later.

227 In fishing they do not use fishhooks, but special arrows. (1)
The Tagnani also use a kind of fish trap.

1. According to Ehrenreich the hook is not habitually used by the Indians because of the piranha fish (Pygocentrus sp.) which are so voracious that they do not allow the fisherman to gather in his catch. Nevertheless, a hook made of thorn--the so-called pindá dos tupis [Tupian fishhook]--is found in many areas.

[Fig. 37]

535 Anunze and Uintaçu tribes participated; and a festive dance in which we took part, executed in our honor at Três Buritis by the Tagnani and Tawite.

The war dance filmed in Campos Novos was later also [253] performed by the Tagnani in Três Buritis.

Armed with bows and arrows, the warriors form a line some 15 meters from a piece of wood which represents the enemy, singing in two-part time and marking the beat on the ground with their feet. [Fig. 25]

Two Indians leave the line, arrows ready and bows half strung, and walk as if cautiously hiding among shrubs in the bush. After a wide detour they come near the "enemy" and hurl their weapons at him.

This is the signal to attack; the singing ceases and a rain of arrows falls on the "unfortunate victim"...

411 Then they advance upon him and give him a thorough drubbing
524 with their bows or with sticks. Incidentally, this is always the func-
726 tion of the arrow--to immobilize the enemy or game and permit the attacker to come close and finish his work with blows. In the hunt or in combat, attack is always made from ambush. This is because the aim of the Indians at a distance [Fig. 27] is not as sure as generally supposed. The Nambicuara are not especially good archers. They certainly cannot draw the bow with their feet like the Bororo. Some can shoot well in height. They use no shield whatever either in the hunt or in war. After the attack they try to recover their projectiles. An arrow represents a certain amount of labor and must not be squandered...

They hold a number of arrows in their left hand and shoot them one after the other with incredible rapidity.

535 Men, women and girls participated in the festive dance.

A large circle was formed to the sound of an endless chant. The women stood on the men's left; pair after pair were joined until the circle was closed. [254] Each man placed his hand on the shoulder of the woman next to him. Within the circle, three girls of approximately the same age accompanied them in a close line, eyes lowered, hands crossed upon the chest. The girl in the center acted as a hub for this choreographic formation... [Fig. 43]

/216 cont./

224 278 411 [293] The poisoned arrows are intended for hunting certain animals, some large birds, cervids, and especially monkeys. Birds wounded by one of these arrows fall almost immediately.

A monkey mortally wounded with an ordinary arrow or even a bullet often remains hanging from the branches. Under the action of curare it holds itself immobile at first, then begins to tremble and falls several minutes later (five to 10 at the most) as soon as paralysis is produced.

A peccary or small deer such as the Cervus campestris wounded in the body runs for one or two minutes, then stops exhausted, is attacked by tremors and lies down.

The tapir, very large, resists a long time; it can run for two hours before stopping; hence the Indians do not hunt it with curare.

[262] [253] /217/ The meat of animals killed with curare may be eaten without harm; the Ñambikwara of the Juruena content themselves with cutting away the flesh around the wound impregnated with poison and colored yellow; the Çabanè do not even take this precaution.

278 411 726 Poisoned arrows are also used for war; this is perhaps their principal object among many Ñambikwara groups, who possess only a very few specimens during normal times.

None of the Indians know of an efficacious antidote. According to our informants wounds in the trunk would always be fatal to men. By immediately drawing out the arrow, it might be possible to survive a wound in a limb; in order to make their extraction more difficult, the points of the poisoned arrows, especially those of the Çabanè, are very lightly attached to their shafts.

796 The seasonal celebrations take place at the beginning and end of the rainy season, and probably mark the opening and closing of agricultural labor. They consist of festivals with dancing, singing and music. Several days in advance, hunting expeditions go in
● [226] search of small game, and they also go in for large fishing expeditions. In fact, fish seems to play a role of the first rank in the ritualistic
796 534 activities. (1) Other Indians leave, sometimes for far-off places in

1. See below, p. 109.

[224] order to find thick bamboo in the forests which border the rivers or which occupy the valleys, from which they cut pieces to make the flageolets for the ritual. These are about 70 centimeters long and pierced by four holes besides the one for blowing. An air passage is effected at the upper end in the mouthpiece of wax which closes the opening. They are only used upon occasion of these ceremonies and are played in unison in groups of three, one of them, engraved with a white longitudinal line, being named iomõte yilikãde, (chief flageolet), and played by the chief. A resonator made from a bamboo trunk furnished at the lower end with a hollowed-out gourd usually accompanies them (dutʔande, b1). The flageolets are called "male" and the resonators "female." Quite curiously, these flageolets are called iomõte (b1/2) and iamaka (c), by the central, northern and southern groups, that is from the same term (iamaka) by which the Paressi name the same instrument, while the eastern groups, who are the only immediate neighbors of the Paressi, employ a completely different term: kaigetasu (a 1/2). The Indians describe these festivals thus:

796 45. ukuerige ãidnige iuarhaidne ungʔrage (haidʔne) ãinsurgerage
to hide to blow to play [the flageolet] to make merry fishing.

nahundage tatige niuattahatrige kade kade kade ka aitendige
to carry to roast to make chicha moon moon moon this moon to dance

iukuohaindige mihadage komiegerage
and another time to play [the following month] more rain everything is dry

[105] mĩadage tutʔhaihaikuitrige
the rain is finished let [the flutes?] be carried away

haintendige halehaidnige denõ horatige ejeteende
to make the field feast the women are hidden they do not see it

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

When rains come, the *Nambicuara* settle in temporary villages, and the men open circular gardens in the gallery forest by burning and felling the trees with stone (now steel) axes. They till the soil with pointed sticks and raise both bitter and sweet manioc, several kinds of maize which are different from those of their more civilized neighbors (Roquette-Pinto, 1938, p. 297 n.), beans, gourds, cotton, urucú, and a variety of small tobacco with tiny leaves. Despite the difficulty of fishing in the deep, clear tributaries of the Juruena River, they have moderate success using fish arrows, basket traps, and a drug made of a vine.

Food preparation.—Game is usually only half cooked in hot ashes, but it is sometimes smoked on rectangular or pyramidal babracots. Manioc is grated on thorns of the catimá palm (*Iriartea* sp.) imbedded in palm wood planks. To remove the poisonous juice of bitter manioc, the pulp is either squeezed in a strip of bark twisted spirally or buried for several days to allow the juice to drain off. Balls of the pulp are then sun-dried and packed in leaves in baskets or buried at marked places. In times of scarcity, perhaps months later, the half-rotten balls are made into flat cakes, hastily cooked in hot ashes, and eaten.

The *Nambicuara* cannot bear to eat salt, which they do not know how to prepare, or pepper, which they do not cultivate. Even hot food is cooled with water before it is eaten. Wild honey, too, is diluted with water. The only condiment is a variety of cumarú bean which has a strong, bitter almond taste. It is boiled in pots; afterward the liquid is drunk and the beans are mixed with food, especially with grasshoppers crushed in mortars. Armadillo meat is often ground with maize flour.

Domestic animals and pets.—The *Nambicuara* have many pets, especially monkeys, coatis, parrots, and birds. Domesticated animals were unknown until the Rondón Commission introduced chickens and dogs. Although at first extremely afraid of dogs, the Indians quickly adopted them and treated them with the same deep affection they show all their tame animals. Even now they are terrified by oxen seen at telegraph stations, and call them by the name given to the deadly spirits of the water and the bush. They do, however, hunt and eat horses and mules as if they were wild game.

HOUSES

The surprising variety of house types suggests recent borrowing from neighboring tribes. The *Nambicuara*, like the *Siriono*, may formerly have lacked houses entirely. During most of the year, even at the present time, they build only scanty temporary shelters for a single night. These consist of branches of palms stuck into holes dug in the sand to form a half or quarter circle on the side from which the sun, the wind, or rain are expected (pl. 37, *center, left*). Each individual family builds its own

headwater streams. The deep clear streams make fishing with timbó difficult. Game in the forests and on the plain is scarce. Yet by exploiting all the resources of the area the Nambicuara are able to survive. In contrast to the other tribes reported in this monograph the Nambicuara have the broadest resource base, as the list of their resources in Appendix 1 indicates.

The Eastern Nambicuara occupy the high plateau between Utiarity and Vilhena. At Utiarity the altitude is 443 meters and at Vilhena 665 meters. The dry season extends from May to September. Except for occasional south winds, which bring a cold drizzling rain for a day or two, the season is clear, cool, and dry, the daily temperatures ranging from 60° to 80° F. During this period the grass withers, the livestock of the white men having to subsist on shrubs and what fodder the owners can provide. Horses and mules, particularly, suffer during these months. In August the Indians burn the dry grass so that with the first showers new grass can grow out and attract the deer, which the Indians can then hunt.

The dry season, which the Nambicuara call *kwakáre*, is the most difficult. By the end of June they have consumed the manioc, maize, beans, and other crops which they have planted. During July and August they subsist on palm nuts, combarú beans, fruta de lobo, snakes, insects, fish, and whatever animals they can kill on the plateau or in the forest. The rainy season (*wakáru*) is divided into periods depending upon the fruits as they come into season. September is known as *yadáduwu*, for during this period the people depend upon the jaboticaba fruit. October and November are called *yu'ewadjíru*, for during these months the bacaba palm nut ripens. December and January are termed *dáru*, or piqui time. February and March are known as *cuxíru*, which appears to cover a variety of berries and small fruits. April and May are termed *dzupadíru*, as many fruits and nuts come into season, particularly, the cashew nut. During these months the garden crops also come in, giving the Nambicuara a short period of abundance.

SETTLEMENTS AND SHELTERS

Each of the four Eastern Nambicuara bands has a defined area within which it hunts, fishes, collects, and grows its crops. These territories in-

The Wakitisu do not
323 make pottery, but they sometimes acquire pots from the Paresi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakitisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[142 and carrying a burden basket on her back and a
858 baby strapped on her hip, an older child following
222 her. As they move slowly along they collect fruits, nuts, insects, snakes, ants, lizards, rats, wild honey, and a great variety of grubs or larvae.
● 226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262] These were later thrown on hot coals and eaten
223 without being cleaned. Small birds no larger than a sparrow are shot if the man can get near
222 enough to use his bow and arrow. If they come
[314] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

223 vanna, but they hunt for rhea eggs and the young birds.

224 When hunting caymans they do not use the word "cayman," nor will they take their eggs for fear of angering the mother cayman. After [535] a jaguar or tapir is killed the hunters sing and dance the following night.

Every group hunt has a hunt leader who is an experienced man. He tells each man exactly what he is to do. Hunting such animals as peccary, tapir, and jaguar demands careful teamwork. If the band splits up to hunt, the band chief will appoint the hunt leaders. If any man disobeys the hunt leader he will take the man's bow away from him and send him back to camp where he has to listen to the ridicule of the women. This is considered a great humiliation and happens only seldom and then to youths who are, as yet, inexperienced and overanxious to make a kill.

• 226 As the Nambicuara hunt along the banks of the rivers they are always ready to shoot any fish that happens to come near the bank. Sometimes they stand in one spot for hours waiting for pacú or matrinchã to pass near the bank. Certain berries which the fish like to eat are often thrown into the water to bring fish to the surface. At other times they tie a piece of broiled meat onto a stick and push the stick into the bottom. A man then stands on the bank, sucks air through his cupped hand, and as he lets the air out with a grunt he motions with his hand as if beckoning the fish to come near. This appears to be a magical act, for the Nambicuara claim that the fish understand the call. Sometimes they even talk to the fish saying that they have brought fat meat for them.

[824] Timbó fishing is practiced in the shallow cutoffs of the main streams. First the pond is dammed off, then bundles of timbó vine (*kénte*) are thrown into the shallow water and beaten with sticks until the vines are crushed, the bundles are then doused in the deeper water. As the fish in the ponds are very small, they are scooped up with baskets, either the cylindrical burden baskets or a shallow square basket. They also use a conical trap made on the spot from a few sticks which they thrust into the weeds where the fish are hiding. When they have finished with this trap (*tondru*) it is thrown away. Compared with the efficient equipment and methods in the Upper

Xingú, the Nambicuara timbó fishing appears very elementary. The small fish are wrapped in leaves and placed in hot ashes until cooked. Large fish are broiled on a babracot. The Nambicuara also claim that they fish at night with torches along the river banks. This method may have been taken over from the Brazilians.

AGRICULTURE

The principal food crops grown by the Nambicuara are bitter manioc, sweetpotatoes, arrowroot, cará, maize, beans, and peanuts. To this list we must add such nonfood crops as cotton, tobacco, urucú, and gourds. The scientific and native names of these plants are listed in Appendix 1.[1] In more recent times they are known to produce sweet manioc and sugarcane. The dependence upon food crops in relation to game, fish, and wild food plants is difficult to gage. The statements of missionaries, however, appear to indicate that cultivated crops do not provide a year-round food supply and may actually play a minor role as compared with dependence upon noncultivated resources.

Farming is done on the slopes of the "galeria" forests, where, as we have seen, they also do most of their hunting and collecting. The Wakítisu band clears and cultivates a single field and, as we have said, lives in a single house while thus occupied. In the past the field (*kattzu*) was cleared with a stone ax (*stáaru*) and a wooden club (*kakwéeiru*). Today steel axes and machetes are used, but the method of planting is still the same. The efficiency of steel tools over stone axes and wooden clubs is indicated by the statement that in the past when a new field had to be cleared the people had to work during most of the wet season in order to fell the trees, a task which they now perform in May and June.

Formerly the light undergrowth was pulled out by hand and the bushes and saplings were beaten down with the wooden club. The Nambicuara had a unique way of felling trees. Starting near the bottom of the slope, they cut all the small trees part way through, then selected a number of large trees as kingpins. When these large trees were felled they knocked down the smaller trees below them. This was continued until they had a circular clearing of the required size on the slope. Today the clearing is done with axe and knives,

226 Tephrosia toxicaria is a poisonous legume, a kind of tingui
824 [Lupinus cascavella] used in fishing.
278 They are not familiar with the fishhook, and use [276: full page of figures] [277] a sort of fish trap made with bamboo or with the stem of the titara liana (Desmoncus sp.).
262 The following foodstuffs are represented in the collection.
--Guaiatú: white maize.
--Urinodzu: manioc dough, which under microscopic examination proved to be very rich in starch grains. The root, once grated, is pressed [by wringing] with a straw cord, the çaaru. (1) The grater
252 [1:5]

1. [Heloisa Alberto Torres notes that the cylindrical tube used to press manioc by some Amazonian tribes must have spread from the Guianas to the valley of the Amazon. Métraux considers the woven band used for the same purpose and found on the periphery of the tube territory a more primitive form. The simple straw cord of the Nambicuara would thus constitute an even more primitive variant.]

is of the type used by the Xingu Indians (Suya, etc.). It consists of a board with about two [twenty?] rows of small sticks.
[Fig. 17]
262 --The larvae of a butterfly, which they eat alive.
--Katunuzú: anthill clay, which they also eat.

. . . . . .

[828] --A mushroom, orelha de pau (Polyporus sp.), which is eaten, and beans (Phaseolus sp.) of unusual aspect were also found in one village. [278] The smoked [moqueada] head of a great anteater was [251] found in a basket by Miranda Ribeiro during the 1909 expedition.
415 Mortars (nutêzê) are hollowed out by means of fire and used to
252 pound meat and other foods.

411 (1) The *hányesu*, an arrow which is used for [223 224] shooting monkeys and large birds, is made by lashing an inch-long slender barb of siriva palm or piuva about an inch back from the sharpened point of the foreshaft.

[227] (2) The *saldítsu*, or fish arrow, is made by lashing four slender points of wood about 2 inches long to the end of the foreshaft. This arrow need not be feathered. Today wire is sometimes substituted for the wooden points.

[223] (3) The *dúnkisu*, or blunt bird arrow, used for shooting small birds, has a separate piuva foreshaft, the end of which forms a rounded flat surface about an inch in diameter.

[224] (4) The *hóptisu*, or big game arrow, has a broad split bamboo point about 12 inches in length which is lashed to the foreshaft. As the bamboo point is slightly grooved along the center, the foreshaft lies along the groove permitting it to be lashed firmly to the tapered sides of the point. Formerly curare poison was smeared along the groove. This was also the arrow used in war.

Sometimes a bambco point is serrated on one or both sides. In former times, this arrowhead was poisoned with curare. It was attached loosely to the shaft so that when it struck an animal it became detached from the shaft. This arrow was used against big game like the jaguar, tapir, deer, and against human enemies.

The bow is held in a vertical position when shooting; the arrow is held with the thumb and forefinger while the middle and ring finger pull the bowstring, with the arrow resting against the hand side of the bow.

283 Cordage is made from the fibers of the tucum and buriti palms and from cotton. The tucum palm (*Astrocaryum tucuma*), *haldítsu*, provides not [306] only fiber but the hard shell of the nut is used for making the black, round, flat necklace washers, [254] and the thorns from the trunk are used as spikes in the manioc grater. Tucum twine which is a little stronger than buriti twine is used for bowstrings, for stringing beads, and for many other purposes. When a man needs tucum twine he sends his wife to gather the palm leaves. As the young trees grow in clumps, it is a simple matter for the woman to cut off a number of fronds. The woman then takes a long slender leaf, bends it double in the middle so that the woody fiber breaks, then doubles it back and pulls downward

302 Whenever they received good presents such as axes or beads,
[431] they would go to the brook and return with their whole face set
ablaze by the blood-colored paint.

[609] This practice was carried out on outsiders by the Tagnani as a mark of special esteem. We were all granted this honor in Três Buritis...

The men do not pluck their pubic or axillar hair; sometimes they even grow a sparse mustache or an even sparser beard. The women depilate themselves completely.

487 [244] The foot paths they use are narrow, similar to cow paths in pastoral regions; in certain areas, the ground is criss-crossed with them. They also make lanes in the woods by cutting branches.

To cross a small river they make a foothridge by cutting down a tree on the bank and guiding its fall in the right direction.

501 If the river is wide, they make a bundle of muriti leaves as a float and allow the current to carry them diagonally across the stream.

[Fig. 36]

481 They are not familiar with the canoe or with navigation; they are good swimmers.

They walk fast. They cover many leagues a day, always at a brisk pace--the "long stride" [marcha em extensão] of the physiologists--with the muscles taut, the body erect.

224 The hunting of big game--tapir, capybara, the Rondon Commission's horses and donkeys--is carried out in groups. For certain species they use special arrows that will be described later.

● 227 In fishing they do not use fishhooks, but special arrows. (1)

The Tagnani also use a kind of fish trap.

1. According to Ehrenreich the hook is not habitually used by the Indians because of the piranha fish (Pygocentrus sp.) which are so voracious that they do not allow the fisherman to gather in his catch. Nevertheless, a hook made of thorn--the so-called pindá dos tupis [Tupian fishhook]--is found in many areas.

experiment with the resinous, supposedly poisonous substance found on the tip of one of these arrows. He injected a concentrated solution of it into frogs and guinea pigs, and the only resulting symptoms were muscular twitchings, unsteady gait, and some salivation.]

[Fig. 60]

441 Aieracú: The tip is blunt; it is used to stun birds that are to be caught alive or free from blood, which stains the feathers. [See fig. ... (59), p.55A] Often a smooth tip wrapped in a straw pellet is used for the same purpose.

[227] [274] Some unique fishing arrows have a double, triple or quadruple tip and a bone barb. [See fig. ... (37), p. 36B.] Some have feathers at the base, others do not. . . . .

All Serra do Norte arrows have shafts made of thin bamboo. The various parts of the weapon are secured with strips of the strong [824] imbé liana (Philodendron imbe, Mart.).

[Fig. 61] The clubs are extremely crude weapons of attack and defense, mere portions of thick branches cut when the occasion demands it.

[324] [275] The axes of chipped stone are uniform in type. They are wedge-shaped, made of diorite, and they average two kilograms in weight. The handle is a piece of creeper stem, perhaps from a Bauhinia. The pitch and cord used to fasten the stone make the tool surprisingly strong. . . . .

381 [824] The pitch is made of mastic resin, jatai (Hymenea stigonocarpa or H. stilbocarpa), and wax, as well as other unknown substances. It is placed in pots and subjected to the action of fire, then kept in pellets fastened to embira strips or in loaves wrapped in leaves. Both the arrow "poison" and the axe pitch are called by the name of duhutaarú, which means "wax."

[Fig. 62]

595
571 piece of small a[illegible]al. a5 asks for part of it and a4 answers:
"Let your father give you his." These relationships bring about
856 a rather curious consequence: the young girls become independ-
595 ent more rapidly than the boys. They follow the young wives,
take part in their activities, while the boys, left to themselves,
timidly try to adapt themselves to the group but without great
success, and usually remain, at least in earliest childhood, be-
side their mothers.

857 [70] Considering now the relationships of children among
themselves, the most striking characteristic is the absence of
play. In certain groups (central and south), the children
manufacture, although rarely, small objects of rolled or braided
straw, but generally they know no other distraction than fights
or contests which they do together, and lead an existence
modeled on that of the adults. In fact, they carry on the normal
day of the women: in the morning, preparing the manioc, then
the cumaru nuts, bathing when it begins to get warm; when the
sun is very high, retiring to the shade, and before night, gather-
ing wood for the fire. Likewise, the girls learn to weave, they
walk around, laugh, sleep. The little boys do not begin to
play with little bows and imitate the male pursuits until much
later (from 8 to 10 years on). But all become rapidly conscious
of the fundamental and sometimes tragic problem of Nambikwara
life, that of nourishment, and of the active role that is expected
of them. They take part in the harvesting and collecting ex-
peditions with great excitement. In time of need, it is not rare
to see them seek their own food outside the camp, working to
unearth roots, or walking in the grass on tiptoe, a large stripped
branch in hand, to catch grasshoppers. The little girls know
what an important role the women have in the economic life of
the tribe, and are impatient to make themselves worthy of it.
[231 Thus, we find a young girl (b5) who tenderly carries a puppy
482] in the tump line that her mother uses for her little sister, and
we make the remark:

16. uainuttte ufkɔrage
She caresses the little puppy?

Her mother answers me:

uefkuatnore uainuetuikɔdeʔena tãjtniene
The little girl caresses the puppy (because she wishes) to
raise it.

to which the little girl adds gravely:

857 b5, who insists that the treatment that one gives the small ani-
609 mal to divest it of its hair be applied to the ethnologist:

21. nʔiuɣenãghẽe nʔuɣẽeguedne (b1)
Put his beard in the fire! Roast his beard!

857 In general, they are to be good companions, enthusiastic, and
157 untiringly avid for games that are shown them. In exchange, they are very obliging informants once they have become friends. Al-
[551] most all the information which we were able to gather concerning proper names comes from them.[1]

● 231 This chapter cannot be ended without presenting some observations relating to domestic animals. Not only do the children actually live in very intimate relationships with the animals, but the latter are treated in the family like real children at least outwardly. We mean that they share the group's food, benefit from the same manifestations of tenderness or interest—delousing, games, conversation, caresses—as the human beings. In everything, their treatment is [73] curiously the same. The Nambikwara have numerous domestic animals, first of all dogs, and cocks and hens, who are all descendants of those introduced in their region by the Rondon Commission; monkeys, parakeets, birds of various kinds, and finally, the caetetu, the coati (Nasua sp.), the jaguatirica. Only the dog seems to have acquired an
[224] occasionally utilitarian role in the service of women, for hunting with the digging stick (cf. quotation No. 16). The men never use them for hunting with bow and arrow. The other ani-
231 mals are raised for the purpose of pleasure. They are not eaten,
262 the people do not consume the eggs of the hens who lay them in the bush. But they do not hesitate to devour a young bird if it dies after a vain attempt at acclimatization.

The terms used for behavior regarding animals are the same as those used for humans. They say dehẽna uɨtte uɨkɔrage, "the woman caresses the baby," or ɰãinuette uɨkɔrage, "the woman caresses the puppy."

231 While traveling, except for the animals capable of walking,
482 the whole menagerie is packed with the other baggage. The monkeys, attached to the women's hair, adorn them with an amusing living helmet, elongated by the long tail curled around the neck of the bearer. The parakeets and hens perch on top of the baskets, other animals are held in the arms. None of them receive abundant nourishment but, even in days of need, they
231 521 have their share, however little it may be. As compensation, they are an endless subject of distraction for the group, the

[1] [ie. From the children.--Analyst]

231 principal spectacle for amusement. One hears such exclama-
521 tions as:

22. jakhũninde ɾteru ɲirokũnene (b1)
The flying ants! He (the monkey) catches them to eat!

They talk to the monkey while giving him fruits: ɲoʂɾ, "take!" and as the monkeys live very intimately with the dogs, they laugh hilariously seeing their goings on:

23. hõte ɲãinde miramiraina hõte ɲairɾdniena (b1).
The monkey mounts the back of the dog! The monkey bites the dog!

and again:

24. kuɣariʂena tãkɲlahẽ tãkela aɣoriʂẽ kãdaiena (b1).
It is balancing head down, head down it balances, it fell! (the monkey).

231 The children like to play at burning animals, and when
857 insects are involved, they are allowed to do so; but if they try
[865] to burn domestic animals by touching them surreptitiously with a piece of smoldering wood, they are severely reprimanded.

[74] THE GRANDPARENTS

603 We use the term in the classificatory sense, that is, the members of the third ascendant generation. In general, there are few—two in restricted group a1, five out of 75 persons in the enlarged group, three out of 31 in enlarged group b1 (in this estimate we do not include A1, a2 and a14, who can be classed as grandparents indirectly). This small number is
[165 explained, in part, by the very high mortality rate of the
987] Nambikwara, and partially also by the fact that aged persons, although participating in the nomadic life, do not move with the same mobility as the other members of the group, and are met more rarely. Whatever the case may be, the grandparents share the life of their descendants. The founding of a new family does not erase the ties between adults and their parents. We have underlined several examples while studying the phenomena
[592] of residence. Aged or widowed parents join the household of their son or daughter, either permanently or temporarily. Thus, in the absence of his son-in-law (A21) and of his wife (a18), A17 installs himself with his daughter (a22) and her baby (a23). She is the one who cooks manioc and cumaru nuts for the three.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

When rains come, the *Nambicuara* settle in temporary villages, and the men open circular gardens in the gallery forest by burning and felling the trees with stone (now steel) axes. They till the soil with pointed sticks and raise both bitter and sweet manioc, several kinds of maize which are different from those of their more civilized neighbors (Roquette-Pinto, 1938, p. 297 n.), beans, gourds, cotton, urucú, and a variety of small tobacco with tiny leaves. Despite the difficulty of fishing in the deep, clear tributaries of the Juruena River, they have moderate success using fish arrows, basket traps, and a drug made of a vine.

Food preparation.—Game is usually only half cooked in hot ashes, but it is sometimes smoked on rectangular or pyramidal babracots. Manioc is grated on thorns of the catizal palm (*Iriartea* sp.) imbedded in palm wood plants. To remove the poisonous juice of bitter manioc, the pulp is either squeezed in a strip of bark twisted spirally or buried for several days to allow the juice to drain off. Balls of the pulp are then sun-dried and packed in leaves in baskets or buried at marked places. In times of scarcity, perhaps months later, the half-rotten balls are made into flat cakes, hastily cooked in hot ashes, and eaten.

The *Nambicuara* cannot bear to eat salt, which they do not know how to prepare, or pepper, which they do not cultivate. Even hot food is cooled with water before it is eaten. Wild honey, too, is diluted with water. The only condiment is a variety of cumarú bean which has a strong, bitter almond taste. It is boiled in pots; afterward the liquid is drunk and the beans are mixed with food, especially with grasshoppers crushed in mortars. Armadillo meat is often ground with maize flour.

Domestic animals and pets.—The *Nambicuara* have many pets, especially monkeys, coatis, parrots, and birds. Domesticated animals were unknown until the Rondón Commission introduced chickens and dogs. Although at first extremely afraid of dogs, the Indians quickly adopted them and treated them with the same deep affection they show all their tame animals. Even now they are terrified by oxen seen at telegraph stations, and call them by the name given to the deadly spirits of the water and the bush. They do, however, hunt and eat horses and mules as if they were wild game.

HOUSES

The surprising variety of house types suggests recent borrowing from neighboring tribes. The *Nambicuara*, like the *Siriono*, may formerly have lacked houses entirely. During most of the year, even at the present time, they build only scanty temporary shelters for a single night. These consist of branches of palms stuck into holes dug in the sand to form a half or quarter circle on the side from which the sun, the wind, or rain are expected (pl. 37, *center, left*). Each individual family builds its own

224 with them and informs the flanking hunters with bird calls. When completely surrounded the flanking parties drive the pigs back against the central group where the best archers are stationed. As the pigs charge back, they are shot at close range. Usually an arrow will stop a peccary so that it can be killed later with a club. If the hunters are well organized very few peccaries escape.

252 The hunters then open up all the pigs and take
[264] out the viscera. The entrails are emptied and along with the heart, liver, etc., are thrown on hot coals to broil and are eaten on the spot.
[412] When opening an animal the hunter grasps a handful of skin over the belly and cuts it off with a bamboo knife leaving a round hole through which the viscera are drawn out. After everyone has eaten, the carcasses are carried back to camp where the meat is cut up and shared among the families, the man with a large family getting more
[251] than one with a small family even though the man had not shot anything. All meat that cannot be eaten in a day or two is cut up and dried.

224 The Nambicuara now have a few dogs which
[231] they use when hunting jaguars. The dogs drive the jaguar into a tree where it can be shot with a gun or with arrows. Sometimes a wounded jaguar will attack the hunters, and injuries occur. Marciano's 6-year old son had his head and face clawed by a wounded jaguar which his father was not able to kill with the first shot of his shotgun.

Armadillos are dug out of holes. The soil is first loosened with a stick and then dug with a gourd, the diggers sometimes having to go as deep as 8 feet. When they get near the armadillo they put a long stick under it and force it up against the top of the hole in order to prevent it from digging further. When near enough a man reaches into the hole with his hand and pulls out the armadillo. If the hunters are very hungry
[264] they will roast the armadillo on the spot, taking left-over pieces of roasted meat home to their families.

224 Although sharing is the custom, and it is amus-
264 ing to observe several men sitting around a 6-inch lizard to eat it, single hunters sometimes succeed in avoiding their obligations. One day as I walked along with Cascudo, followed by several Nambicuara some distance behind, he killed a snake and threw it into the bushes and signaled

000 [411] 203 [245] The Tagnani also use a kind of fish trap.

A rare type of blunt arrow is designed for the capture of birds which serve as playmates to Nambicuara children.

The birds are felled by the impact and caught easily. Some 231 [825] become used to their cruel captivity; a woodpecker (Colaptes campestris, Vieil) was occasionally imprisoned by a boy under a gourd. No sooner did the child remove the cup than the bird, instead of flying away, would perch upon him. It is true that the Indian nourishes his domesticated birds very well: he constantly feeds them from his own mouth, gently gorging them.

[Fig. 59]

To our intense surprise, as the cephalic measurements of an Anunze woman were being taken, a baby rat fell from the nape of her neck where it had apparently been living cozily, hiding in her hair as in the grass where it was born.

[825] Doves (Chamepelius talpacoti), young vultures (Sarcoramphus papa, Catharista atratus brasiliensis, Bonap), monkeys and small owls are also domesticated in the Serra do Norte.

Before the days of the Rondon Commission, the Nambicuara were not familiar with the ox, the mule or the dog. They are still afraid of the ox because of its horns; they have a liking for the donkey, whose meat they find similar to that of the tapir.

[246] They are now good friends of the dog, which at first frightened them greatly; they steal a few whenever they can, and these dogs quickly take a fancy to [the Indians] because they are so well fed. In the master's eating gourd there is always room for the dog's muzzle.

855 They carry their children in a strap slung over the shoulder and across the chest, which the Cocozu make with straw and the others with cotton.

484 They take along everything they own on the shortest excursions; this is a nomadic habit surviving among a nearly sedentary people.

241 A population as large as that of the Serra do Norte would be unable to subsist exclusively on hunting and fishing. The Indians would be forced to travel far and wide in search of food; they would have been annihilated long ago, or else deprived of those characteristics which only their isolation could maintain.

411 thickness in the middle. This bow is made from the honey-colored heartwood of a small piuva tree. After cutting a piece of the required length the bow maker splits it by using two or three axes. He then trims off the outer layer of wood with an ax, shapes it with a knife, and polishes it with lixeiro leaves. The inner side of the bow is flat or slightly concave, depending upon how the wood splits. Shoulders are made at each end to hold the bowstring. The bow is made from green wood, no attempt being made to season it. The siriva bow is the same shape and is made in the same way but [184] the black wood surrounding the center is used. The siriva bow is more common among the Western Nambicuara.

[283] The bowstring (*kalawotsiwa*) is made from tucum fiber and is about one-eighth of an inch in thickness. The cord is much longer than required and the extra length is wound around the bow for about 6 inches just above the hand hold. The cord is wound from left to right, the running end being brought back over the previous turn to form a cross on the inside of the bow. The string is always smeared with urucú (*dáse*). As the bowstring wears out it is not removed but new lengths of tucum fiber are woven into the extra length.

The basis of the Eastern Nambicuara arrow is the jointless shaft (*alalwá'ikalu*), which appears to be cane (*Gadua* sp.). Before being made into an arrow the cane shaft is heated over a fire to harden it. Into this cane shaft, which is roughly three-eighths of an inch in diameter, a piuva foreshaft (*ikálikatsalu*) is inserted for a distance of 4 or 5 inches, leaving about 20 inches protruding. The joint is wound with sipó vine for about [237] 6 inches. To feather the arrow, a 10-inch macaw feather (*alúwatsa*) is split and the halves are laid parallel to one another on opposite sides of the [284] butt end of the shaft. The feathers are lashed to the shaft with cotton twine, the lashings being about an inch apart. Although the feathers are laid straight along the shaft, they assume a propellerlike pitch which gives the arrow its revolving [237] motion when in flight. The lashings are covered with beeswax. The butt has a V-notch to hold the bowstring, which is again tightly wound with [284] waxed cotton twine. By attaching various parts to the end of the foreshaft, four different kinds of arrows about 5 feet long are made.

301 imitate our wedding rings; necklaces [242], several meters long, made of black beads, the feathers of black birds, the limbs of coleopters, also black; all attest to this preference.

[Fig. 45]

[237] The women make beautiful one-piece bracelets from the tail rings of the giant armadillo which they polish with wet stones. [See Fig. 65, p. 59A.]

[184] The Uaintaçu Nambicuara, who come to Campos Novos by way of the Guaporé and who are much more insolent, crude, wary and suspicious, do not attempt to wear the delicate lip plugs used by their relatives.

Some of them wear a porcupine quill fastened to their lip; others, a wooden splinter or a spike from some tree.

291 562 Also characteristic of the whole Serra do Norte and Juruena Valley is a palm-fiber cape (ialacu), which hangs down the backbone from the neck. [See Fig. 66, p. 59B.] Women do not wear it; it is another example of male foppishness.

302 Body painting with urucu constitutes part of the ornamentation for men as well as for women.

[Plates, p. 236]

[243] They paint themselves on festive occasions; they do not draw lines on the skin, but smear the dye all over their face. Women, after bathing, redden their whole body in this fashion.

[515]

[Fig. 44]

[382] The Indians of the Juruena dissolve the urucu powder in pure water; the Tagnani prepare a paste or cream by mixing the dye with the fat of various animals, and perfume it quite pleasantly by way of some unknown process. (1)

1. The Bororo use mastic resin to perfume the urucu paste. See Alfredo de Andrade, "Estudo dos materiaes corantes [A Study of Coloring Materials]," Archivos do Museu Nacional, Vol. 28, p. 183.

● 237 301 Featherwork is scarce and in fact insignificant. One of the illustrations in this book [p. (608)] shows an interesting feather diadem patterned after an object of similar type but of admirable craftsmanship which the Indians purloined from their neighbors to the west and which is also to be found in the [National] Museum. (2) [Fig. 42]

2. Semicircular straw head ornaments are to be found mainly in the state of Amazonas as well as among the Huari of the Guaporé River, who resemble the Nambicuara in their primitive axes, their circular houses, etc. (Cf. Nordenskjöld, "The Ethnography of South America Seen from Mojos in Bolivia." [Engl.]).

The use of cotton has given an extraordinary boost to the development of featherwork among the Tupian Indians, as I demonstrated with the gorgeous ornaments made by the Urubu Indians (Gurupi River). The Nambicuara are familiar with cotton, but have not even developed featherwork based on plaiting or netting; this seems to attest to a tradition poor in such textile techniques. The Guayaki, who are Tupian Indians of rudimentary culture, according to Vellard, have neither featherwork nor agriculture. (R. L.)

535 We were able to observe two types of dances: a war dance which we recorded in a film shown at the National Library [of Rio de Janeiro] on March 15, 1913, and in which Indians of the Cocozu,

D. Ornamental motif of the Serra do Norte Indians.

301 [823] [280] [One necklace not mentioned earlier] is made with the seeds of a Cyperacea (tanieikerê) which the Suya of the Xingu River also use. . . . .

[825] [824] Oradaikruzê is a beautiful bracelet made with the tail rings of the giant armadillo (Dasypus gigas). It looks like ivory. Other bracelets are made from the nuts of the babassu and pindova (Orbignya speciosa) palms.

[Fig. 65]

Bands for the upper arm are made of cotton and fastened similarly to those of the Paressi.

291 The jalaçu is a simple fiber cape, widely used, which fastens to the neck and hangs down the back. There is also a black feather cape in the collection.

301 [281] The stem of the unetizũ (nose plume) is made of thin bamboo or the stalk of a tough grass (Andropogon).

. . . . The helmets of puma or jaguar hide are used in that region only by the Nambicuara and by the Cayabi of the Paratininga.

[Fig. 66]

285 Max Schmidt broadly classified Brazilian Indian plaiting into Palmblattflechterei (palm-leaf plaiting) and Doppelfadengeflechte (double-strand plaiting). But he also admitted the existence of a third type, where two elements running in different directions are crossed by a third. This type occurs frequently on the Xingu River . . . and is found in Nambicuara baskets (atiçũ).

[282: page of figures]

[283] As plaiting material the Nambicuara use titara liana and sometimes bamboo.

[293] . . . . Nambicuara fans, made with bacaba leaves, . . . are of pentagonal shape . . . .

534 [171] A kind of nose flute made of gourd discs (hait-teataçũ) seems to have been borrowed from the Paressi.

[Fig. 67]

The double flutes were borrowed from the Tapajoz tribes (Mundurucu, Maue, etc.). [See fig. . . . (70, p.]

278 Curare of the Ñambikwara of the Rio Juruena

The technique of the Ñambikwara of the right bank of the Rio Juruena is more primitive.

They use only bark which has just been gathered. The draining off of the bark is done only once and with warm water: the bark /216/ is put on the fire in a rather large amount of cold water, and the operation is ended when the temperature reaches 37° to 40° /centigrade/. It is filtered quickly by squeezing the bark with the hands to extract all the liquid from it. Then comes rapid boiling over a high fire and skimming. After several minutes of a rolling boil the fire is lowered and the liquid kept at a temperature a little below boiling until it has a pasty consistency.

[415] [237] The curare is kept in paste form in bamboo tubes or changed into a very hard mass by the addition of meliponine beeswax.

This method exposes the curare to strong heat for at least two hours. The Çabanè method reduces this time to ten minutes, the other operations being carried out at low heat. Both produce curares with about the same activity.

[192] [411] The Rio Juruena Ñambikwara call curare and the plant a'utĭsú or a'ukisú; the roots ta'ãdisú; the poisoned arrow aurũ kiritkatsú, and its protective bamboo sheath asirikatsú.

Utilization of Curare

278 411 The Ñambikwara are not familiar with the blowgun. They use curare to poison large arrows with long, notched points, capped with a protective bamboo sheath. The points of the Tamandé curare arrows are shorter and more slender than those of the other Ñambikwara. They are usually placed in twos, threes, and fours under a single protective sheath.

According to the Indians an arrow's activeness does not last more than three or four months. The curare in paste form is kept for a longer time (close to a year). Hard curare can be kept for years.

121 In other publications (2) we have brought up the question of

knowing if the type of life of the Nambikwara, apparently very primitive, does or does not constitute the authentic vestige of ancient conditions. Considered in the present, their level of culture is certainly very low. They live naked, especially the women, who only wear a thin string of buriti beads around the waist, some earrings, necklaces worn around the neck or looped over the shoulder, [14] bracelets made from the tail of the large armadillo, and, sometimes, some narrow bands of cotton woven by their husbands, or some buriti straw, tightly bound around the biceps, and wooden pins. Besides the same ornaments, the men sometimes put on a sort of straw pompom, fastened to the waist above the sex organs, and smaller ones, attached to cotton bracelets; on the other hand, they do not wear shell bracelets. The complete ignorance of the hammock and the Nambikwara
[513] custom of sleeping on the ground (or, more rarely, on long strips of the bark of the palm tree paxiuba) has intrigued ethnologists for a long time. This sentiment is shared by neighboring tribes, and the
[101] Paresi, mentioning this peculiarity, call the Nambikwara Uaikoakoré, "those who sleep on the ground."

221 The Nambikwara year must be divided into two distinct periods. During the rainy season (from October to March), each group settles on some small elevation rising above the course of some stream. The Indians then construct crude huts with curious variations in form and materials. They burn clearings in the approaches to the forests which
221 occupy the humid valley floor, and there they plant and cultivate
241 gardens principally with the starch-yielding plants of the manihot genus (sweet and bitter) and tobacco, sometimes some peas, cotton, peanuts, and calabash (Lagenaria sp.). They grate the yucca (manioc) on planks covered with the sharp bark of the palm tree, they press it with the aid of a piece of twisted bark. The garden produce furnishes food resources sufficient for part of the sedentary period, and even of use later: the Nambikwara preserve the yucca by burying the residue of the grated pulp in the ground.

221 At the arrival of the dry season, they abandon the village, or rather the site of temporary residence, and each group "breaks up," if one can say that, into several nomadic bands. For about seven

SP17 Nambicuara SP17

When rains come, the *Nambicuara* settle in temporary villages, and the men open circular gardens in the gallery forest by burning and felling the trees with stone (now steel) axes. They till the soil with pointed sticks and raise both bitter and sweet manioc, several kinds of maize which are different from those of their more civilized neighbors (Roquette-Pinto, 1938, p. 297 n.), beans, gourds, cotton, urucú, and a variety of small tobacco with tiny leaves. Despite the difficulty of fishing in the deep, clear tributaries of the Juruena River, they have moderate success using fish arrows, basket traps, and a drug made of a vine.

Food preparation.—Game is usually only half cooked in hot ashes, but it is sometimes smoked on rectangular or pyramidal babracots. Manioc is grated on thorns of the catizal palm (*Iriartea* sp.) imbedded in palm wood plants. To remove the poisonous juice of bitter manioc, the pulp is either squeezed in a strip of bark twisted spirally or buried for several days to allow the juice to drain off. Balls of the pulp are then sun-dried and packed in leaves in baskets or buried at marked places. In times of scarcity, perhaps months later, the half-rotten balls are made into flat cakes, hastily cooked in hot ashes, and eaten.

The *Nambicuara* cannot bear to eat salt, which they do not know how to prepare, or pepper, which they do not cultivate. Even hot food is cooled with water before it is eaten. Wild honey, too, is diluted with water. The only condiment is a variety of cumarú bean which has a strong, bitter almond taste. It is boiled in pots; afterward the liquid is drunk and the beans are mixed with food, especially with grasshoppers crushed in mortars. Armadillo meat is often ground with maize flour.

Domestic animals and pets.—The *Nambicuara* have many pets, especially monkeys, coatis, parrots, and birds. Domesticated animals were unknown until the Rondón Commission introduced chickens and dogs. Although at first extremely afraid of dogs, the Indians quickly adopted them and treated them with the same deep affection they show all their tame animals. Even now they are terrified by oxen seen at telegraph stations, and call them by the name given to the deadly spirits of the water and the bush. They do, however, hunt and eat horses and mules as if they were wild game.

HOUSES

The surprising variety of house types suggests recent borrowing from neighboring tribes. The *Nambicuara*, like the *Siriono*, may formerly have lacked houses entirely. During most of the year, even at the present time, they build only scanty temporary shelters for a single night. These consist of branches of palms stuck into holes dug in the sand to form a half or quarter circle on the side from which the sun, the wind, or rain are expected (pl. 37, *center, left*). Each individual family builds its own

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

Gardening exists only during the rainy season and does not free the Nambikuara from wandering during the seven months of the dry season, looking for wild roots, fruits and seeds, small animals such as lizards, snakes, bats, spiders and grasshoppers and, generally speaking, anything which may prevent them from starving. As a matter of fact, their geographical surroundings, which are located in the northwestern part of the state of Mato Grosso and include the headwaters of the Tapajos, Rio Roosevelt and Rio Gi-Parana, consist of a desolated savanna with few vegetal resources and still less game.

Had I approached my subject from a point of view other than the one outlined above, I could not have avoided a long discussion in South American cultural history, aimed at clearing up this apparent primitiveness, on the question as to whether the survival of early conditions of life in South America is genuine or whether we should consider it as a more recent—although undoubtedly pre-columbian—result of culture clashes and processes of acculturation. Whatever the answer may be, it cannot substantially change our problem: whether tarriant or recessive, the Nambikuara society functions, in the present, as one of the simplest forms of human society to be conceived. We shall not seek information from the particular history which kept them in their exceptionally crude organization or brought them back to it. We shall only look at the experiment in social anthropology which they now enact under our very eyes.

This holds especially true in respect to their social and political life. For if we do not know what was the material culture of the Nambikuara forty years ago (they were discovered only in 1907), we do know that their numbers became tremendously reduced after their contact with white civilization. General (then Colonel) Candido Mariano da Silva Rondon, who discovered and studied them, first stated that their number was about 20,000. This was around 1915. I take this figure as greatly exaggerated, but even if reduced by one half, it considerably exceeds the present number which is hardly more than 2,000. Epidemics have taken care of the difference. What does this mean, from the point of view of our study? During the dry season, the Nambikuara live in nomadic bands, each one under the leadership of a chief, who, during the sedentary life of the rainy months, may be either a village chief or a person of position. General Rondon wrote that, at the time he was exploring the country, it was not rare to see bands averaging two or three hundred individuals. Now, sixty or seventy

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

Vilhena. These Indian Posts have had only limited success in attracting the Nambicuara, because the region is agriculturally so poor that it is difficult to grow enough food to maintain a settled population, and at present the Indians only visit these posts occasionally.

Intensive missionary activity among the Nambicuara began when two American Protestant missionaries, Arthur F. Tylee and William R. Henricks, established a mission station at Juruena in 1925. In October 1930, the Reverend Mr. Tylee, his baby daughter, Miss Mildred Kratz (nurse), and three Brazilians employed by the mission were killed by the Nambicuara belonging to Julio's band. Mrs. Tylee, although struck three or four times on the head while rushing to her child who was still in bed, was only stunned and came to after the Indians had left. One Brazilian hired man escaped to get help from the telegraph station. Some years later new Protestant missions were established at Campos Novos (Nambicuaras) and at Utiarity. At present only the mission station at Utiarity is in operation.

The Jesuits established a mission at Juruena about 1930, but in 1940 moved it to its present site in Utiarity. Today both the Protestant and Catholic missions are, therefore, located in Utiarity, which not only is connected by truck road to Cuiabá but is also centrally located. To the east and south are the remnants of the Paressí, and to the north, the Iranxe, who, although not speaking the Paressí language, appear to belong to the Arawak-speaking family. Further northward are tribes with which the missionaries are planning to make contacts. To the west are the Nambicuara. Although officially on friendly terms there is considerable tension between the Protestant and Catholic missionaries, as they are competing for the allegiance of the same Indian population.

ECONOMY

Although the Nambicuara practice a shifting agriculture, their dependence upon the wild animal and plant life of the region is so extensive that they might well be classed as nomadic hunters and collectors. The semiarid plateau provides little in the way of agricultural land, game, or fish. What little farming is practiced is carried on in the narrow "galeria" forests of the headwater streams.

[p. 87 (A)]

361 clude at least one stretch of river and the "galeria"
621 forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. Within this hunting territory they have camping places rather than villages. A semipermanent camp site where fields are cultivated for 2 or 3 years is known as *sinciésu*. Any place where the band or a family may stop overnight is known as *siénsu*. At present the
342 Waklítisu band has one house (*sísu*) at the place
621 where it is farming. The entire band occupies the house, each family having its own fire around
[513] which it sleeps at night. The unmarried men gather around another fire. Julio informed me that their house is rectangular with stake walls and a gable roof covered with sapé thatch. Some years ago when the band was larger he said they occupied a different place on which they built three houses. These houses were built by placing a series of saplings into the ground to form an oval. The tops were then fastened to a ridge pole, the framework being covered with sapé or palm fronds. A smaller beehive-shaped house is made
[343 in the same way. Houses of this type are from
346] 6 to 10 feet high. Near the living house they build a small flute hut (*sinedónklesu*) and, when the occasion demands, a shaman's hut (*sihdentsu*).

342 If the weather is cold while they are out hunting the band or the family may build a temporary brush hut for the night. Sometimes only a windbreak (*siotdutsi*) is considered sufficient. On warm nights during the dry season the group camps under a tree. In favorite hunting places the same camp site will be used repeatedly.
[241] When the soil around the permanent camp site or village becomes exhausted, fields are cleared some distance away and small huts are put up for the workers. As the distance increases the old camp site is eventually abandoned and a new camp site is established.

352 As the Nambicuara do not use hammocks,
beds, or seats, there is not much in the way of
415 furniture in their shelters. Utensils are restricted to a few gourd vessels, tin cans, burden baskets and small flat baskets, fire fans, bows and arrows,
[482 and tools used by men. When they move, these
462] articles are placed in burden baskets which are carried by the women. The Waklítisu do not

Xingú, the Nambicuara timbó fishing appears very elementary. The small fish are wrapped in leaves and placed in hot ashes until cooked. Large fish are broiled on a babracot. The Nambicuara also claim that they fish at night with torches along the river banks. This method may have been taken over from the Brazilians.

AGRICULTURE

The principal food crops grown by the Nambicuara are bitter manioc, sweetpotatoes, arrowroot, carâ, maize, beans, and peanuts. To this list we must add such nonfood crops as cotton, tobacco, urucú, and gourds. The scientific and native names of these plants are listed in Appendix 1.[1] In more recent times they are known to produce sweet manioc and sugarcane. The dependence upon food crops in relation to game, fish, and wild food plants is difficult to gage. The statements of missionaries, however, appear to indicate that cultivated crops do not provide a year-round food supply and may actually play a minor role as compared with dependence upon noncultivated resources.

Farming is done on the slopes of the "galeria" forests, where, as we have seen, they also do most of their hunting and collecting. The Waklîtisu band clears and cultivates a single field and, as we have said, lives in a single house while thus occupied. In the past the field (*haîtsu*) was cleared with a stone ax (*stúnsu*) and a wooden club (*hukwénisu*). Today steel axes and machetes are used, but the method of planting is still the same. The efficiency of steel tools over stone axes and wooden clubs is indicated by the statement that in the past when a new field had to be cleared the people had to work during most of the wet season in order to fell the trees, a task which they now perform in May and June.

Formerly the light undergrowth was pulled out by hand and the bushes and saplings were beaten down with the wooden club. The Nambicuara had a unique way of felling trees. Starting near the bottom of the slope, they cut all the small trees part way through, then selected a number of large trees as kingpins. When these large trees were felled they knocked down the smaller trees below them. This was continued until they had a circular clearing of the required size on the slope. Today the clearing is done with axes and knives,

[1] [Cat. 116, pp. 121-126.—Pan.] [p. 90 (B)]

●241 but the method of felling is the same. All clearing has to be completed by the end of June to permit the felled trees to dry.

In late August, when the cicada begins to sing and the first thunder is heard, the Nambicuara return to undertake their planting activities. At a given signal, men with lighted bunches of dry grass set fire to dry trees and bushes all around the edges of the field. The rest of the people are concentrated at the river's edge at the bottom of the slope, and as animals, such as rats, lizards, and snakes, flee toward the water they kill them. [222] After the fires have died down the people go through the field collecting grubs, insects, and whatever else that is edible.

Among the stumps and unburnt logs the Nambicuara hoe up hills about 3 feet in diameter into which they stick 6 or 7 pieces of last season's manioc stems, each about 10 inches long. These hills are made about 5 or 6 feet apart. Formerly they used a digging stick (*kadikádsu*) but today the metal hoe (*isakúlusu*) is used. Bitter manioc (*walídnsu*) is their most important crop.

After the rains have begun and the manioc is several inches high, they begin to plant maize (*kaydítsu*) of which the Nambicuara have several varieties. Maize is planted between the manioc hills by making a hole in the ground with a digging stick into which 2 seeds are dropped. As the holes are about 6 inches deep, the seeds are not covered. Whether this is to protect the seeds from birds is not clear.

When the maize has grown tall enough to provide shade they plant beans (*kwɋ'su*), sweetpotatoes (*wísu*), and tobacco (*ítsu*). The bean which the Nambicuara grow looks like a large red kidney bean and has a tough skin. Beans are planted one seed to a shallow hole and covered. Sweetpotatoes are planted by placing cuttings in shallow trenches near logs and stumps. When 249 planting tobacco a man places a handful of seeds on a leaf, climbs onto a high stump, and blows the fine seeds so that they scatter over the field. They weed the field only once when the maize is 248 about a foot or two in height. Cotton is planted in the field but urucú bushes and gourds are planted near the houses. After the planting is finished and the field is growing well the people leave on their continuous rounds of hunting, fishing, and collecting.

[P. 91 (A)]

252 placed on a platform under which a fire is lighted. In this manner large quantities of *kinokáyere* can be prepared in one day.

When a woman gets ready to bake a manioc cake she pushes the hot coals and burning wood to one side and pats down the hot bed of the fire with a flat piece of wood. She then breaks off pieces from a dried manioc loaf and crumbles them over the bed of the fire by rubbing them in her hands. When she has crumbled up enough dry manioc, she pats down the flour to form a round, flat cake about 10 inches in diameter and from 1 to 2 inches in thickness. She covers the cake first with hot ashes and then hot coals. After one-half hour she uncovers her oven to find a brown cake covered with ashes and cinders. This sour, dirty, gritty product in no way compares with the fine-textured, sweet *menyú* of the Camayurá, the meal for which is prepared by crushing the dry ball in a mortar, then sifted to remove the rough fibers, after which the flour is dampened and baked on a pottery baking plate. Sometimes the whole manioc loaf is placed in the fire, and as it bakes the Nambicuara begin to break off pieces from the outside. For ceremonial purposes they bake cakes about 2 feet in diameter.

● 241 Toward the end of the rains in April and May the Nambicuara return to their fields to enjoy the fresh garden products. The harvest is inaugurated with a harvest ceremony (*hoikónakíduzu*). [262] [252] Fresh maize, peanuts, and sweetpotatoes are roasted, manioc cakes are prepared, and, if possible, manioc juice is boiled to make chicha. These garden products, along with meat, supply the [534] food for the feast, which lasts for several days. The sacred flutes (*wainkú*) are played in the flute hut, the spirits of the ancestors are present, and food and drink are offered to them.

221 The subsistence activities of the Nambicuara are, thus, closely associated with the annual cycle of growth in which agriculture forms but a part. The dependence of the Nambicuara upon the wild products of the forest and plateau are much more complex than has been indicated. They supplied long lists of names of plants, insects, and animals for which no Portuguese names could be found. A full understanding of their economic dependence upon the environment would come only by someone following a band of Nambicuara throughout the year to observe the complete annual cycle of

757 patient. The juice of a certain plant is put into the cavities of teeth to stop toothache. The juice of boiled roots and leaves are taken internally for stomach disorders. One day I observed a woman pressing her foot over her husband's forehead as he lay on the ground. The heel was placed over the eye and she exerted considerable pressure. She was doing this to cure her husband's headache. These nonmagical practices are known to everyone. Some herbal medicines, however, are known only to the shamans and are used under the directions of the *anâses*.

778 The sacred flutes (*wdiwiku*) are associated with
534 *ekkkdilisu*, the culture hero, agriculture, and chieftainship. As these flutes are similar in appearance to the sacred flutes of the Paressí, among whom they have great significance, it is possible that the Nambicuara obtained them originally from the Paressí. The flutes are about 2 feet long with four holes at the lower end and are made from a jointless piece of bamboo. When the band settles down near their manioc fields they build a special hut for the flutes, but when they are wandering around, the flutes are hidden in the
[784] woods. Women are not permitted to see the flutes, and if one should accidently see them her stomach would swell and she would become ill. But what appears more important is the fact that the flutes poison people who do not treat them well. Yet, as only the chief and the head shamans play them this would mean that the flutes are the symbols of authority representing the men in whom power is invested. The flutes, four of which should be in every band, do not represent a spirit but appear to be more like fetishes. Boiled manioc juice is poured into them and they are offered maize and broiled meat.

● 241 The *wdiwiku* are played after the fields have been
775 planted and again at harvest time. After planting, the men gather into the flute hut and play
533 the flutes and sing the *wdiwiku*. The ghosts of the dead participate and, along with the flutes, are offered food and drink. At harvest time another ceremony called *Anikwakidutu* is performed at night during which the flutes are played and special songs are sung. The following day the whole band participates in a dance. The ghosts also take part in this ceremony.

534 In addition to the *wdiwiku* flutes, the Nambicuara have a smaller four-stop bamboo flute called

APPENDIX 1

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéra, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákoré and Quihaniéré to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guaycurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoákoré, and who, as now stated, are Nhambiquára. This name of Uáikoákoré is given by the Parecí of the sub-tribes Kaxiniti and Uaimaré of the rivers Arinos, Sacuriá-iná, Tabóra-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Caleçal and Jauxá. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of coconut. They wear armlets, bracelets, leg ornaments and bead collars made from the fruit of the mbacába. They live by the chase, but also plant maize, yams, potatoes, manioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atsiri and the Amúsha of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kóshó of the Parecí, made from pounded manioc. The native lewa or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Ganini and wax, and is preserved in leaves of the Malá-malá palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or parrot feather for a nose-ornament. Such a decoration is usually received for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 38 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malá-malá and bees. The upper disk has three orifices.

[Fig. 18]

241 They subsist chiefly on the produce of husbandry; the development of agriculture in their backward milieu [229] constitutes one of the paradoxical traits of this tribe.

242 As a general rule, it may be said that the Nambicuara eat of everything; unlike some other Indians, they do not shun certain species of animals. A mosquito that lands on their body, a louse, a locust, a small lizard that scampers by--nothing is spared.

[250] Some of them carry sticks to kill any snakes they may encounter; they roast them in the embers and eat the delicacy with pleasure.

After roasting their catch, they discard only the stomach.

At the camp on the Primavera River, whenever one of them was hungry he would run off into the bush and return with a live calango [a small lizard]; after beating the head of the little animal against a piece of wood [230] he would throw it into the hot ashes. Later he would tear open the animal's abdomen with his nails, remove the stomach and enjoy the rest. On another occasion, the Indians caught an armadillo and killed it by twisting its neck.

In hunting and fishing they use arrows that will be described later.

252 They prepare the eggs of the wild duck (Cairina moschata,
253 L.) by nestling them in shallow depressions in the embers after
[255] turning them on a diminutive spit stuck through a small hole punched in the shell.

The meat of large game--deer, paca (Coelogenis paca),
[225] capybara (Hydrochoerus capybara)--is utilized only after it has been pounded in a mortar or beaten between two pieces of wood.

[Fig. 19]

244 They cut off large pieces with their nails, with their teeth, and sometimes with knives of wood or bamboo. No sooner have they gulped down what is in their mouth than they suck their fingers, clucking their tongue noisily.

251 The Tagnani are familiar with the preserving properties of smoke; the meat we handed out to them was not all eaten on the same day. They hung the remnants on the barbecue [moquém].

264 The children partake of a meal immediately; the women eat later... whatever is left over, if there is a leftover. This, by the way, is the rule even among civilized Indians... But in general, if there is plenty, each helps himself to whatever there is, when he wishes and as he wishes; the food belongs to all.

262 [236] They skillfully remove the gall bladder from the liver of the animals they devour, but they do not have a special name for it.

[252] Aarú is a cake which the Cocozu prepare by pounding up a whole roasted armadillo in a mortar until its bones are completely mashed, and then mixing it with manioc dough in the form of beiju.

[225] An upland rat (Scapteromys guambiquarae, Miranda Ribeiro), which the Parecsi call cólori, is prized by the Nambicuara as a delicacy. They call it arantacú.

241 They gather and utilize the produce of their husbandry from day to day. They have no special harvesting time, and no stores or surpluses except for the tobacco which they keep between two sticks hanging from the ceiling thatch.

251 There is always manioc dough in the house; it is the Nambicuara bread, which they eat with all their other foods. They keep the dough in large baskets lined with pacova (1) leaves.

1. A kind of banana. (Ed.)

[237] Leftover honey is kept in the gourd; it does not reach fermentation because the desire [to drink it] soon revives in some Indian...

261 We did not see any rite connected with food; but the soldier
[115] Gouveia, who was held prisoner in a Nambicuara village for six months in 1911, witnessed such a ceremony. The Indians of that village (which was named Urutau) had killed a large tapir. (1) This was
[118]

1. Tapirus americanus, fairly abundant along the rivers of the area. Hard to catch because very wary.

[the pretext for] a feast. They dragged the animal to the village plaza. Then the men went off into the bush to gather branches with

[945] The Tagnani also use a kind of fish trap.

A rare type of blunt arrow is designed for the capture of birds which serve as playmates to Nambicuara children.

The birds are felled by the impact and caught easily. Some become used to their cruel captivity; a woodpecker (Colaptes campestris, Vieil) was occasionally imprisoned by a boy under a gourd. No sooner did the child remove the cup than the bird, instead of flying away, would perch upon him. It is true that the Indian nourishes his domesticated birds very well: he constantly feeds them from his own mouth, gently gorging them.

[Fig. 59]

To our intense surprise, as the cephalic measurements of an Anunse woman were being taken, a baby rat fell from the nape of her neck where it had apparently been living coxily, hiding in her hair as in the grass where it was born.

Doves (Chamepelia talpacoti), young vultures (Sarcoramphus papa, Catharista atratus brasiliensis, Bonap), monkeys and small owls are also domesticated in the Serra do Norte.

Before the days of the Rondon Commission, the Nambicuara were not familiar with the ox, the mule or the dog. They are still afraid of the ox because of its horns; they have a liking for the donkey, whose meat they find similar to that of the tapir.

[946] They are now good friends of the dog, which at first frightened them greatly; they steal a few whenever they can, and these dogs quickly take a fancy to [the Indians] because they are so well fed. In the master's eating gourd there is always room for the dog's muzzle.

They carry their children in a strap slung over the shoulder and across the chest, which the Cocozu make with straw and the others with cotton.

They take along everything they own on the shortest excursions; this is a nomadic habit surviving among a nearly sedentary people.

A population as large as that of the Serra do Norte would be unable to subsist exclusively on hunting and fishing. The Indians would be forced to travel far and wide in search of food; they would have been annihilated long ago, or else deprived of those characteristics which only their isolation could maintain.

241 It was the practice of agriculture--and we do not know where they borrowed it, if it did not arise among them spontaneously--which enabled them to continue living in the stone age until today.

By cultivating the rich lands of the Juruena Valley and the Serra do Norte and entrusting their sustenance to the soil of the virgin Amazon forests, the Nambicuara were able to continue living until now in that relatively restricted environment. This paradoxical effect of agriculture may not yet have been found elsewhere in so distinctive a form; and because they were forced to subsist by cultivating the earth, they perfected this industry while remaining in a very elementary stage of civilization. Wholly isolated, without any knowledge of white men or their domestic animals [247] such as the dog, the Indians of the Serra do Norte became excellent farmers.

Their plots are always evenly circular. Large open spaces are frequently found in the forest; they are artificial fields, old Nambicuara plots.

The Indians use fire to clear these plots after cutting down the trees, which until now they felled with stone axes. In order to fell a large tree, several axemen gather around it; and the wood, gnawed by the stone, yields sooner than expected. The strength of the axe handle is truly remarkable.

[Fig. 22]

A pointed stick is used to make holes for [planting] seeds.

Maize and manioc are the principal products of Nambicuara agriculture. Both belong to the same species cultivated among us. Maize is of the variety known as white maize or sabaró; the manioc [246] has unusual nutritive value. In fact, the manioc cultivated by the Tagnani is the best I have seen, low in fiber content and very rich in starch.

[248] Surely the root does not owe its excellent qualities to the imperfect cultivation of the Indians, but to the very fertile land where it is planted.

The great ethnographic question raised by aboriginal agriculture and brought into sharp focus by Martius still remains unanswered.

Neither maize nor manioc have been found growing wild in the jungle. Either these plants came from elsewhere with the Indians,

● 24 or else they were derived from other species which grow wild in very different forms, disguised in various ways.

In any case, we found an isolated tribe in the stone age, subsisting on agriculture and cultivating maize (1) and manioc identical to ours.

1. The Nambicuara corn cobs which are to be found at the National Museum are of three kinds, each solid in color, fully kernelled, large, and of first quality. They deserve the attention of our geneticists, especially in view of the fact that maize is a heterogamous plant subject to the hazards of cross-fertilization. . . . . Nambicuara maize must be of pre-Columbian Peruvian origin . . . .

The secret of [its] selectivity must be the cultivation of each variety in an "aboriginal field" entirely isolated from the others by stretches of jungle; the term "aboriginal field" was given by Gen. Rondon to those clearings made in the jungle by the Indians for purposes of cultivation.

It would be advisable to study aboriginal agriculture thoroughly, as Hoehne already has pointed out, for the standard products obtained [by the Indians] prove that they possess keen genetic intuition. (A. J. deS.)

At the Fourth Maize Fair (Rio, 1918) many corn cobs cultivated in Rondonia were exhibited. It was concluded that Nambicuara maize should be considered autochtonous, for it displays hues entirely unknown to cultivators of the civilized world. Although the external coloring varies, the albumen of Rondonia maize is invariably very soft and white.

241 [Plates p. 254]

[249] Yet a wild form of manioc has been found (Manihot utilissimo, Pohl); if not the very species we use, at least one of the same genus. But maize?

Where on the surface of the earth does maize exist in a wild state except for the tunicated Zea mais which is sometimes considered to be the ancestor of the modern species?

What unveiling of mysteries, if this question were to be answered!

Some Tagnani who were watching the herdsman João Lucas weed a small plot in Três Buritis began to laugh at him, indicating that it would be better to root up the weeds; the hoe severed the stems but left in the roots, and the plants would grow up again. When the Nambicuara weed, they pull out everything that is not useful. Their plots are always clean.

Their tobacco is the Nicotiana that grows wild in their mountains; it may not properly be said that urucu and cotton are cultivated: they are planted and utilized. Some large beans of various kinds de-
278 241 serve mention. [250] They are to be found in the Indians' baskets along with many other plants; but we never saw an Indian eating them or making any use of them. Pending further research, I am of the opinion that they are saved for medicinal undertakings carried out in secret by old men and women. The same may be said of the castor oil plant (Ricinus communis), which is definitely adventitious.

[Fig. 39]

415 The spools of cotton fiber that await spinning and the seeds saved for future use are kept out of the weather, dust and rain in bags made of straw or pacova leaves.

[Fig. 40]

759 It seemed to us that medicine was not exercised by any special segment of society. They all take part in the treatment of certain diseases; in serious cases, an experienced elder takes over.

752 Wounds are dressed with straw fibers [coated] with certain resins (jatobá). Burns are treated with cold water. Fractures and dislocations are reduced haphazardly.

372 They make fire with mastic resin sticks, the tips of which are wrapped in straw to protect them from the rain.

[Fig. 63]

241 415 Their plots are worked with pointed sticks. The seeds of urucu, gourd plants (Lagenaria) and cotton are kept in leaf containers.

275 824 Medicinal fruit (Solanum mammosum) is also saved, as well as roots, leaves, etc.

[Fig. 31]

386 The collection contains two samples of dyes: a paste of urucu and fat, sweetly scented, which the women use to paint their body after the bath (huduhukaidi); and a variety of red ocher. [279]

248 Cotton (1) is represented by seeds (rim de boi variety) in leaf

[[71]]

1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Andes and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[203 256] containers; cotton thread (kondzú) from a spindle (gdaretatú); skeins [855] of spun cotton; cotton fabric (sareguêzê--strap used to carry children). The spindle is made of a palm splinter imbedded in a round [283] potsherd.

[Fig. 64]

415 824 Kateçú are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

[See fig. ...(28) p. 308.]

241 but the method of felling is the same. All clearing has to be completed by the end of June to permit the felled trees to dry.

In late August, when the cicada begins to sing and the first thunder is heard, the Nambicuara return to undertake their planting activities. At a given signal, men with lighted bunches of dry grass set fire to dry trees and bushes all around the edges of the field. The rest of the people are concentrated at the river's edge at the bottom of the slope, and as animals, such as rats, lizards, and snakes, flee toward the water they kill them. [222] After the fires have died down the people go through the field collecting grubs, insects, and whatever else that is edible.

Among the stumps and unburnt logs the Nambicuara hoe up hills about 3 feet in diameter into which they stick 6 or 7 pieces of last season's manioc stems, each about 10 inches long. These hills are made about 5 or 6 feet apart. Formerly they used a digging stick (*kadikddsu*) but today the metal hoe (*isakúlusu*) is used. Bitter manioc (*walídnsu*) is their most important crop.

After the rains have begun and the manioc is several inches high, they begin to plant maize (*kaydtsu*) of which the Nambicuara have several varieties. Maize is planted between the manioc hills by making a hole in the ground with a digging stick into which 2 seeds are dropped. As the holes are about 6 inches deep, the seeds are not covered. Whether this is to protect the seeds from birds is not clear.

When the maize has grown tall enough to provide shade they plant beans (*kwǫ'su*), sweet-potatoes (*wisų*), and tobacco (*ítsu*). The bean which the Nambicuara grow looks like a large red kidney bean and has a tough skin. Beans are planted one seed to a shallow hole and covered. Sweetpotatoes are planted by placing cuttings in shallow trenches near logs and stumps. When 249 planting tobacco a man places a handful of seeds on a leaf, climbs onto a high stump, and blows the fine seeds so that they scatter over the field. They weed the field only once when the maize is ● 248 about a foot or two in height. Cotton is planted in the field but urucú bushes and gourds are planted near the houses. After the planting is finished and the field is growing well the people leave on their continuous rounds of hunting, fishing, and collecting.

[p. 91(A)]

513 At the post of Três Buritis, where they camped with us for a few days, they disputed every night the occupancy of a crude wooden table where the station personnel ate their meals; they already appreciated our habit of sleeping above the ground.

Why, then, did they not make use of the hammocks? Because they were not familiar with it.

[248 824] They are capable of plaiting cotton and tucum (1) thread more

1. Bactris setosa (Ed.).

than adequately enough to make a hammock; and they are also capable of appreciating their neighbor's hammock, as indeed they do now.

This ethnographic trait attests to the inferior position of the Serra do Norte Indians.

[171] [228] This unfamiliarity [with the hammock] is in fact characteristic of the large Ge-Botocudo group of Brazil, which in the consensus of all who have studied it comprises the most backward aborigines in the Americas.

All Serra do Norte Indians sleep directly upon the earth. They spread nothing in the way of leaves, straw, pallets or hides between themselves and the ground.

They nearly always rest on their side, pillowing the head on the forearm.

516 The men rarely sit directly on the ground; they usually squat. The women do the reverse. If standing in one spot for more than a few minutes, a man will usually flex one leg and rest his foot against the other knee; the women assume a characteristic posture which I have never seen described and which is clearly shown on the photographs we took.

They cross their thighs, thrusting the right part of the pelvis forward and the left part forcibly backward. The longitudinal axis of the right foot, if extended, cuts that of the left foot almost at a right angle.

They frequently cross their arms.

201 When excited or roused by happiness or fear, they repeatedly slap the back of their head with their open right hand. When displeased, they make the same gesture while exclaiming: "Ikátnerá!"

372 They make fire with mastic resin sticks, the tips of which are wrapped in straw to protect them from the rain.

[Fig. 63]

241 415 Their plots are worked with pointed sticks. The seeds of urucu, gourd plants (Lagenaria) and cotton are kept in leaf containers.

275 824 Medicinal fruit (Solanum mammosum) is also saved, as well as roots, leaves, etc.

[Fig. 31]

386 The collection contains two samples of dyes: a paste of urucu and fat, sweetly scented, which the women use to paint their body after the bath (huduhukaidi); and a variety of red ocher. [279]

248 Cotton (1) is represented by seeds (rim de boi variety) in leaf

[171]

1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Andes and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[203 236] containers; cotton thread (kondzú) from a spindle (gdaretatú); skeins [855] of spun cotton; cotton fabric (sareguêzê--strap used to carry children). [283] The spindle is made of a palm splinter imbedded in a round potsherd.

[Fig. 64]

415 924 Kateçú are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

[See fig. ...(28) p. 308.]

241 but the method of felling is the same. All clearing has to be completed by the end of June to permit the felled trees to dry.

In late August, when the cicada begins to sing and the first thunder is heard, the Nambicuara return to undertake their planting activities. At a given signal, men with lighted bunches of dry grass set fire to dry trees and bushes all around the edges of the field. The rest of the people are concentrated at the river's edge at the bottom of the slope, and as animals, such as rats, lizards, and snakes, flee toward the water they kill them. [222] After the fires have died down the people go through the field collecting grubs, insects, and whatever else that is edible.

Among the stumps and unburnt logs the Nambicuara hoe up hills about 3 feet in diameter into which they stick 6 or 7 pieces of last season's manioc stems, each about 10 inches long. These hills are made about 5 or 6 feet apart. Formerly they used a digging stick (*kadikádzu*) but today the metal hoe (*kakádzu*) is used. Bitter manioc (*wakádzu*) is their most important crop.

After the rains have begun and the manioc is several inches high, they begin to plant maize (*kapátzu*) of which the Nambicuara have several varieties. Maize is planted between the manioc hills by making a hole in the ground with a digging stick into which 2 seeds are dropped. As the holes are about 6 inches deep, the seeds are not covered. Whether this is to protect the seeds from birds is not clear.

When the maize has grown tall enough to provide shade they plant beans (*kuɛ'ɛu*), sweet-potatoes (*wiɛu*), and tobacco (*ɛtɛu*). The bean which the Nambicuara grow looks like a large red kidney bean and has a tough skin. Beans are planted one seed to a shallow hole and covered. Sweetpotatoes are planted by placing cuttings in shallow trenches near logs and stumps. When ● 249 planting tobacco a man places a handful of seeds on a leaf, climbs onto a high stump, and blows the fine seeds so that they scatter over the field. They weed the field only once when the maize is 248 about a foot or two in height. Cotton is planted in the field but urucú bushes and gourds are planted near the houses. After the planting is finished and the field is growing well the people leave on their continuous rounds of hunting, fishing, and collecting.

[p. 91 (A)]

224 with them and informs the flanking hunters with bird calls. When completely surrounded the flanking parties drive the pigs back against the central group where the best archers are stationed. As the pigs charge back, they are shot at close range. Usually an arrow will stop a peccary so that it can be killed later with a club. If the hunters are well organized very few peccaries escape.

252 The hunters then open up all the pigs and take
[264] out the viscera. The entrails are emptied and along with the heart, liver, etc., are thrown on hot coals to broil and are eaten on the spot.
[442] When opening an animal the hunter grasps a handful of skin over the belly and cuts it off with a bamboo knife leaving a round hole through which the viscera are drawn out. After everyone has eaten, the carcasses are carried back to camp where the meat is cut up and shared among the families, the man with a large family getting more
[251] than one with a small family even though the man had not shot anything. All meat that cannot be eaten in a day or two is cut up and dried.

224 The Nambicuara now have a few dogs which
[231] they use when hunting jaguars. The dogs drive the jaguar into a tree where it can be shot with a gun or with arrows. Sometimes a wounded jaguar will attack the hunters, and injuries occur. Marciano's 6-year old son had his head and face clawed by a wounded jaguar which his father was not able to kill with the first shot of his shotgun.

Armadillos are dug out of holes. The soil is first loosened with a stick and then dug with a gourd, the diggers sometimes having to go as deep as 8 feet. When they get near the armadillo they put a long stick under it and force it up against the top of the hole in order to prevent it from digging further. When near enough a man reaches into the hole with his hand and pulls out the armadillo. If the hunters are very hungry
[264] they will roast the armadillo on the spot, taking left-over pieces of roasted meat home to their families.

224 Although sharing is the custom, and it is amus-
264 ing to observe several men sitting around a 6-inch lizard to eat it, single hunters sometimes succeed in avoiding their obligations. One day as I walked along with Cascudo, followed by several Nambicuara some distance behind, he killed a snake and threw it into the bushes and signaled

252 The Nambicuara method of processing manioc in comparison with that of the Camayurá is simple and crude. The following describes the method used today: Marciano's wife dug up a burden basket full of manioc from a field belonging to the Protestant Mission. She sat under a tree [177] and peeled the tubers with an old butcher knife (formerly a piece of bamboo was used). She washed the peeled tubers and placed them in a calabash. She then took a grater made from a piece of kerosene box about 2 feet long and 6 inches wide to which an 18-inch strip of perforated tin was nailed. She placed one end of the grater in a larger copper basin (belonging to the mission) while the other end rested on the edge, and while steadying the grater with one hand she grated the tuber with the other. The tubers did not stand in water nor were they dipped in water during the process of grating.

After the tubers were grated she dipped out a calabash full of mash and began pressing it with her hands and pouring the juice into another calabash. After she had drained off as much juice as possible she picked up a handful of mash (*wénere*) and rolled it and squeezed it until no more juice could be expelled. This ball she placed in another calabash and continued making balls until the calabash was full. She then patted down the balls to form a round loaf about 10 inches in diameter and 4 inches thick, which she set out on the bare ground to dry in the sun. [251] After several days in the sun these loaves get hard and dry and form the storable product (*kiaskdayare*) from which the edible cake *kó'tsire* (also called *wakdnare*) is baked. The juice (*eyéuse*) which was left in the calabash she poured into a slight depression in the ground, and after the liquid had drained off she collected the thin film of starch flour (*akatsáiru*) along with some sand, rolled it into a ball, and placed it in hot ashes to bake. [415] The lack of pottery vessels prevents the Nambicuara from saving and boiling the juice. They know, however, that the juice is valuable, and when they have cooking vessels they boil it to form a thick porridge.

When the Nambicuara wish to prepare a greater quantity of pulp they use a piece of bast for a press. This is a piece of embira bark about 3 feet long and 8 inches wide called *sáru*. A woman rolls a ball of pulp in the strip of bark and twists the bark until the pulp is dry. The balls are then

853 nail she opened the rat and threw the viscera and
252 the rat on the coals. Within 15 minutes that rat was eaten, entrails and all, while Kaoro and I looked on in a state of horrified fascination.
[862] Children thus begin by eating broiled meat and fish; pieces of sour, gritty manioc cake are given to them at a more advanced age.

PUBERTY

881 When a boy reaches the age of 14 or 15 he has
[304] his upper lip and the septum of his nose pierced with a sharpened fibula of a monkey ("macaco-prego"). One man holds the boy's arms, another his head, while an older male relative performs the piercing. Small plugs of bamboo are then placed in the holes. The following night the shaman leads the band in singing and dancing. Food is prepared in large quantities and offerings are made to the ghosts who are believed to be present
[553] at the ceremony. The boy is now given a name which he will keep throughout his life. If the boy's father is dead he will use his father's name. If the father is alive he will use the name of some dead member in his grandfather's generation. In this way names are passed from one generation to another. An important part of the boy's puberty ceremony is the ritual beating administered by the old men of the band. He is now permitted to take part in the singing and can be present when the sacred flutes are played in the flute hut. Although this creates an attitude of obedience to the older men, he still continues to be abusive toward the women of the band. His unmarried female cross cousins now begin to notice him and openly show their desire to go hunting with him.

The puberty ceremony for girls is much more elaborate. After a girl has her first menses her father builds a small hut in the center of the camp, in which the girl is secluded. She must remain in this hut day and night and is attended by her
[202] female relatives. The chief then calls all members of the band together, even sending messengers to distant hunting parties. When the band is united the chief organizes a hunt in which all the men take part, and they must remain away from the
● [251] camp until the moon is full. While on the hunt they accumulate a great quantity of smoked meat. When the moon is full, the men send a messenger to the camp to whom the women give some of the

[p. 103(B)]

[Fig. 18]

241 They subsist chiefly on the produce of husbandry; the development of agriculture in their backward milieu [229] constitutes one of the paradoxical traits of this tribe.

242 As a general rule, it may be said that the Nambicuara eat of everything; unlike some other Indians, they do not shun certain species of animals. A mosquito that lands on their body, a louse, a locust, a small lizard that scampers by--nothing is spared.

[252] Some of them carry sticks to kill any snakes they may encounter; they roast them in the embers and eat the delicacy with pleasure.

After roasting their catch, they discard only the stomach.

At the camp on the Primavera River, whenever one of them was hungry he would run off into the bush and return with a live calango [a small lizard]; after beating the head of the little animal against a piece of wood [230] he would throw it into the hot ashes. Later he would tear open the animal's abdomen with his nails, remove the stomach and enjoy the rest. On another occasion, the Indians caught an armadillo and killed it by twisting its neck.

In hunting and fishing they use arrows that will be described later.

252 They prepare the eggs of the wild duck (Cairina moschata,
242 L.) by nestling them in shallow depressions in the embers after
[245] turning them on a diminutive spit stuck through a small hole punched in the shell.

The meat of large game--deer, paca (Coelogenis paca),
[225] capybara (Hydrochoerus capybara)--is utilized only after it has been pounded in a mortar or beaten between two pieces of wood.

[Fig. 19]

244 They cut off large pieces with their nails, with their teeth, and sometimes with knives of wood or bamboo. No sooner have they gulped down what is in their mouth than they suck their fingers, clucking their tongue noisily.

251 The Tagnani are familiar with the preserving properties of smoke; the meat we handed out to them was not all eaten on the same day. They hung the remnants on the barbecue [moquém].

264 The children partake of a meal immediately; the women eat later... whatever is left over, if there is a leftover. This, by the way, is the rule even among civilized Indians... But in general, if there is plenty, each helps himself to whatever there is, when he wishes and as he wishes; the food belongs to all.

262 [236] They skillfully remove the gall bladder from the liver of the animals they devour, but they do not have a special name for it.

[252] Aarú is a cake which the Cocozu prepare by pounding up a whole roasted armadillo in a mortar until its bones are completely mashed, and then mixing it with manioc dough in the form of beiju.

[325] An upland rat (Scapteromys gnambiquarae, Miranda Ribeiro), which the Paresi call cólori, is prized by the Nambicuara as a delicacy. They call it arantaçú.

241 They gather and utilize the produce of their husbandry from day to day. They have no special harvesting time, and no stores or surpluses except for the tobacco which they keep between two sticks hanging from the ceiling thatch.

251 There is always manioc dough in the house; it is the Nambicuara bread, which they eat with all their other foods. They keep the dough in large baskets lined with pacova (1) leaves.

1. A kind of banana. (Ed.)

[237] Leftover honey is kept in the gourd; it does not reach fermentation because the desire [to drink it] soon revives in some Indian...

261 We did not see any rite connected with food; but the soldier
[159] Gouveia, who was held prisoner in a Nambicuara village for six months in 1911, witnessed such a ceremony. The Indians of that village (which was named Urutau) had killed a large tapir. (1) This was
[158]

1. Tapirus americanus, fairly abundant along the rivers of the area. Hard to catch because very wary.

[the present for] a feast. They dragged the animal to the village plaza. Then the men went off into the bush to gather branches with

214 [Lupinus cascavellia] used in fishing.
278 They are not familiar with the fishhook, and use [276: full page of figures] [277] a sort of fish trap made with bamboo or with the stem of the titara liana (Desmoncus sp.).
262 The following foodstuffs are represented in the collection.
--Guaiatú: white maize.
--Urinodzu: manioc dough, which under microscopic examination proved to be very rich in starch grains. The root, once grated,
252 is pressed [by wringing] with a straw cord, the çaaru. (1) The grater
[145]

1. [Heloisa Alberto Torres notes that the cylindrical tube used to press manioc by some Amazonian tribes must have spread from the Guianas to the valley of the Amazon. Métraux considers the woven band used for the same purpose and found on the periphery of the tube territory a more primitive form. The simple straw cord of the Nambicuara would thus constitute an even more primitive variant.]

is of the type used by the Xingu Indians (Suya, etc.). It consists of a board with about two [twenty?] rows of small sticks.
[Fig. 17]
262 --The larvae of a butterfly, which they eat alive.
--Katununú: anthill clay, which they also eat.

. . . . . .

[628] --A mushroom, orelha de pau (Polyporus sp.), which is eaten, and beans (Phaseolus sp.) of unusual aspect were also found in one village. [278] The smoked [moqueada] head of a great anteater was
[251] found in a basket by Miranda Ribeiro during the 1909 expedition.
415 Mortars (nutêzê) are hollowed out by means of fire and used to
252 pound meat and other foods.

carry water. Pottery, unknown to the eastern groups, is crude everywhere else. There are neither canoes nor dugouts. The Indians make five different types of musical instruments, all winds, which are often heard in festivals.

The difference in physical appearance between the Nambikwara and their eastern, western and southern neighbors—Paressi, Tupi-Kawahib and the tribes of the Guaporé—is striking. (2) And they

2. The anthropological study of the Nambikwara was the object of research of Dr. J.-A. Vellard, who was part of our expedition.

also differ from most of the other tribes of Brazil, whose physical type is generally more massive than theirs. In the case of the Nambikwara, the body is not exceptionally small; but they are slim, and their long hair, sometimes wavy and of more developed pilosity than the indigenous median, their hands and feet of reduced dimensions, their fine lineaments, and above all their faces, of characteristic outline but very purely chiseled, contribute to form a physical type far removed from that encountered most often in South America, but which reminds one persistently of certain types of southern Mexico and Guatemala, and even more of that characterized by the masks with pointed beards of the region of Vera Cruz.

• • • •

The Nambikwara get up at dawn, stir up the fires, warm themselves as well as they can after the cold of the night, then they eat lightly of the [16] remains of last evening's yucca cakes. A little later the men leave, together or separately, for a hunting expedition. The women remain in the camp where they devote themselves to culinary duties. The first bath is taken when the sun begins to come up. The women and children often bathe together for amusement, and sometimes a fire is lighted before which they crouch to warm themselves on coming out of the water while they playfully exaggerate a natural shivering. Other bathing takes place during the day. The daily occupations vary little. The preparation of food is that which requires the most care and time. Yucca must be ground and pressed, and the pulp dried and cooked. Or else the cumaru nuts (Dipteryx odorata) which add their perfume to most dishes must be shelled and boiled. When the need is felt, women and children go out on foraging expeditions. If the provisions are sufficient, the women spin, crouched

593 of the couple among the Nambikwara. It is the economic and psycho-
593 logical unit par excellence. Not only among errant bands which are
182 made and unmade unceasingly does the couple appear as the only
462 stable reality (at least theoretically), but it is the couple alone which assures the subsistence of the members of the group. The Nambikwara live under a double economy: the economy of hunters and gardeners on one hand, the economy of collectors and gatherers on the other. The first is assured by the man, the second by the woman. While the masculine group departs for a whole day to hunt, armed with bows and arrows, or works in the gardens during the rainy season, the women, armed with digging implements, wander with their children across the plain, and gather, pull out, pick, capture, seize [55] everything on their route that is worthy of serving as food: grain, fruits, berries, roots, tubers, eggs, small animals of all sorts. At the end of the day, the couple meets around the fire. When the manioc
● [252] is ripe, and as long as it remains so, the man brings a bundle of roots which the women pound and press to make a kind of pancake (uridnoeu, al). and when the hunt has been fruitful, they rapidly cook pieces of small animals by burying them under the burning cinders of the family fire. But for seven months of the year, manioc is rare. As for
[137] the hunt, it is most often a matter of chance in these sterile sands where a skinny small animal hardly ever leaves the shade, and the pasture lands at the heads of rivers are separated from one another by considerable stretches of semi-desert brush. Thus, the family
[24] must most often subsist on the collection of the women. Very often we have attended (and sometimes shared) these diabolical doll-size snacks which, for the Nambikwara, for half the year, are the only hope of not dying of hunger. When the man, silent and fatigued, re-
[262] turns to camp and throws his bow and arrows which he could not use to one side, from the basket of the woman is extracted an extraordinary and moving collection: some orange fruit from the buriti palm (e?eru, al, e?i?onde, bl, ?ola, c), two fat poisonous spiders (korafeu, al, kuti?nde, bl), some tiny lizards' eggs and some of these animals (kaiaterisu, al, nagede, bl, talime, c), a bat, some small nuts from the bacaiuva palm (arookesu, al, ko?eninde, bl), or uaguassu (aradikisu, al), a handful of grasshoppers (takedasu, al, tagese,
[252] bl, tasid, c). The pulpy fruits are crushed with the hands in a calabash filled with water, the nuts cracked with the blows of a stone, the animals and larvae buried pell-mell in the coals; and this repast is gaily devoured, a meal which would not be sufficient to satisfy the hunger of a white person, but which feeds a family here.

595
601

sense of this term remains doubtful. And it has never been possible, in the course of the questions on kinship, to obtain from polygamous husbands discriminating terms for each of their wives.

595
462
252
263

established between the first wife and the new arrivals. The first wife takes care of her children and devotes herself to the cares of the household, shredding the manioc and cooking the cumaru nuts. She is occupied with feminine craft tasks. In short, she carries on her activities within the [61] limits of the sexual division of labor. The other wives aid her occasionally, but their main duty seems to be to assist their husband in his masculine tasks. They are comrades and collaborators who, in the general plan of the division of labor, could be more justifiably claimed with the men. Their aid seems like a method on the part of the chief of the group to fulfill his heavy duties more easily, and like a psychological compensation for his responsibilities. When he leaves on a hunting or reconnoitering expedition, one of his polygamous wives accompanies him to hold his arrows and to carry in her basket the eventual prize. When he works around the camp or in the village, it is with their aid and company. Although men and women do not bathe at the same time, one sometimes sees the husband and his polygamous wives take a bath together, the pretext for great struggles in the water, and innumerable jokes. In the evening he plays with them, either amorously, rolling in the sand embracing two, three or four, or in a childlike way. For example A1, a3 and a4, stretched out on their backs, by way of making a star with three points on the ground, raise their feet in the air and knock them against one another, bottom of foot against bottom of foot, in a regular rythm (this game is described by the term eridnaikitiu, a1).

[515]
[832
524]

595
182

The polygamous union is thus presented as a super-imposition of a plural form of amorous companionship on the monogamous marriage, and at the same time, we insist, as an attribute of command with a functional value from the psychological point of view as well as from the economic. The women usually live on very good terms, and although the first wife has a role that might seem a little unappreciated, working while she hears at her side the bursts of laughter of her husband and of his little mistresses, and sometimes even witnesses more tender frolicking, she does not show either bitterness or jealousy. In fact, this distribution of roles is not either unchangeable or rigorous, and, upon occasion, although rarely, the

1. She wears no decoration or ornament;

[107] 2. She does not touch food, neither to harvest it, to gather it, to prepare it nor to cook it;

3. She speaks to no one and no one says a word to her;

4. She avoids groups and when curiosity draws her toward our circle, she attends the distribution and exchange of gifts from a distance and in silence. If someone gives her or her husband a present (for example some beads), it is immediately given to the baby;

5. Every day she receives her food from her mother (a18), who gives it to her without speaking, and occupies herself with certain cares of the baby such as delousing it;

6. She does not bathe in the river, but washes herself with the water which she herself goes to draw in a gourd;

7. She goes away with her husband, sometimes for whole days, and, upon departure, follows him at a distance without saying a word; on these occasions, she takes the baby along.

A21 behaves similarly:

1. He does not go with the masculine group when they go hunting or gardening;

2. He rarely goes away, and then with his wife. The rest of the time he spends stretched out without taking part in any creative activity; they say he is ill (inkaltu);

3. In the degree to which he and his wife perform the most [143] indispensable activities, there is no division of labor between them. Either one buries the baby's excrement, or places in the coals the manioc received by a22 and a18 which constitutes their sole nourishment. Both are extremely thin, and appear very weak; their hair has not been cut or washed for a long time.

Toward June 20, 1938, this behavior was modified. For three consecutive days A21 and a22 disappeared for the whole day, doubtless to hunt, for, after several fruitless trips, they return (June 23 at 15 o'clock) with the following small game:

a. An irara (Mustela sp.);

b. Three bats;

c. Two lizards and their eggs.

The irara and the bats have already been put over the flame to burn off the hair. a22 begins immediately--and for the first time--to clean and crush a small quantity of manioc and she quickly puts a cake under the coals. At the same time she puts the broken lizard eggs there, and [108] takes them out barely cooked; she divides

846 252 them between herself and the baby. For the first time, she exchanges some words with her neighbors while laughing.

846 252 224 In the meantime, A21 has cleaned the irara. He gives the stomach, the large intestine, the small intestine to a2 (wife's sister); she, aided by her daughter a5, cleans the intestines, puts them on to cook and begins to eat them with a5 and a3.

A21 cuts the tail of the irara, cooks it rapidly, and eats it with his wife and baby.

The three bats have been given to a2 (wife's sister) and a1 (sister), who divides her lot with her son A16 and her son-in-law A15. a22 cooks the lizards and the organs (liver, heart, lungs, spleen, kidneys of the irara). She gives the whole thing to her husband, who gives a piece of liver to the baby and divides the rest with his wife.

All of these operations are carried out very rapidly in a sort of hurry, and are finished at the end of a half-hour. At 30 minutes past 15 o'clock, a22 lights a different fire from the one that each household uses, and places the irara there. She then goes to take her first bath in the river, and brings back some water in a gourd to wash the baby. Toward 16:15 the cooked irara is taken from the fire by A21. At this moment everyone has returned to camp and has taken his habitual place. A21 and a22, seated near the new fire, occupy a central position. A21 cuts the irara into five pieces and divides it among the members of the family, as was said previously. (1)

1. Cf. above, p. 74 f.

From that time on, A21 and a22 take up normal activity and are no longer distinguished from their companions.

846 Thus the period of abstinence is characterized by relative isolation of the couple in question, which is at the same time under a certain number of taboos (social contacts, baths, preparation of food, dress, eating of certain foods). It ends at the moment when the child takes its first meal not consisting solely of milk (in this [224 case the lizard eggs and the irara liver. This meal is part of a hunting 842] feast offered to the group by the parents who up to now were under the taboo. However, the atmosphere in which these operations are carried out merits attention. No solemnity surrounds them, and the parties concerned perform them with the same routine and nonchalance which characterizes daily activities. It is not a question then of a ceremony with the psychological implications which this term carries, but of a collection of acts which must be done, and are done, with a minimum of attention accorded to their exceptional character.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

When rains come, the *Nambicuara* settle in temporary villages, and the men open circular gardens in the gallery forest by burning and felling the trees with stone (now steel) axes. They till the soil with pointed sticks and raise both bitter and sweet manioc, several kinds of maize which are different from those of their more civilized neighbors (Roquette-Pinto, 1938, p. 297 n.), beans, gourds, cotton, urucú, and a variety of small tobacco with tiny leaves. Despite the difficulty of fishing in the deep, clear tributaries of the Juruena River, they have moderate success using fish arrows, basket traps, and a drug made of a vine.

Food preparation.—Game is usually only half cooked in hot ashes, but it is sometimes smoked on rectangular or pyramidal babracots. Manioc is grated on thorns of the catinal palm (*Iriartea* sp.) imbedded in palm wood planks. To remove the poisonous juice of bitter manioc, the pulp is either squeezed in a strip of bark twisted spirally or buried for several days to allow the juice to drain off. Balls of the pulp are then sun-dried and packed in leaves in baskets or buried at marked places. In times of scarcity, perhaps months later, the half-rotten balls are made into flat cakes, hastily cooked in hot ashes, and eaten.

The *Nambicuara* cannot bear to eat salt, which they do not know how to prepare, or pepper, which they do not cultivate. Even hot food is cooled with water before it is eaten. Wild honey, too, is diluted with water. The only condiment is a variety of cumarú bean which has a strong, bitter almond taste. It is boiled in pots; afterward the liquid is drunk and the beans are mixed with food, especially with grasshoppers crushed in mortars. Armadillo meat is often ground with maize flour.

Domestic animals and pets.—The *Nambicuara* have many pets, especially monkeys, coatis, parrots, and birds. Domesticated animals were unknown until the Rondón Commission introduced chickens and dogs. Although at first extremely afraid of dogs, the Indians quickly adopted them and treated them with the same deep affection they show all their tame animals. Even now they are terrified by oxen seen at telegraph stations, and call them by the name given to the deadly spirits of the water and the bush. They do, however, hunt and eat horses and mules as if they were wild game.

HOUSES

The surprising variety of house types suggests recent borrowing from neighboring tribes. The *Nambicuara*, like the *Siriono*, may formerly have lacked houses entirely. During most of the year, even at the present time, they build only scanty temporary shelters for a single night. These consist of branches of palms stuck into holes dug in the sand to form a half or quarter circle on the side from which the sun, the wind, or rain are expected (pl. 37, *center, left*). Each individual family builds its own

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

ties down to their smallest details. There is, undoubtedly, a function in chieftainship. This can, however, be reached only through analysis as the underlying principle of the institution. In other words, the differing structure of the digestive organs in man, ox, fish and clam do not point toward different functions of the digestive system. The function is always and everywhere the same, and can be better studied, and more fully understood where it exists under a simple form—for instance, in a mollusc. Similarly, and as Professor Lowie once wrote, if anthropology is to be considered as a scientific study, its subject matter cannot be individual cultures, but culture taken as a whole; the rôle of individual cultures being to offer, according to their own characteristics, special angles from which the basic functions of culture, although universal in application, can be more easily reached.

This will perhaps help us to eliminate preliminary questions which otherwise could have proved very difficult. Anthropologists in South America and elsewhere have been eagerly debating the question of whether these South American tribes—nomadic, relying mostly on collecting and gathering, with little or no agriculture, little or no pottery, and, in some cases, with no dwelling other than crude shelters—should be considered as truly primitive and as having preserved their exceptionally low cultural level through tarriance, or whether they did not previously possess a higher type of social and material organization and have regressed to a pseudo-archaism under unfavorable circumstances. The Nambikuara are one of those tribes which, along with the Siriono, on the other side of the Guaporé valley, the Cayapo, Bororo, Karaja of central Brazil, the so-called *Gé* of Central and Eastern Brazil, and some others, together form a kernel of primitiveness surrounded, in the West, by the higher tribes of the upper Amazon, the Bolivian plain and the Chaco, and from the Orenoco's to the La Plata's estuaries, by a coastal strip inhabited mostly by the Arawak, Carib and Tupi-Guarani linguistic families. An independent linguistic stock divided into several dialects, the Nambikuara seem to display one of the more backward cultures in South America. At least, some of their bands do not build huts and are wholly ignorant of pottery and, even among the others, these two arts are exceedingly poor. There is no weaving, except for the narrow arm and leg bands which are made of cotton; no dress whatsoever, either for the men or for the women; no sleeping contrivances, such as hammocks or platforms; the natives being used to sleeping on the bare ground without the protection of blankets, mats or hides.

The Wakitisu do not
323 make pottery, but they sometimes acquire pots from the Paresi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakitisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following [482 and carrying a burden basket on her back and a 858] baby strapped on her hip, an older child following her. As they move slowly along they collect 222 fruits, nuts, insects, snakes, ants, lizards, rats, wild honey, and a great variety of grubs or larvae. 226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them [252 catching fish that were only 2 inches in length. 262] These were later thrown on hot coals and eaten 223 without being cleaned. Small birds no larger 222 than a sparrow are shot if the man can get near [314] enough to use his bow and arrow. If they come to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it 313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally [177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

224 with them and informs the flanking hunters with bird calls. When completely surrounded the flanking parties drive the pigs back against the central group where the best archers are stationed. As the pigs charge back, they are shot at close range. Usually an arrow will stop a peccary so that it can be killed later with a club. If the hunters are well organized very few peccaries escape.

252 The hunters then open up all the pigs and take [264] out the viscera. The entrails are emptied and along with the heart, liver, etc., are thrown on hot coals to broil and are eaten on the spot. [442] When opening an animal the hunter grasps a handful of skin over the belly and cuts it off with a bamboo knife leaving a round hole through which the viscera are drawn out. After everyone has eaten, the carcasses are carried back to camp where the meat is cut up and shared among the families, the man with a large family getting more than one with a small family even though the [251] man had not shot anything. All meat that cannot be eaten in a day or two is cut up and dried.

224 The Nambicuara now have a few dogs which [231] they use when hunting jaguars. The dogs drive the jaguar into a tree where it can be shot with a gun or with arrows. Sometimes a wounded jaguar will attack the hunters, and injuries occur. Marciano's 6-year old son had his head and face clawed by a wounded jaguar which his father was not able to kill with the first shot of his shotgun.

Armadillos are dug out of holes. The soil is first loosened with a stick and then dug with a gourd, the diggers sometimes having to go as deep as 8 feet. When they get near the armadillo they put a long stick under it and force it up against the top of the hole in order to prevent it from digging further. When near enough a man reaches into the hole with his hand and pulls out the armadillo. If the hunters are very hungry [264] they will roast the armadillo on the spot, taking left-over pieces of roasted meat home to their families.

224 Although sharing is the custom, and it is amus-
264 ing to observe several men sitting around a 6-inch lizard to eat it, single hunters sometimes succeed in avoiding their obligations. One day as I walked along with Cascudo, followed by several Nambicuara some distance behind, he killed a snake and threw it into the bushes and signaled

226 Xingú, the Nambicuara timbó fishing appears very elementary. The small fish are wrapped in [252] leaves and placed in hot ashes until cooked. Large fish are broiled on a babracot. The Nambicuara also claim that they fish at night with [177] torches along the river banks. This method may have been taken over from the Brazilians.

AGRICULTURE

241 The principal food crops grown by the Nambicuara are bitter manioc, sweetpotatoes, arrowroot, cará, maize, beans, and peanuts. To this list we must add such nonfood crops as cotton, tobacco, urucú, and gourds. The scientific and native names of these plants are listed in Appendix 1.[1] In more recent times they are known to produce sweet manioc and sugarcane. The dependence upon food crops in relation to game, fish, and wild food plants is difficult to gage. The statements of missionaries, however, appear to indicate that cultivated crops do not provide a year-round food supply and may actually play a minor role as compared with dependence upon noncultivated resources.

Farming is done on the slopes of the "galeria" forests, where, as we have seen, they also do most of their hunting and collecting. The Wakitisu band clears and cultivates a single field and, as we have said, lives in a single house while thus occupied. In the past the field (*kaitsu*) was [177] cleared with a stone ax (*stáwu*) and a wooden club (*kakutáwisu*). Today steel axes and machetes are used, but the method of planting is still the same. The efficiency of steel tools over stone axes and wooden clubs is indicated by the statement that in the past when a new field had to be cleared the people had to work during most of the wet season in order to fell the trees, a task which they now perform in May and June.

Formerly the light undergrowth was pulled out by hand and the bushes and saplings were beaten down with the wooden club. The Nambicuara 241 had a unique way of felling trees. Starting near 313 the bottom of the slope, they cut all the small trees part way through, then selected a number of large trees as kingpins. When these large trees were felled they knocked down the smaller trees below them. This was continued until they had a circular clearing of the required size on the slope. 241 Today the clearing is done with axes and knives,

[1] [Cal-116, pp. 121-126.—Ed.] [p. 90 (B)]

252 The Nambicuara method of processing manioc in comparison with that of the Camayurá is simple and crude. The following describes the method used today: Marciano's wife dug up a burden basket full of manioc from a field belonging to the Protestant Mission. She sat under a tree and peeled the tubers with an old butcher knife (formerly a piece of bamboo was used). She washed the peeled tubers and placed them in a calabash. She then took a grater made from a piece of kerosene box about 2 feet long and 6 inches wide to which an 18-inch strip of perforated tin was nailed. She placed one end of the grater in a larger copper basin (belonging to the mission) while the other end rested on the edge, and while steadying the grater with one hand she grated the tuber with the other. The tubers did not stand in water nor were they dipped in water during the process of grating.

[171]

After the tubers were grated she dipped out a calabash full of mash and began pressing it with her hands and pouring the juice into another calabash. After she had drained off as much juice as possible she picked up a handful of mash (*wiñaxe*) and rolled it and squeezed it until no more juice could be expelled. This ball she placed in another calabash and continued making balls until the calabash was full. She then patted down the balls to form a round loaf about 10 inches in diameter and 4 inches thick, which she set out on the bare ground to dry in the sun. After several days in the sun these loaves get hard and dry and form the storable product (*kisokónyare*) from which the edible cake *hi'taíre* (also called *walónaxa*) is baked. The juice (*eyéwaz*) which was left in the calabash she poured into a slight depression in the ground, and after the liquid had drained off she collected the thin film of starch flour (*akuñwiw*) along with some sand, rolled it into a ball, and placed it in hot ashes to bake. The lack of pottery vessels prevents the Nambicuara from saving and boiling the juice. They know, however, that the juice is valuable, and when they have cooking vessels they boil it to form a thick porridge.

[251]

[415]

When the Nambicuara wish to prepare a greater quantity of pulp they use a piece of bast for a press. This is a piece of embira bark about 3 feet long and 8 inches wide called *sáwa*. A woman rolls a ball of pulp in the strip of bark and twists the bark until the pulp is dry. The balls are then

252 placed on a platform under which a fire is lighted. In this manner large quantities of *hinokényre* can be prepared in one day.

When a woman gets ready to bake a manioc cake she pushes the hot coals and burning wood to one side and pats down the hot bed of the fire with a flat piece of wood. She then breaks off pieces from a dried manioc loaf and crumbles them over the bed of the fire by rubbing them in her hands. When she has crumbled up enough dry manioc, she pats down the flour to form a round, flat cake about 10 inches in diameter and from 1 to 2 inches in thickness. She covers the cake first with hot ashes and then hot coals. After one-half hour she uncovers her oven to find a brown cake covered with ashes and cinders. This sour, dirty, gritty product in no way compares with the fine-textured, sweet *mungó* of the Camayurá, the meal for which is prepared by crushing the dry loaf in a mortar, then sifted to remove the rough fibers, after which the flour is dampened and baked on a pottery baking plate. Sometimes the whole manioc loaf is placed in the fire, and as it bakes the Nambicuara begin to break off pieces from the outside. For ceremonial purposes they bake cakes about 2 feet in diameter.

241 Toward the end of the rains in April and May the Nambicuara return to their fields to enjoy the fresh garden products. The harvest is inaugurated with a harvest ceremony (*hoikónak-idutsu*). [262] Fresh maize, peanuts, and sweetpotatoes are [252] roasted, manioc cakes are prepared, and, if possible, manioc juice is boiled to make chicha. These garden products, along with meat, supply the food for the feast, which lasts for several days. [534] The sacred flutes (*uséarku*) are played in the flute hut, the spirits of the ancestors are present, and food and drink are offered to them.

221 The subsistence activities of the Nambicuara are, thus, closely associated with the annual cycle of growth in which agriculture forms but a part. The dependence of the Nambicuara upon the wild products of the forest and plateau are much more complex than has been indicated. They supplied long lists of names of plants, insects, and animals for which no Portuguese names could be found. A full understanding of their economic dependence upon the environment would come only by someone following a band of Nambicuara throughout the year to observe the complete annual cycle of

4: Oberg E-5 (1949) 1953
SP17 Nambicuara SP17

subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A favorite dish is to crush in a mortar manioc cakes with boiled beans, broiled meat, ants, palm nuts, monkey and bird bones.

As an example of the variety of uses to which the Nambicuara can put a plant we can take the buriti palm: (1) They eat the pulp surrounding the scaly covered nut. (2) They use the fibers from the new growth to make twine. (3) They use the tough, flexible cortex of the frond stalk for making baskets. (4) They fell the buriti so that a certain variety of grub can collect and multiply in the starchy pith in the heart of the tree. The grubs or larvae they then eat uncooked. (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buriti palm has male associations, for only men can prepare its products. When a male child dies a piece of buriti fiber is left over his grave.

The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 18 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick kicks into small smouldering balls. These he places into a handful of dry buriti fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

The material equipment of the Eastern Nambicuara is extremely simple. Many items, such as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small grater and the few gourd vessels, small baskets, and twine, the woman carries

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

411 (1) The *kéepare*, an arrow which is used for [223 224] shooting monkeys and large birds, is made by lashing an inch-long slender barb of aiéva palm or pirva about an inch back from the sharpened point of the foreshaft.

[227] (2) The *saiáiwa*, or fish arrow, is made by lashing four slender points of wood about 2 inches long to the end of the foreshaft. This arrow need not be feathered. Today wire is sometimes substituted for the wooden points.

[225] (3) The *dáakiwa*, or blunt bird arrow, used for shooting small birds, has a separate pirva foreshaft, the end of which forms a rounded flat surface about an inch in diameter.

[224] (4) The *képtiwa*, or big game arrow, has a broad split bamboo point about 12 inches in length which is lashed to the foreshaft. As the bamboo point is slightly grooved along the center, the foreshaft lies along the groove permitting it to be lashed firmly to the tapered sides of the point. Formerly curare poison was smeared along the groove. This was also the arrow used in war.

Sometimes a bamboo point is serrated on one or both sides. In former times, this arrowhead was poisoned with curare. It was attached loosely to the shaft so that when it struck an animal it became detached from the shaft. This arrow was used against big game like the jaguar, tapir, deer, and against human enemies.

The bow is held in a vertical position when shooting; the arrow is held with the thumb and forefinger while the middle and ring finger pull the bowstring, with the arrow resting against the hand side of the bow.

283 Cordage is made from the fibers of the tucum and buriti palms and from cotton. The tucum [306] palm (*Astrocaryum tucuma*), *kaiáiwa*, provides not [295] only fiber but the hard shell of the nut is used for making the black, round, flat necklace washers, and the thorns from the trunk are used as spikes in the manioc grater. Tucum twine which is a little stronger than buriti twine is used for bowstrings, for stringing beads, and for many other purposes. When a man needs tucum twine he sends his wife to gather the palm leaves. As the young trees grow in clumps, it is a simple matter for the woman to cut off a number of fronds. The women then take a long slender leaf, bends it double in the middle so that the woody fiber breaks, then doubles it back and pulls downward

844 is buried in the camp. The child is bathed, and
tiny washers made of tucum nut hull are placed
[304] on its ear lobes. The washer or ring is cut on
an angle so that the two points eventually press
through the lobe creating a hole. As the child
grows, new washers are added. After a few weeks
[551] the child is given a beaded necklace, but it is not
named, being known only as the child of so-and-so
until puberty, when it receives a name. The
Wakitênes appear to have no avoidances following
the birth of a child, although the Kitâuhix are
[845] said to practice a modified form of couvade.
Twins are accepted with satisfaction. Illegitimate
[848] children are likewise accepted and are cared for
by the girl's parents until she marries. No stigma
appears to be attached to an unmarried mother;
however, this attitude may be a recent develop-
[845] ment. Crippled or malformed babies are not
[847] killed, but usually die shortly after birth.

Children are nursed until they are 2 or 3 years
853 old or until another child is born. Women in the
band assist one another in nursing and taking
care of the infants. If a woman should have two
small infants, another woman who has lost her
854 child will nurse one of them. Small children are
carried on the hip of the mother, sitting on a
strap which passes over the opposite shoulder of
the mother. This strap which is made from
embira bark or woven cotton is about 4 inches in
width. Women evidently are accustomed to
carrying heavy loads, for on many occasions the
tiny women were observed carrying not only their
child but also a huge burden basket full of fire-
wood. When the child gets a few teeth it begins
to chew on a piece of broiled meat. One morning
while Kacro and I were debating what to do with
a rat which we had caught in a box trap the
night before, neither of us having the courage to
put our hand in the box, one of the missionaries
suggested we give it to the Nambicuara. Kacro
then carried the box over to Julio's camp and gave
853 it to one of his wives. Without any hesitation
the woman put her hand in the box, pulled out
252 the rat, banged its head on the box, and threw it
on the coals of her fire. After the hair had been
partially singed off she pulled it out, cut off its
tail with her thumb nail, and gave it to her
cowife's baby, who began sucking on it as if it
had been a piece of candy. Then with her thumb

853 nail she opened the rat and threw the viscera and
252 the rat on the coals. Within 15 minutes that rat was eaten, entrails and all, while Kacro and I looked on in a state of horrified fascination. [862] Children thus begin by eating broiled meat and fish; pieces of sour, gritty manioc cake are given to them at a more advanced age.

PUBERTY

881 When a boy reaches the age of 14 or 15 he has
[304] his upper lip and the septum of his nose pierced with a sharpened fibula of a monkey ("macaco-prego"). One man holds the boy's arms, another his head, while an older male relative performs the piercing. Small plugs of bamboo are then placed in the holes. The following night the shaman leads the band in singing and dancing. Food is prepared in large quantities and offerings are made to the ghosts who are believed to be present [553] at the ceremony. The boy is now given a name which he will keep throughout his life. If the boy's father is dead he will use his father's name. If the father is alive he will use the name of some dead member in his grandfather's generation. In this way names are passed from one generation to another. An important part of the boy's puberty ceremony is the ritual beating administered by the old men of the band. He is now permitted to take part in the singing and can be present when the sacred flutes are played in the flute hut. Although this creates an attitude of obedience to the older men, he still continues to be abusive toward the women of the band. His unmarried female cross cousins now begin to notice him and openly show their desire to go hunting with him.

The puberty ceremony for girls is much more elaborate. After a girl has her first menses her father builds a small hut in the center of the camp, in which the girl is secluded. She must remain in this hut day and night and is attended by her female relatives. The chief then calls all members [202] of the band together, even sending messengers to distant hunting parties. When the band is united the chief organizes a hunt in which all the men take part, and they must remain away from the [251] camp until the moon is full. While on the hunt they accumulate a great quantity of smoked meat. When the moon is full, the men send a messenger to the camp to whom the women give some of the

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéro, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákoré and Cuihanierê to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guaycurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoákoré, and who, as now stated, are Nhambiquára. This name of Uáikoákoré is given by the Parecí of the sub-tribes Kazinitê and Uainaré of the rivers Arinos, Sacuriá-iná, Tabaris-iná and Timalatiá to their kindred of the Kozirini group who inhabit the upper parts of the Rio Verde, the Juba, Caboçal and Jauru. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of coconut. They wear armlets, bracelets, leg ornaments and head collars made from the fruit of the mbacáiba. They live by the chase, but also plant maize, yams, potatoes, mandioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atziri and the Amúsas of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Késhbé of the Parecí, made from pounded mandioc. The native *breu* or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Oanini and wax, and is preserved in leaves of the Malá-malá palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutum feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 90 to 2m. 38 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malá-malá and bees. The upper disk has three orifices.

Fig. 88. Mortar of the
Serra do Norte Indians

The external layers cover the whole building, like very precise and well clipped sheets of straw. The side walls are not distinct from the roof, but mere extensions of it.

Of the two houses we have described, in the village close to the Carumi (or Festa da Bandeira) River, the larger covers 30 meters in circumference, the other 28. Their doorways measure 0.37 meters in width by 0.52 meters in height. These two houses stand on a plaza some twenty meters in diameter.

Inside the huts stand three bamboo grids (giraus) to dry manioc scrapings, and two enormous black pots which could not have come through the doors; lighter utensils and various other implements, as well as ornaments, are kept in the ceiling thatch. This serves as the Indians' closet, where they hide their smaller belongings. [Fig. 24]

A small fire burns underneath each grid.

These grids were made up of four bamboo stalks sunk into the ground and supporting a horizontal grate of small bamboo reeds. They measured about two meters in length by one and a half in width.

The huts are not equipped with any smoke holes, and none are needed. The smoke of inside fires filters easily through the interstices of the thatch.

Around the dwelling, scattered or in heaps, lie disjointed bones, fragmented cocoanuts, pods of the jatobá bean, corn cobs, charcoal, and food refuse, mixed with worn-out tools and utensils.

In the village on the Festa da Bandeira River, I found beside a house a large object which I only failed to bring back because it would have been absolutely impossible to transport it. It was of a kind commonly found in the sambaquis [224] of the Atlantic coast: a rock pitted with several depressions large enough to hold a fingertip. To one side lay a prodigious quantity of small bacaba nuts, both shelled and unshelled. It has often been inferred that this implement was used to produce fires, but in the Serra do Norte it merely serves to shell palm nuts. This stone, however, was much larger than those generally encountered in the sambaquis.

The temporary shelter consists of a screen of leaves and branches. The Indians may use it for a few days if hunting in the area is good; then they abandon it.

[Fig. 18]

241 They subsist chiefly on the produce of husbandry; the development of agriculture in their backward milieu [229] constitutes one of the paradoxical traits of this tribe.

242 As a general rule, it may be said that the Nambicuara eat of everything; unlike some other Indians, they do not shun certain species of animals. A mosquito that lands on their body, a louse, a locust, a small lizard that scampers by--nothing is spared.

[252] Some of them carry sticks to kill any snakes they may encounter; they roast them in the embers and eat the delicacy with pleasure.

After roasting their catch, they discard only the stomach.

At the camp on the Primavera River, whenever one of them was hungry he would run off into the bush and return with a live calango [a small lizard]; after beating the head of the little animal against a piece of wood [230] he would throw it into the hot ashes. Later he would tear open the animal's abdomen with his nails, remove the stomach and enjoy the rest. On another occasion, the Indians caught an armadillo and killed it by twisting its neck.

In hunting and fishing they use arrows that will be described later.

252 They prepare the eggs of the wild duck (Cairina moschata, 242 L.) by nestling them in shallow depressions in the embers after [243] turning them on a diminutive spit stuck through a small hole punched in the shell.

The meat of large game--deer, paca (Coelogenis paca), [225] capybara (Hydrochoerus capybara)--is utilized only after it has been pounded in a mortar or beaten between two pieces of wood.

[Fig. 19]

264 They cut off large pieces with their nails, with their teeth, and sometimes with knives of wood or bamboo. No sooner have they gulped down what is in their mouth than they suck their fingers, clucking their tongue noisily.

251 The Tagnani are familiar with the preserving properties of smoke; the meat we handed out to them was not all eaten on the same day. They hung the remnants on the barbecue [moquém].

252 The Cocozu do not use a barbecue; they roast their meat in the embers. The quantity of ashes they swallow with the roast is considerable.

[Plates p. 230.]

[231] The Tagnani and Tawite build a characteristic type of barbecue. They set up four stakes which they connect with four crosspieces; between these they place two sticks to hold the pieces of meat.

[Fig. 23]

[278] 262 They drink honey mixed with water (hydromel). They like young bees, which they eat with the honey and wax.

They do not allow the maize to ripen, but eat it roasted when still green. Manioc is subjected to the same process, or it is used in 252 grated form to make cakes [beiju].

They press the gratings with embira cord and prepare very white pellets with the starch. To make the cakes, they open a cavity in the hot ashes of a fire and deposit in it a pellet of manioc dough which they smooth out with some piece of wood and with their hands. Then they cover it with ashes and embers; after a period of time which we do not know how they estimate, they uncover a large, roasted, sweet-smelling cake, somewhat sour, but which would be rather pleasant if it were not so covered with ashes and if it had not been prepared by such an unclean process...

[263 274] Green mangaba, (1) no sooner seen, is immediately plucked

1. Fruit of the mangabeira (Hancornia speciosa). (Ed.)

and placed in the embers. When roasted, it turns tender and pleasing to the taste.

From bacaba palm nuts the Tawite make a purplish mush [242] (uidniarê) which tastes like green leaves and which they relish. In order to prepare this uid-niarê, they pound the fruit of the palm and place it in water over the fire. This is actually a decoction.

273 We did not have an opportunity to observe the preparation of any fermented liquids. Yet the Indians make alcoholic beverages by

7:Roquette-Pinto--283 E-4, 5 (no date)1938 SP17 Nambicuara SP17
(ca. 1912)

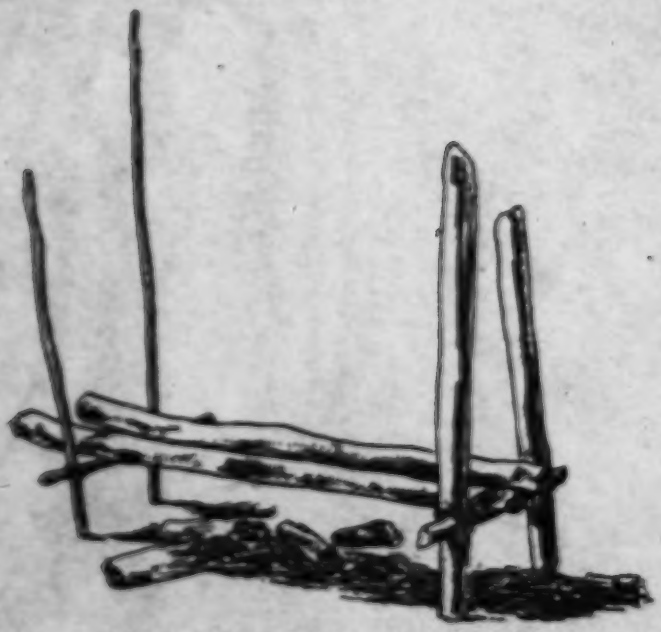

Fig. 25. Barbecue of the Tagnani and Tawite.

264 The children partake of a meal immediately; the women eat later... whatever is left over, if there is a leftover. This, by the way, is the rule even among civilized Indians... But in general, if there is plenty, each helps himself to whatever there is, when he wishes and as he wishes; the food belongs to all.

262 [236] They skillfully remove the gall bladder from the liver of the animals they devour, but they do not have a special name for it.

[252] Aarú is a cake which the Cocozu prepare by pounding up a whole roasted armadillo in a mortar until its bones are completely mashed, and then mixing it with manioc dough in the form of beiju.

[225] An upland rat (Scapteromys gnambiquarae, Miranda Ribeiro), which the Paressi call cólori, is prized by the Nambicuara as a delicacy. They call it arantacú.

241 They gather and utilize the produce of their husbandry from day to day. They have no special harvesting time, and no stores or surpluses except for the tobacco which they keep between two sticks hanging from the ceiling thatch.

251 There is always manioc dough in the house; it is the Nambicuara bread, which they eat with all their other foods. They keep the dough in large baskets lined with pacova (1) leaves.

1. A kind of banana. (Ed.)

[237] Leftover honey is kept in the gourd; it does not reach fermentation because the desire [to drink it] soon revives in some Indian...

261 We did not see any rite connected with food; but the soldier
[15] Gouveia, who was held prisoner in a Nambicuara village for six months in 1911, witnessed such a ceremony. The Indians of that village (which was named Urutau) had killed a large tapir. (1) This was
[178]

1. Tapirus americanus, fairly abundant along the rivers of the area. Hard to catch because very wary.

[the pretext for] a feast. They dragged the animal to the village plaza. Then the men went off into the bush to gather branches with

226 Tephrosia toxicaria is a poisonous legume, a kind of tingui
[Lapinus cascavella] used in fishing.

278 They are not familiar with the fishhook, and use [278: full page of figures] [277] a sort of fish trap made with bamboo or with the stem of the titara liana (Desmoncus sp.).

262 The following foodstuffs are represented in the collection.

--Guaiatê: white maize.

--Urinodzu: manioc dough, which under microscopic examination proved to be very rich in starch grains. The root, once grated, is pressed [by wringing] with a straw cord, the çaaru. (1) The grater

252 [415]

1. [Heloisa Alberto Torres notes that the cylindrical tube used to press manioc by some Amazonian tribes must have spread from the Guianas to the valley of the Amazon. Métraux considers the woven band used for the same purpose and found on the periphery of the tube territory a more primitive form. The simple straw cord of the Nambicuara would thus constitute an even more primitive variant.]

is of the type used by the Xingu Indians (Suyá, etc.). It consists of a board with about two [twenty?] rows of small sticks.

[Fig. 17]

262 --The larvae of a butterfly, which they eat alive.

--Katumuzú: anthill clay, which they also eat.

. . . . . .

[628] --A mushroom, orelha de pau (Polyporus sp.), which is eaten, and beans (Phaseolus sp.) of unusual aspect were also found in one village. [278] The smoked [moqueada] head of a great anteater was

[251] found in a basket by Miranda Ribeiro during the 1909 expedition.

415 Mortars (mutêne) are hollowed out by means of fire and used to
252 pound meat and other foods.

[Fig. 70]

177 Their plaiting follows patterns clearly characteristic of the [223] Xingu (Trumai and Nahuqua) and gives proof of contact with those backward tribes which the rudimentary culture of the Nambicuara had already implied.

[252] The quadrangular barbecue, which differs from the usual pattern, is used only by the more advanced groups (Tagnani, etc.); it recalls the barbecue of the Javahe as depicted by Fritz Krause. (1)

1. F. Krause, In Den Wildnissen Brasiliens [In the Brazilian Wilderness] (Leipzig, 1911).

[201] The straw ornaments of the Nambicuara are quite similar to 197 those of the Suya. But linguistic affinities are even more indicative of contact between the two groups. No other people speaks a dialect [310] so similar to that of the Nambicuara in terms of word morphology, although the two languages are otherwise quite different.

171 It is interesting that a spontaneous affinity should arise be- 177 tween two remote and equally primitive tribes, the Guayaki of Paraguay and the Nambicuara of the Serra do Norte, from their common use of the jaguar hide helmet.

However, I am inclined to believe that the latter copied it from their neighbors, the Cayabi of the Parananinga River, who use helmets of the same material.

178 Unfamiliarity with the banana tree and with the pipe (an ob- 171 ject frequently encountered in North American mounds and Brazilian sambaquis) indicates how long the Nambicuara have been established in their mountain range.

Recognition of the Ge-Botocudo group as one of the oldest representatives of aboriginal South American populations is no longer a matter of dispute. . . . .

171 [311] There is no doubt, in my opinion, that the [Brazilian] linguistic groupings correspond to ascending stages of civilization [312]. . . . . The Serra do Norte is inhabited by a people of Ge culture evolving toward the Nu-Arawakan culture, of which they have barely reached the initial stages.

/216 cont./

224 278 911 [309] The poisoned arrows are intended for hunting certain animals, some large birds, cervids, and especially monkeys. Birds wounded by one of these arrows fall almost immediately.

A monkey mortally wounded with an ordinary arrow or even a bullet often remains hanging from the branches. Under the action of curare it holds itself immobile at first, then begins to tremble and falls several minutes later (five to 10 at the most) as soon as paralysis is produced.

A peccary or small deer such as the Cervus campestris wounded in the body runs for one or two minutes, then stops exhausted, is attacked by tremors and lies down.

The tapir, very large, resists a long time; it can run for two hours before stopping; hence the Indians do not hunt it with curare.

[362] [263] /217/ The meat of animals killed with curare may be eaten without harm; the Ñambikwara of the Juruena content themselves with cutting away the flesh around the wound impregnated with poison and colored yellow; the Çabanê do not even take this precaution.

279 911 726 Poisoned arrows are also used for war; this is perhaps their principal object among many Ñambikwara groups, who possess only a very few specimens during normal times.

None of the Indians know of an efficacious antidote. According to our informants wounds in the trunk would always be fatal to men. By immediately drawing out the arrow, it might be possible to survive a wound in a limb; in order to make their extraction more difficult, the points of the poisoned arrows, especially those of the Çabanê, are very lightly attached to their shafts.

593 of the couple among the Nambikwara. It is the economic and psycho-
593 logical unit par excellence. Not only among errant bands which are
182 made and unmade unceasingly does the couple appear as the only
762 stable reality (at least theoretically), but it is the couple alone which assures the subsistence of the members of the group. The Nambikwara live under a double economy: the economy of hunters and gardeners on one hand, the economy of collectors and gatherers on the other. The first is assured by the man, the second by the woman. While the masculine group departs for a whole day to hunt, armed with bows and arrows, or works in the gardens during the rainy season, the women, armed with digging implements, wander with their children across the plain, and gather, pull out, pick, capture, seize [55] everything on their route that is worthy of serving as food: grain, fruits, berries, roots, tubers, eggs, small animals of all sorts. At the end of the day, the couple meets around the fire. When the manioc
[153] is ripe, and as long as it remains so, the man brings a bundle of roots which the women pound and press to make a kind of pancake (uridnom, aI). and when the hunt has been fruitful, they rapidly cook pieces of small animals by burying them under the burning cinders of the family fire. But for seven months of the year, manioc is rare. As for the hunt, it is most often a matter of chance in these sterile sands
[137] where a skinny small animal hardly ever leaves the shade, and the pasture lands at the heads of rivers are separated from one another by considerable stretches of semi-desert brush. Thus, the family
●[54] must most often subsist on the collection of the women. Very often we have attended (and sometimes shared) these diabolical doll-size snacks which, for the Nambikwara, for half the year, are the only hope of not dying of hunger. When the man, silent and fatigued, re-
[242] turns to camp and throws his bow and arrows which he could not use to one side, from the basket of the woman is extracted an extraordinary and moving collection: some orange fruit from the buriti palm (u2dru, aI, u[illegible]nde, bI, gola, c), two fat poisonous spiders (hoxalu, aI, ku[illegible]nde, bI), some tiny lizards' eggs and some of these animals (kazaherim, aI, nagade, bI, talime, c), a bat, some small nuts from the bacaiuva palm (arooleem, aI, ku[illegible]nde, bI), or uaguassu (aradikim, aI). a handful of grasshoppers (takedam, aI tagam,
[152] bI, tadi, c). The pulpy fruits are crushed with the hands in a calabash filled with water, the nuts cracked with the blows of a stone, the animals and larvae buried pell-mell in the coals; and this repast is gaily devoured, a meal which would not be sufficient to satisfy the hunger of a white person, but which feeds a family here.

274 It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

273 Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful [271] to those with open wounds or sores; the same pineapples, when green [257] are good for curing sores, for their juice eats away all the rotten and putrid flesh, and the aborigines know this; in such wise does this fruit [247] eat away, that they use its rind to wipe off the rust from their swords and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

263 The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

262 Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Azangça!"

261 One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

252 The children are given to eat of everything; no matter what 255 goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

278 Even the stimulants they use--tobacco, for instance--are shared 255 with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

[13]

1. Cf. E. Roquette-Pinto, "A condição da criança entre os indios do Brasil [The Status of the Child Among the Indians of Brazil," Primeiro Congresso Americano da Criança [First American Congress on Childhood] (Tucumán, 1916).

264 The children partake of a meal immediately; the women eat later... whatever is left over, if there is a leftover. This, by the way, is the rule even among civilized Indians... But in general, if there is plenty, each helps himself to whatever there is, when he wishes and as he wishes: the food belongs to all.

262 [236] They skillfully remove the gall bladder from the liver of the animals they devour, but they do not have a special name for it.

[252] Aarú is a cake which the Cocoau prepare by pounding up a whole roasted armadillo in a mortar until its bones are completely mashed, and then mixing it with manioc dough in the form of beiju.

[225] An upland rat (Scapteromys gnambiquarae, Miranda Ribeiro), which the Parecsi call cólori, is prized by the Nambicuara as a delicacy. They call it arantaçú.

241 They gather and utilize the produce of their husbandry from day to day. They have no special harvesting time, and no stores or surpluses except for the tobacco which they keep between two sticks hanging from the ceiling thatch.

251 There is always manioc dough in the house: it is the Nambicuara bread, which they eat with all their other foods. They keep the dough in large baskets lined with pacova (1) leaves.

1. A kind of banana. (Ed.)

[237] Leftover honey is kept in the gourd; it does not reach fermentation because the desire [to drink it] soon revives in some Indian...

241 We did not see any rite connected with food; but the soldier
[15] Gouveia, who was held prisoner in a Nambicuara village for six months in 1911, witnessed such a ceremony. The Indians of that village (which was named Urutau) had killed a large tapir. (1) This was
[18]

1. Tapirus americanus, fairly abundant along the rivers of the area. Hard to catch because very wary.

[the pretext for] a feast. They dragged the animal to the village plaza. Then the men went off into the bush to gather branches with

261 which they covered themselves, squatting in a circle beneath the leaves and singing all the while. After a long time they rose, and with the branches still tied to their backs they started dancing around their catch, which was later carved.

115 Unhappily, Gouveia was of an amazing inadequacy. He had lived among them, a captive, for six months; he had actually married an Indian woman, who had tried her best to teach him the language of her forefathers. Yet in the end he fled, bringing back only the vaguest sort of information such as the above, which nevertheless I have deemed proper to record here.

276 Of the stimulants customarily used by primitive peoples, tobacco is the most important [among the Nambicuara] aside from those alcoholic beverages which have already been mentioned.

I have stated earlier that they dry the leaves between two pieces of wood which they stick into the house thatch; when they wish to smoke, they take a leaf and crumble it between their fingers, rolling up the dust in another leaf plucked from a tree which the Cocozu call enandrú.

[238] They also keep tobacco by reducing the leaves to dust which they store in special gourds.

[Fig. 28]

[177] Prior to the arrival of the Rondon Commission, the pipe was unknown among the people of the Serra do Norte. Even today they do not like it and prefer their cigarettes, which are small and quite unlike the huge rolls of some Amazon tribes. (Fig. 30)

Their tobacco (Nicotiana tabacum) is mild and pleasantly scented. On journeys they always carry gourds filled with tobacco dust, or sticks with tobacco leaves; if they feel like smoking somewhere along the way, they stop and form a circle. They proceed as if they were about to have a meal and kindle a small fire. When the cigarettes are finished they continue on their way.

They are extremely fond of our roll tobacco, especially when made into cigarettes with pieces of newspaper...

271 The Indians of the Serra do Norte go naked. Both men and
184 women wear a straw cord around the hips. The Cocozu wear bands of <u>embira</u> around the wrists and upper arms, below the knees and

512 [514] on the ground in the position known by the name "aztec"—on their knees, the legs and feet flat on their inner side and the buttocks resting on the heels. Or else they cut, polish and file beads from nutshells or sea shells, earrings or other ornaments. And if the work bores them, they pick the lice from one another, stroll around or sleep.

512 521 During the warmest hours the camp is silent. The inhabitants, silent or asleep, enjoy the uncertain shade of the shelter. The rest of the time, the occupations are carried on with animated conversations. Nearly always gay and laughing, the Indians exchange jokes, and sometimes, with unmistakable gestures, obscene or scatological accounts which are greeted with great shouts of laughter. The work is often interrupted by mutual visits or questions; when two dogs or birds copulate, everybody stops and contemplates the operation with fascinated interest; then work is taken up again, after an exchange of commentaries about this important happening.

512 The children lounge around during a great part of the day, the girls surrendering themselves at times to the same jobs as their elders, the boys idle or fishing along a stream of water. The men remaining in camp dedicate themselves to basketwork, making arrows and musical instruments, and sometimes to performing some small domestic service. Complete accord usually reigns within the household. Toward three or four o'clock, the other men return from the hunt, the camp becomes animated, the conversation becomes livelier, groups form, different from family agglomerations. They eat yucca cakes and everything found during the day: fish, roots, wild honey, bats, little animals captured, and small sweet nuts from the palm bacaiuva (Acrocomia sp.). Sometimes a child begins to cry, quickly consoled by an elder. When night falls some women, chosen daily, go to collect or cut down in the neighboring woods the sure of wood for the [17] night. They can be seen returning in the twilight, staggering under the load which pulls the tumpline used for carrying it. To unload, they crouch and lean backwards a little, letting their bundle of bamboo rest on the ground in order to disengage the tumpline from their forehead.

512 In a corner of the camp the branches are amassed and each one supplies himself in proportion to his needs. The family groups form around their respective fires which begin to glow. The evening is passed in conversation, or else in singing and dancing. Sometimes these distractions are prolonged far into the night, but in general, after some amusements of caressing and friendly fighting, the couples draw closer together, the mothers clutch their sleeping infants to them, everything becomes silent, and the cold night is

593 of the couple among the Nambikwara. It is the economic and psycho-
593 logical unit par excellence. Not only among errant bands which are
182 made and unmade unceasingly does the couple appear as the only
462 stable reality (at least theoretically), but it is the couple alone which assures the subsistence of the members of the group. The Nambikwara live under a double economy: the economy of hunters and gardeners on one hand, the economy of collectors and gatherers on the other. The first is assured by the man, the second by the woman. While the masculine group departs for a whole day to hunt, armed with bows and arrows, or works in the gardens during the rainy season, the women, armed with digging implements, wander with their children across the plain, and gather, pull out, pick, capture, seize [55] everything on their route that is worthy of serving as food: grain, fruits, berries, roots, tubers, eggs, small animals of all sorts. At the end of the day, the couple meets around the fire. When the manioc
[253] is ripe, and as long as it remains so, the man brings a bundle of roots which the women pound and press to make a kind of pancake (uridnoom, al), and when the hunt has been fruitful, they rapidly cook pieces of small animals by burying them under the burning cinders of the family fire. But for seven months of the year, manioc is rare. As for the hunt, it is most often a matter of chance in these sterile lands
[137] where a skinny small animal hardly ever leaves the shade, and the pasture lands at the heads of rivers are separated from one another by considerable stretches of semi-desert brush. Thus, the family
[24] must most often subsist on the collection of the women. Very often we have attended (and sometimes shared) these diabolical doll-size snacks which, for the Nambikwara, for half the year, are the only hope of not dying of hunger. When the man, silent and fatigued, re-
• [262] turns to camp and throws his bow and arrows which he could not use to one side, from the basket of the woman is extracted an extraordinary and moving collection: some orange fruit from the buriti palm (e?ztu, al, c?z?nde, bl, ?ola, c), two fat poisonous spiders (kuraltu, al, kt??nde, bl), some tiny lizards' eggs and some of these animals (kat?terisu, al, nagãle, bl, tailtue, c), a bar, some small nuts from the bacaiuva palm (arookoom, al, kh?ninde, bl), or anguanu (arodikisu, al), a handful of grasshoppers (takedaln, al tagere,
[253] bl, tadld, c). The pulpy fruits are crushed with the hands in a calabash filled with water, the nuts cracked with the blows of a stone, the animals and larvae buried pell-mell in the coals; and this repast is gaily devoured, a meal which would not be sufficient to satisfy the hunger of a white person, but which feeds a family here.

595
601

sense of this term remains doubtful. And it has never been possible, in the course of the questions on kinship, to obtain from polygamous husbands discriminating terms for each of their wives.

595 established between the first wife and the new arrivals. The first
862 wife takes care of her children and devotes herself to the cares of
[252 the household, shredding the manioc and cooking the cumaru nuts.
● 263 She is occupied with feminine craft tasks. In short, she carries on her activities within the [61] limits of the sexual division of labor. The other wives aid her occasionally, but their main duty seems to be to assist their husband in his masculine tasks. They are comrades and collaborators who, in the general plan of the division of labor, could be more justifiably classed with the men. Their aid seems like a method on the part of the chief of the group to fulfill his heavy duties more easily, and like a psychological compensation for his responsibilities. When he leaves on a hunting or reconnoitering expedition, one of his polygamous wives accompanies him to hold his arrows and to carry in her basket the eventual prize. When he works around the camp or in the village, it is with their aid and com-
[515 pany. Although men and women do not bathe at the same time, one sometimes sees the husband and his polygamous wives take a bath together, the pretext for great struggles in the water, and innumerable
[332 jokes. In the evening he plays with them, either amorously, rolling
529 in the sand embracing two, three or four, or in a childlike way. For example A1, a3 and a4, stretched out on their backs, by way of making a star with three points on the ground, raise their feet in the air and knock them against one another, bottom of foot against bottom of foot, in a regular rythm (this game is described by the term eriéng(kitim, al).

595 The polygamous union is thus presented as a super-imposition
152 of a plural form of amorous companionship on the monogamous marriage, and at the same time, we insist, as an attribute of command with a functional value from the psychological point of view as well as from the economic. The women usually live on very good terms, and although the first wife has a role that might seem a little unappreciated, working while the bears at her side the bursts of laughter of her husband and of his little mistresses, and sometimes even witnesses more tender frolicking, she does not show either bitterness or jealousy. In fact, this distribution of roles is not either unchangeable or rigorous, and, upon occasion, although rarely, the

857 b6, who insists that the treatment that one gives the small ani-
609 mal to divest it of its hair be applied to the ethnologist:

21. nãingnãghẽẽ nãnãtẽguẽdne (b1)

Put his beard in the fire! Roast his beard!

857 In general, they are to be good companions, enthusiastic, and
157 untiringly avid for games that are shown them. In exchange, they are very obliging informants once they have become friends. Al-
[55] most all the information which we were able to gather concerning proper names comes from them.[1]

231 This chapter cannot be ended without presenting some observations relating to domestic animals. Not only do the children actually live in very intimate relationships with the animals, but the latter are treated in the family like real children at least outwardly. We mean that they share the group's food, benefit from the same manifestations of tenderness or interest—delousing, games, conversation, caresses—as the human beings. In everything, their treatment is [73] curiously the same. The Nambikwara have numerous domestic animals, first of all dogs, and cocks and hens, who are all descendants of those introduced in their region by the Rondon Commission; monkeys, parakeets, birds of various kinds, and finally, the caetetu, the coati (Nasua sp.), the jaguatirica. Only the dog seems to have acquired an
[229] occasionally utilitarian role in the service of women, for hunting with the digging stick (cf. quotation No. 16). The men never use them for hunting with bow and arrow. The other ani-
231 mals are raised for the purpose of pleasure. They are not eaten,
● 262 the people do not consume the eggs of the hens who lay them in the bush. But they do not hesitate to devour a young bird if it dies after a vain attempt at acclimatization.

The terms used for behavior regarding animals are the same as those used for humans. They say dehêna ulʼtu ulʼkwage, "the woman caresses the baby," or ulʼoutʼtu ulʼkwage, "the woman caresses the puppy."

231 While traveling, except for the animals capable of walking,
482 the whole menagerie is packed with the other baggage. The monkeys, attached to the woman's hair, adorn them with an amusing living helmet, elongated by the long tail curled around the neck of the bearer. The parakeets and hens perch on top of the baskets, other animals are held in the arms. None of them
231 receive abundant nourishment but, even in days of need, they
521 have their share, however little it may be. As compensation, they are an endless subject of distraction for the group, the

[1] [from the children.--Ed.]

and even for carrying could pass. The provisions of manioc proved to be insufficient and one morning the little band found itself without anything to eat. Our own attempts to kill some animal were in vain, and the worst [88] bad humor began to reign, the chief of the group being obviously held responsible for an affair which we, he and I, had contrived. In place of undertaking a hunting or collecting expedition, each one decided to go to sleep in the shade of shelters, and they left the chief alone to find the solution to the problem. He disappeared, accompanied by one of his wives (his first wife a2, contrary to usual procedure; but a3 and a4 shared the general irritation) and toward evening both were seen reappearing, their heavy baskets filled with grasshoppers which they had spent the entire day catching. Although grasshopper pie is not a particularly esteemed dish, everyone ate with good appetite and found his good humor again. They took up the journey again the next morning.

But other things than these exceptional relief measures are expected of the chief. He must sing and dance willingly and well, and be capable of animating the collective life. He must organize the work in the most reasonable way in order to eliminate useless fatigue and effort. Thus on the eve of a departure, B1 recites for us his order of march:

30. mãdkrige mãdohãdhoine hajtehãdige nãnjehaile gietnoonãhara jeoohara kanahaol'hdeere hinkynaha iinãmnje ãheena iinãmnje ihihero ihihero. (b1)
When it is hot, one is tired, one is hungry, the children walk badly; when one marches at dawn, one marches well, at dawn, one should march, change routes, march; on the way! on the way!

He must also win over his companions by numerous gifts. According to B1, who gives in willingly to the servitude of power, generosity plays a fundamental role in determining the degree of popularity which the new chief will enjoy, and the companions indulge in all sorts of speculations:

31. ulihã ahãni ãjoine nunã'ãnunyulihã agnãhare nunãjani (b-1)
The chief is leaving; the one who will come will give me a great deal. --"Chief! Be generous! Give to me!"

The presents thus anticipated consist of food or objects which the chief will have made himself with the assistance of his polygamous wives, or that he will have procured by good exchanges with neighboring bands, or which might come from war booty. Often, it seems,

THEORY OF DEATH

761
775 [100] Death distinguishes between men on one hand, women and children on the other. When they die, the former are transformed into jaguars who represent, consequently, so many reincarnated humans. The women and children, on the other hand, disappear with the wind and the storm and are not susceptible to any reappearance.

40. dend' dütige petnantüna ednadüge lukuñ'ndige ndakuñ'ndige mokañkiadukuñ'ndige dend' dütige monüge lütüge amototiñ'tige toyodütige uitendige (b1)
The woman and child who die do not change into beasts. The man who dies is changed into a jaguar, the woman who dies goes away with the tempest disappears with the storm.

262 Whence, among the Nambikwara, the only perfectly clear prohibition concerning food. Theoretically several exist, broken each time that the occasion is presented, such as those concerning the hawk, the worms from the bacaiuva nuts, and there may be added a probable repugnance concerning the meat of the veado (Cervus sp.). Chickens and dogs are never eaten, but their introduction is recent. On the other hand, the jaguar can be hunted and killed, and its remains are highly regarded since the hide is used to make the fur bonnets worn in the attire of war; but it is not eaten under any pretext:

41. [following preceding text] loukuñ'ndige inkara uñtige lotañtige ikuitüdige nüñtige (b1)
775 [the dead man] becomes a jaguar, another eats him, the jaguar carries him off, he is left to another in order to eat him.

This theory complements the information collected in the eastern group more than it differs from it. The jaguar in fact plays the same role as the atatu, it also carries off the dying. But the central theory adds a complement. This is that the deceased is identified with the animal, who thus becomes a supernatural being. It was not possible to find out if the atatu which one meets at night are considered to be the souls of reincarnated dead people. (1)

776
171 1. One recognizes in the man-eating jaguar gifted with a supernatural nature a typically Tupi theme, although its present diffusion is much greater. See concerning this subject, Métraux, loc. cit., passim.

and Nimuendaju, "Die Sagen von der Erschaffung und Vernichtung der Welt als Grundlagen der Religion der Apapocuva Guarani," Zeitschrift für Ethnologie, Berlin, XLVI, 1914. Also, the atsiu in question in the preceding paragraph, curiously evoke the yurupari, or ananga, ancient Tupi genies of the bush against which they defend themselves with a flaming torch which thus plays the same role as the magic javelin (cf. Thevet, cited by Métraux, loc. cit., p. 61). Finally, the atsiu itself often appears in the form of the jaguar; and in the eastern groups at least, it plays the role of the Messenger of Death which the central, southern, and northern groups give over to the jaguar. There is thus in the vocabulary, a close connection between the stars, the jaguar and the atsiu, already noted by Claude d'Abbeville (cited by Métraux, l. c., p. 49) among the Tupinamba: these identified the jaguar with the stars. Like the "celestial" jaguar (Montoya), the "man-eating" (Nimuendaju), the jaguar of the Nambikwara presents a remarkable ambivalence: it is sacred, and at the same time, they kill it. Finally, comparative linguistics confirms the connection. The term which means jaguar in dialect a1, inaĩru is associated with the name of the jaguar among the central and southern Tupi: yaouare (Emerillon, Coudreau); saoruba (Guajajara, Nimuendaju); jaoaroba (Tapirapé, Kissenberth).

[101] COMMUNICATION WITH A SUPERNATURAL WORLD: SHAMANISM

It is considered possible to receive visions of far-distant things and revelations of future happenings. These supernatural communications are usually produced upon the occasion of tempests and storms. They are sudden and unforeseen. Every adult male is apt to receive them, for in this case too, the women (except, it seems, the elders) are excluded from the spiritual life:

42. iaĩdãdni dẽhũ tamãmatsĩani nahoe ejãhi ekaĩeni kanahãdãu natĩi ajãgaagatĩhemete (b1)
Invisible to women the men see it [the thunder]: "Far away I see, close by I see, tomorrow it will arrive, very near it will arrive."
(It is a question here of a warning vision of messengers come from another tribe).

American Indians. As example of the first aspect we shall mention: the public and "scientific" preparation of the curare; the development of certain therapeutics such as the treatment of ophthalmia by instillation; the flexibility of the sexual division of labor; sexual life in general; the atmosphere of the rites of abstinence; the rational attitude as regards alimentary taboos. Several remarks on this point will make clear the indigenous psychology. The white worms (anadu, a1) which are frequently found in the nuts of the bacaiuva palm have been indicated as being inedible. Subsequently we verified that they were eaten in secret by the children. Thus a8 finds them while cracking nuts and gives them to her little sister a9; and furtively she too eats a worm. Her action is noticed by a3 and a4 who cover her with sarcasm. However one day when food is scarce, A1 eats a plate of worms which his young wife a4 has gathered for him, and sadly remarks that, due to lack of meat, he is reduced to this poor fare. The same observation is made about the hawk. Above we showed what constitutes the metaphysical basis of the alimentary taboo concerning the jaguar. However, the current interpretation is entirely different:

66. ajatedekiga? gilige (b1).
I don't eat any of it, it smells bad!

In the face of new situations, the Indians generally react without mysticism. Thus, A1 before the problem of writing: (1) on the other hand,

1. P. 40 f. and p. 89.

the Nambikwara show total indifference toward photography, even when they have understood its purpose. We have never found [126] Indians who tolerated the participation of the camera in the slightest details of their intimate life with such complete indifference.

However, the passage to irrational positions is made with the same brusqueness which characterizes the two attitudes, almost simultaneous, of so infant hilarity before the still unusual sight of an inflated balloon which burns, and of an appeal to evil magic when a second balloon succeeded in rising. (1) Never does the tender indulgence with which the men surround

1. P. 97.

their companions (2) allow one to suspect the actual metaphysical curse

2. P. 58 f.

with which the women are burdened in the Nambikwara culture, excluded under pain of death from collective ceremonies, deaf and blind to the voice

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

622 and to meet groups too shy to venture forth on the outer fringe. The native band and my own group set out together on a journey supposed to be short; but, because of the animals I had taken, the chief had decided that the usual route through a dense forest could not be used. He led us through the open country, lost his way several times, and we did not reach our destination on the scheduled day. Supplies were exhausted and no game was in sight. The not unfamiliar prospect of a foodless day fell gloomily upon the natives. But, this time, it was the chief's responsibility. The whole project was his own, as well as the attempt to find an easier route. So, instead of trying to discover food, the hungry natives simply lay down in the shadow of the brush and waited for their leader to take them out of this most unpleasant situation. He did not wait or discuss; but, taking the incident as a matter of course, he simply left the camp accompanied by one of his wives. At the camp, the day was spent sleeping, gossiping and complaining. There was no lunch or dinner. But, late at dusk, the chief and his wife reappeared, both heavily laden with baskets filled to the [262] brim. They had hunted grasshoppers the entire day, and, although the expression "to eat grasshoppers" has approximately the same meaning in Nambikuara as the French *manger de la vache enragée*,[1] this food was enthusiastically received, shared and consumed, amidst restored good humor. The following morning, everybody armed himself or herself with a leafless twig and went grasshopper-hunting.

622 595 I have several times referred to the chief's wives. Polygamy, which is practically the chief's privilege, brings him a moral and sentimental reward for his heavy duties together with the practical means of fulfilling them. In the Nambikuara band, apart from rare exceptions, only the chief and the sorcerer (when these functions are divided between two individuals) may have several wives. The chief's polygamy, however, presents special features. It does not constitute a plural marriage but rather a monogamous marriage to which relations of a different nature are added. I have already mentioned the fact that cross-cousin marriage is the usual pattern among the Nambikuara. Another type of marriage also exists, between a man and a woman belonging to the generation following his own, either a wife's "daughter" (true or classificatory) or a sister's niece. Both forms are not uncommon in South America and, together or separately, they have been re-

[1] Closest English equivalent: "to have a rough time of it, to go through the mill."

226 headwater streams. The deep clear streams make fishing with timbó difficult. Game in the forests and on the plain is scarce. Yet by exploiting all the resources of the area the Nambicuara are able to survive. In contrast to the other tribes 262 reported in this monograph the Nambicuara have the broadest resource base, as the list of their resources in Appendix 1 indicates.

132 The Eastern Nambicuara occupy the high plateau between Utiarity and Vilhena. At Utiarity the altitude is 442 meters and at Vilhena [131 143] 685 meters. The dry season extends from May to September. Except for occasional south winds, which bring a cold drizzling rain for a day or two, the season is clear, cool, and dry, the daily temperatures ranging from 80° to 85° F. During this [32 221] period the grass withers, the livestock of the white men having to subsist on shrubs and what fodder the owners can provide. Horses and mules, particularly, suffer during these months. In August [228] the Indians burn the dry grass so that with the first showers new grass can grow out and attract the deer, which the Indians can then hunt.

[305] The dry season, which the Nambicuara call *kwéndire*, is the most difficult. By the end of June they have consumed the manioc, maize, beans, and other crops which they have planted. During July and August they subsist on palm nuts, cumbarú beans, fruta de lobo, snakes, insects, fish, and whatever animals they can kill on the plateau or in the forest. The rainy season 305 (*wahóro*) is divided into periods depending upon 221 the fruits as they come into season. September is known as *pahíhoro*, for during this period the people depend upon the jaboticaba fruit. October and November are called *ya'ennáhiro*, for during these months the bocaiba palm nut ripens. December and January are termed *ólere*, or piqui time. February and March are known as *enóro*, which appears to cover a variety of berries and small fruits. April and May are termed *dzoqueháro*, as many fruits and nuts come into season, particularly, the cashew nut. During these months the garden crops also come in, giving the Nambicuara a short period of abundance.

SETTLEMENTS AND SHELTERS

361 Each of the four Eastern Nambicuara bands
621 has a defined area within which it hunts, fishes, collects, and grows its crops. These territories in-

½ - A fish poison - A] [p. 87 (A)] ½ [See cat. #6, pp. 124-126. - Analyst]

The Wakitisu do not
323 make pottery, but they sometimes acquire pots from the Parecsi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakitisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[142 and carrying a burden basket on her back and a
458 baby strapped on her hip, an older child following
her. As they move slowly along they collect
222 fruits, nuts, insects, snakes, ants, lizards, rats, wild honey, and a great variety of grubs or larvae.
226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262 These were later thrown on hot coals and eaten
223 without being cleaned. Small birds no larger
222 than a sparrow are shot if the man can get near
[344] enough to use his bow and arrow. If they come to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

252 placed on a platform under which a fire is lighted. In this manner large quantities of *kinakápare* can be prepared in one day.

When a woman gets ready to bake a manioc cake she pushes the hot coals and burning wood to one side and pats down the hot bed of the fire with a flat piece of wood. She then breaks off pieces from a dried manioc loaf and crumbles them over the bed of the fire by rubbing them in her hands. When she has crumbled up enough dry manioc, she pats down the flour to form a round, flat cake about 10 inches in diameter and from 1 to 2 inches in thickness. She covers the cake first with hot ashes and then hot coals. After one-half hour she uncovers her oven to find a brown cake covered with ashes and cinders. This sour, dirty, gritty product in no way compares with the fine-textured, sweet manyé of the Camayurá, the meal for which is prepared by crushing the dry ball in a mortar, then sifted to remove the rough fibers, after which the flour is dampened and baked on a pottery baking plate. Sometimes the whole manioc loaf is placed in the fire, and as it bakes the Nambicuara begin to break off pieces from the outside. For ceremonial purposes they bake cakes about 2 feet in diameter.

241 Toward the end of the rains in April and May the Nambicuara return to their fields to enjoy the fresh garden products. The harvest is inaugurated with a harvest ceremony (*koikáeal-tásiro*). [262] [252] Fresh maize, peanuts, and sweetpotatoes are roasted, manioc cakes are prepared, and, if possible, manioc juice is boiled to make chicha. These garden products, along with meat, supply the food for the feast, which lasts for several days. [534] The sacred flutes (*watárika*) are played in the flute hut, the spirits of the ancestors are present, and food and drink are offered to them.

221 The subsistence activities of the Nambicuara are, thus, closely associated with the annual cycle of growth in which agriculture forms but a part. The dependence of the Nambicuara upon the wild products of the forest and plateau are much more complex than has been indicated. They supplied long lists of names of plants, insects, and animals for which no Portuguese names could be found. A full understanding of their economic dependence upon the environment would come only by someone following a band of Nambicuara throughout the year to observe the complete annual cycle of

[p. 92(N)]

221 subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A favorite dish is to crush in a mortar maguioc cakes [262] with boiled beans, broiled meat, ants, palm nuts, [252] monkey and bird bones.

824 As an example of the variety of uses to which the Nambicuara can put a plant we can take the [262] buriti palm: (1) They eat the pulp surrounding [283] the scaly covered nut. (2) They use the fibers from the new growth to make twine. (3) They use the tough, flexible center of the frond stalk for making baskets. (4) They fell the buriti so [262] that a certain variety of grub can collect and multiply in the starchy pith in the heart of the tree. The grubs or larvae they then eat uncooked. [501] (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buriti palm has male associations, for only [766] men can prepare its products. When a male child dies a piece of buriti fiber is left over his grave.

372 The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 18 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick loosens into small smouldering balls. These he places into a handful of dry buriti fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

412 The material equipment of the Eastern Nam-
415 bicuara is extremely simple. Many items, such as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small grater and the few gourd vessels, small baskets, and twine, the woman carries

T: Roquette-Pinto--5 E-4, 5 (no date) 1938 SP17 Nambicuara SP17 (ca. 1912)

165 It seemed to me that these people get their full set of teeth much earlier.

Those molars which are popularly called wisdom teeth, and which are tending to disappear in the white race, are no mere ornaments among the Indians. They are endowed with significant size and function.

264 145 I believe that the excessive amount of work required of their digestive system is reflected in these dental characteristics. The large molars appear earlier because they are needed for frequent and powerful mastication.

● 262 They always eat of everything, without discrimination or restraint. To my knowledge, there is no animal they will not eat. They discard only the intestinal tract of the game they kill.

[192] The Indians of the Juruena River consume more meat than the others; those from José Bonifácio eat more manioc and maize. Their [514] intestinal gas makes their company unpleasant. They all have furred 164 tongues, and many have gums affected by alveolar pierrhea. Their teeth, contrary to frequent cases among the Sambaqui skulls, do not suffer from the state of wear which Lund described in 1842 for Lagoa Santa man; but they suffer from caries which do not spare the crowns.

A special skin disease prevails among the Indians of the Serra do Norte. (1)

[513]

1. See E. Roquette-Pinto, Lectures at the Biblioteca Nacional [National Library] on March 15, 1913, and at the Sociedade Brasileira de Dermatologia, Policlinica Geral do Rio de Janeiro [Brazilian Dermatological Society, Main Polyclinic of Rio de Janeiro], on June 11, 1912.

[181] Actually, some officials of the Rondon Commission had noticed the characteristic scabs of the disease. Owing perhaps to a lack of typical cases such as I witnessed, however, they took the spots [513] to be mere skin exfoliations caused by the friction of the body on the ground, where the Serra do Norte Indians sleep.

The external layers cover the whole building, like very precise and well clipped sheets of straw. The side walls are not distinct from the roof, but mere extensions of it.

Of the two houses we have described, in the village close to the Caruni (or Festa da Bandeira) River, the larger covers 30 meters in circumference, the other 28. Their doorways measure 0.37 meters in width by 0.52 meters in height. These two houses stand on a plaza some twenty meters in diameter.

Inside the huts stand three bamboo grids [giraus] to dry manioc scrapings, and two enormous black pots which could not have come through the door; lighter utensils and various other implements, as well as ornaments, are kept in the ceiling thatch. This serves as the Indians' closet, where they hide their smaller belongings. [Fig. 24]

A small fire burns underneath each grid.

These grids were made up of four bamboo stalks sunk into the ground and supporting a horizontal grate of small bamboo reeds. They measured about two meters in length by one and a half in width.

The huts are not equipped with any smoke holes, and none are needed. The smoke of inside fires filters easily through the interstices of the thatch.

Around the dwelling, scattered or in heaps, lie disjointed bones, fragmented cocoanuts, pods of the jacobá bean, corn cobs, charcoal, and food refuse, mixed with worn-out tools and utensils.

In the village on the Festa da Bandeira River, I found beside a house a large object which I only failed to bring back because it would have been absolutely impossible to transport it. It was of a kind commonly found in the sambaquis [2124] of the Atlantic coast: a rock pitted with several depressions large enough to hold a fingertip. To one side lay a prodigious quantity of small bacaba nuts, both shelled and unshelled. It has often been inferred that this implement was used to produce fires, but in the Serra do Norte it merely serves to shell palm nuts. This stone, however, was much larger than those generally encountered in the sambaquis.

The temporary shelter consists of a screen of leaves and branches. The Indians may use it for a few days if hunting in the area is good; then they abandon it.

[Fig. 18]

[241] They subsist chiefly on the produce of husbandry; the development of agriculture in their backward milieu [229] constitutes one of the paradoxical traits of this tribe.

[242] As a general rule, it may be said that the Nambicuara eat of everything; unlike some other Indians, they do not shun certain species of animals. A mosquito that lands on their body, a louse, a locust, a small lizard that scampers by--nothing is spared.

[250] Some of them carry sticks to kill any snakes they may encounter; they roast them in the embers and eat the delicacy with pleasure.

After roasting their catch, they discard only the stomach.

At the camp on the Primavera River, whenever one of them was hungry he would run off into the bush and return with a live calango [a small lizard]; after beating the head of the little animal against a piece of wood [230] he would throw it into the hot ashes. Later he would tear open the animal's abdomen with his nails, remove the stomach and enjoy the rest. On another occasion, the Indians caught an armadillo and killed it by twisting its neck.

In hunting and fishing they use arrows that will be described later.

252 They prepare the eggs of the wild duck (Cairina moschata,
242 L.) by nestling them in shallow depressions in the embers after
[243] turning them on a diminutive spit stuck through a small hole punched in the shell.

The meat of large game--deer, paca (Coelogenis paca), [225] capybara (Hydrochoerus capybara)--is utilized only after it has been pounded in a mortar or beaten between two pieces of wood.

[Fig. 19]

264 They cut off large pieces with their nails, with their teeth, and sometimes with knives of wood or bamboo. No sooner have they gulped down what is in their mouth than they suck their fingers, cluc[illegible] their tongue noisily.

251 The Tagnani are familiar with the preserving properties of smoke; the meat we handed out to them was not all eaten on the same day. They hung the remnants on the barbecue [moquém].

252 The Cocozu do not use a barbecue; they roast their meat in the embers. The quantity of ashes they swallow with the roast is considerable.

[Plates p. 230.]

[231] The Tagnani and Tawite build a characteristic type of barbecue. They set up four stakes which they connect with four crosspieces; between these they place two sticks to hold the pieces of meat.

[Fig. 23]

[272] They drink honey mixed with water (hydromel). They like 262 young bees, which they eat with the honey and wax.

They do not allow the maize to ripen, but eat it roasted when still green. Manioc is subjected to the same process, or it is used in 252 grated form to make cakes [beiju].

They press the gratings with embira cord and prepare very white pellets with the starch. To make the cakes, they open a cavity in the hot ashes of the fire and deposit in it a pellet of manioc dough which they smooth out with some piece of wood and with their hands. Then they cover it with ashes and embers; after a period of time which we do not know how they estimate, they uncover a large, roasted, sweet-smelling cake, somewhat sour, but which would be rather pleasant if it were not so covered with ashes and if it had not been prepared by such an unclean process...

[262 271] Green mangaba, (1) no sooner seen, is immediately plucked

1. Fruit of the mangabeira (Hancornia speciosa). (Ed.)

and placed in the embers. When roasted, it turns tender and pleasing to the taste.

From bacaba palm nuts the Tawite make a purplish mush [262] (uidniaré) which tastes like green leaves and which they relish. In order to prepare this uid-niaré, they pound the fruit of the palm and place it in water over the fire. This is actually a decoction.

273 We did not have an opportunity to observe the preparation of any fermented liquids. Yet the Indians make alcoholic beverages by

273 the usual process: they masticate manioc or maize and allow the mush to ferment in large pots. One drink thus extracted from the wild pineapple was held in high regard by the personnel of the Telegraph Line.

[262] 226 They are especially fond of monkey meat--a last vestige, perhaps, of their former cannibalistic tastes.

I do not think that cannibalism still exists among them. But I believe that it has not been long since the habit was lost.

It is true, nevertheless, that they often accuse one another of this practice; they make such accusations in a perfectly clear manner, by means of unequivocal signs.

272 [233] They make fire by rubbing together two rods similar to those found elsewhere in Brazil.

This procedure takes much longer than might be expected.

The Indian begins by placing a dry leaf upon the ground; upon it he rests the "stationary fire stick," which he supports with his foot and knee.

[Fig. 26]

Holding the "movable fire stick" between the palms of his hands, he imparts to it the necessary rotary motion, bearing down with it at the same time against the other stick. This motion forces the hands downward along the rod; [when he gets to the bottom], the Indian starts again from the top. Now and then he stops briefly to lick his palm, which smarts from the friction. After a while, when sweat is already beading his forehead, a spark strikes up among the tinder which has been deposited on the leaf.

This process differs from the classical technique only by the presence of the protective leaf.

Because this procedure is laborious, the Indians carry it out with reluctance. Desirous of obtaining a film which would document all their routine activities, I had great difficulty in persuading an Indian to make fire. This is the reason why, of all gifts, matches are among those valued most highly; to make fire after their fashion on a rainy day or in humid weather is a hard and laborious task.

[262 274 194] The Tagnani and Tawite also eat a certain kind of mushroom (Polyporus sp.) which the others disregard.

[274] It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

273 Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful [271] to those with open wounds or sores; the same pineapples, when green [272] are good for curing sores, for their juice eats away all the rotten and putrid flesh, and the aborigines know this; in such wise does this fruit [269] eat away, that they use its rind to wipe off the rust from their swords and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

263 The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

262 Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Anuncçú!"

261 One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

262 The children are given to eat of everything; no matter what 265 goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

276 Even the stimulants they use--tobacco, for instance--are shared 255 with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

[13]

1. Cf. E. Roquette-Pinto, "A condição da criança entre os Indios do Brazil [The Status of the Child Among the Indians of Brazil," Primeiro Congresso Americano da Criança [First American Congress on Childhood] (Tucumán, 1916).

264 The children partake of a meal immediately; the women eat later... whatever is left over, if there is a leftover. This, by the way, is the rule even among civilized Indians... But in general, if there is plenty, each helps himself to whatever there is, when he wishes and as he wishes; the food belongs to all.

262 [236] They skillfully remove the gall bladder from the liver of the animals they devour, but they do not have a special name for it.

[252] Aarú is a cake which the Cocozu prepare by pounding up a whole roasted armadillo in a mortar until its bones are completely mashed, and then mixing it with manioc dough in the form of beiju.

[325] An upland rat (Scapteromys gnambiquarae, Miranda Ribeiro), which the Paresi call cólori, is prized by the Nambicuara as a delicacy. They call it arantaçú.

244 They gather and utilize the produce of their husbandry from day to day. They have no special harvesting time, and no stores or surpluses except for the tobacco which they keep between two sticks hanging from the ceiling thatch.

251 There is always manioc dough in the house; it is the Nambicuara bread, which they eat with all their other foods. They keep the dough in large baskets lined with pacova (1) leaves.

1. A kind of banana. (Ed.)

[237] Leftover honey is kept in the gourd; it does not reach fermentation because the desire [to drink it] soon revives in some Indian...

261 [115] We did not see any rite connected with food; but the soldier Gouveia, who was held prisoner in a Nambicuara village for six months in 1911, witnessed such a ceremony. The Indians of that village (which was named Urutau) had killed a large tapir. (1) This was

[328]

1. Tapirus americanus, fairly abundant along the rivers of the area. Hard to catch because very wary.

[the pretext for] a feast. They dragged the animal to the village plaze. Then the men went off into the bush to gather branches with

226 Tephrosia toxicaria is a poisonous legume, a kind of tingui
[Lupinus coccavella] used in fishing.

278 They are not familiar with the fishhook, and use [276: full page of figures] [277] a sort of fish trap made with bamboo or with the stem of the tinara liana (Desmoncus sp.).

252 The following foodstuffs are represented in the collection.

--Guaiatú: white maize.

--Urinodzu: manioc dough, which under microscopic examination proved to be very rich in starch grain. The root, once grated, is pressed [by wringing] with a straw cord, the çaaru. (1) The grater

[426]

1. [Heloisa Alberto Torres notes that the cylindrical tube used to press manioc by some Amazonian tribes must have spread from the Guianas to the valley of the Amazon. Métraux considers the woven band used for the same purpose and found on the periphery of the tube territory a more primitive form. The simple straw cord of the Nambicuara would thus constitute an even more primitive variant.]

is of the type used by the Xingu Indians (Suya, etc.). It consists of a board with about two [twenty?] rows of small sticks.

[Fig. 17]

252 --The larvae of a butterfly, which they eat alive.

--Katunuzú: anthill clay, which they also eat.

. . . . . .

[629] --A mushroom, orelha de pau (Polyporus sp.), which is eaten, and beans (Phaseolus sp.) of unusual aspect were also found in one village. [278] The smoked [moqueada] head of a great anteater was [251] found in a basket by Miranda Ribeiro during the 1909 expedition.

415 Mortars (nutêzê) are hollowed out by means of fire and used to
252 pound meat and other foods.

/218 cont./

224 The poisoned arrows are intended for hunting certain ani-
278 mals, some large birds, cervids, and especially monkeys.
911
[243] Birds wounded by one of these arrows fall almost immediate-
ly.

A monkey mortally wounded with an ordinary arrow or even a bullet often remains hanging from the branches. Under the action of curare it holds itself immobile at first, then begins to tremble and falls several minutes later (five to 10 at the most) as soon as paralysis is produced.

A peccary or small deer such as the Cervus campestris wounded in the body runs for one or two minutes, then stops exhausted, is attacked by tremors and lies down.

The tapir, very large, resists a long time; it can run for two hours before stopping; hence the Indians do not hunt it with curare.

[243] /217/ The meat of animals killed with curare may be
255 eaten without harm; the Ñambikwara of the Juruena content themselves with cutting away the flesh around the wound impregnated with poison and colored yellow; the Çabanè do not even take this precaution.

279 Poisoned arrows are also used for war; this is perhaps their
911 principal object among many Ñambikwara groups, who possess
726 only a very few specimens during normal times.

None of the Indians know of an efficacious antidote. According to our informants wounds in the trunk would always be fatal to men. By immediately drawing out the arrow, it might be possible to survive a wound in a limb; in order to make their extraction more difficult, the points of the poisoned arrows, especially those of the Çabanè, are very lightly attached to their shafts.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

When rains come, the *Nambicuara* settle in temporary villages, and the men open circular gardens in the gallery forest by burning and felling the trees with stone (now steel) axes. They till the soil with pointed sticks and raise both bitter and sweet manioc, several kinds of maize which are different from those of their more civilized neighbors (Roquette-Pinto, 1938, p. 297 n.), beans, gourds, cotton, urucú, and a variety of small tobacco with tiny leaves. Despite the difficulty of fishing in the deep, clear tributaries of the Juruena River, they have moderate success using fish arrows, basket traps, and a drug made of a vine.

Food preparation.—Game is usually only half cooked in hot ashes, but it is sometimes smoked on rectangular or pyramidal babracots. Manioc is grated on thorns of the catinal palm (*Iriartea* sp.) imbedded in palm wood planks. To remove the poisonous juice of bitter manioc, the pulp is either squeezed in a strip of bark twisted spirally or buried for several days to allow the juice to drain off. Balls of the pulp are then sun-dried and packed in leaves in baskets or buried at marked places. In times of scarcity, perhaps months later, the half-rotten balls are made into flat cakes, hastily cooked in hot ashes, and eaten.

The *Nambicuara* cannot bear to eat salt, which they do not know how to prepare, or pepper, which they do not cultivate. Even hot food is cooled with water before it is eaten. Wild honey, too, is diluted with water. The only condiment is a variety of cumaru bean which has a strong, bitter almond taste. It is boiled in pots; afterward the liquid is drunk and the beans are mixed with food, especially with grasshoppers crushed in mortars. Armadillo meat is often ground with maize flour.

Domestic animals and pets.—The *Nambicuara* have many pets, especially monkeys, coatis, parrots, and birds. Domesticated animals were unknown until the Rondón Commission introduced chickens and dogs. Although at first extremely afraid of dogs, the Indians quickly adopted them and treated them with the same deep affection they show all their tame animals. Even now they are terrified by oxen seen at telegraph stations, and call them by the name given to the deadly spirits of the water and the bush. They do, however, hunt and eat horses and mules as if they were wild game.

HOUSES

The surprising variety of house types suggests recent borrowing from neighboring tribes. The *Nambicuara*, like the *Siriono*, may formerly have lacked houses entirely. During most of the year, even at the present time, they build only scanty temporary shelters for a single night. These consist of branches of palms stuck into holes dug in the sand to form a half or quarter circle on the side from which the sun, the wind, or rain are expected (pl. 37, *center, left*). Each individual family builds its own

[276] It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

[273] Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful [277] to those with open wounds or sores; the same pineapples, when green [251] are good for curing sores, for their juice eats away all the rotten and [274] putrid flesh, and the aborigines know this; in such wise does this fruit eat away, that they use its rind to wipe off the rust from their swords and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

● 263 The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

262 Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Anungá!"

261 One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

262 The children are given to eat of everything; no matter what 855 goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

274 Even the stimulants they use--tobacco, for instance--are shared 855 with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

[13]

1. Cf. E. Roquette-Pinto, "A condição da criança entre os Indios do Brasil [The Status of the Child Among the Indians of Brazil," Primeiro Congresso Americano da Criança [First American Congress on Childhood] (Tucumán, 1916).

224 with them and informs the flanking hunters with bird calls. When completely surrounded the flanking parties drive the pigs back against the central group where the best archers are stationed. As the pigs charge back, they are shot at close range. Usually an arrow will stop a peccary so that it can be killed later with a club. If the hunters are well organized very few peccaries escape.

252 The hunters then open up all the pigs and take out the viscera. The entrails are emptied and [264] along with the heart, liver, etc., are thrown on hot coals to broil and are eaten on the spot.

[442] When opening an animal the hunter grasps a handful of skin over the belly and cuts it off with a bamboo knife leaving a round hole through which the viscera are drawn out. After everyone has eaten, the carcasses are carried back to camp where the meat is cut up and shared among the families, the man with a large family getting more than one with a small family even though the [251] man had not shot anything. All meat that cannot be eaten in a day or two is cut up and dried.

224 The Nambicuara now have a few dogs which [231] they use when hunting jaguars. The dogs drive the jaguar into a tree where it can be shot with a gun or with arrows. Sometimes a wounded jaguar will attack the hunters, and injuries occur. Marciano's 6-year old son had his head and face clawed by a wounded jaguar which his father was not able to kill with the first shot of his shotgun.

Armadillos are dug out of holes. The soil is first loosened with a stick and then dug with a gourd, the diggers sometimes having to go as deep as 8 feet. When they get near the armadillo they put a long stick under it and force it up against the top of the hole in order to prevent it from digging further. When near enough a man reaches into the hole with his hand and pulls out the armadillo. If the hunters are very hungry [264] they will roast the armadillo on the spot, taking left-over pieces of roasted meat home to their families.

224 Although sharing is the custom, and it is amus-
264 ing to observe several men sitting around a 6-inch lizard to eat it, single hunters sometimes succeed in avoiding their obligations. One day as I walked along with Cascudo, followed by several Nambicuara some distance behind, he killed a snake and threw it into the bushes and signaled

224 to me not to say anything. Later that day he
264 returned to the spot, built a fire, roasted the snake, and ate it by himself.

224 Caymans are hunted by first finding their hide-outs under logs or overhanging banks. When one is found under an overhanging bank the hunters peel a number of slender poles and begin to thrust them down through the bank to force the cayman out. Men are stationed above and below the spot, and as the cayman comes out he is shot. When he hides under logs the hunters feel for him with their feet. The hunters are so nimble that few of them get bitten. The large rodent, paca, is also hunted in this way, for it hides in holes under overhanging banks.

The large water snake, anaconda, is hunted in pools where it lies in wait for game. When the hunters have trailed an anaconda to a water hole they keep shooting arrows into the water until they strike it. The first strike then indicates where the snake is, and they continue shooting until the snake weakens and can be pulled out. Sometimes the snake grabs a hunter by the arm, but the others are there to assist if anyone gets into difficulties.

Small anteaters are dug out of holes but the larger kind which does not go into holes is hunted by two men armed with clubs. The men chase it, one on each side, and as the anteater turns on one he strikes it on the nose with his club and then jumps into a tree. The other hunter then strikes it. This continues until the anteater dies.

Monkeys are chased from tree to tree until they tire and come down to hide in a hole in the ground. Dogs can then overtake the monkey or he can be shot or dug out of the hole. Deer usually do not fall when shot, but the hunter chases the wounded deer until he can shoot more arrows into it, especially into the legs.

[278 184] Although the Western Nambicuara are said to use arrows poisoned with curare, the Wakitisu say they do not use curare but that they know how to prepare it and that they formerly used it in raids. As arrows do not penetrate bone, the hunter tries to shoot at an angle so that the arrow will enter the chest cavity, or he will aim between the neck and the shoulder bone.

223 The Nambicuara hunt and eat all birds except the urubú. Large rheas are not hunted because it is difficult to approach them on the open sa-

412 in her burden basket, whereas the modern axes,
415 knives, and other tools, along with his ornaments, the man carries in a similar basket, or he straps this basket on the back of a boy while he walks in front of the file carrying his bow and arrows or gun ready to shoot whatever game is met along
●[264] the way. Whenever they kill some animal or catch a few fish and feel hungry they stop and prepare a meal. During the dry season they are at home anywhere in their band territory, moving only when hunger spurs them on.

411 Today, of course, the Nambicuara have steel
412 axes and knives. The heavy equipment of the
177 Wakiltisu band in 1949, consisted of three axes, two shotguns, and some half dozen hoes which were hidden near their permanent house. Each man had a butcher knife, but all men did not have bows and arrows. There did not appear to be any desire on the part of each man to possess these implements. So long as the band had a few of these objects everyone seemed to be satisfied. Cascudo, a widower when he arrived in Utiarity, did not possess a bow and arrow, nor a gun, nor an ax. By working for the Protestant missionaries he acquired an ax and when Marciano
[439] died he inherited his bow and arrows. After a few days, however, he had given the bow and arrows to a Brazilian in exchange for a felt hat.

412 Examining the hand tools which Julio used, the following articles were found: A chisel (*kwatiru*) made by inserting a piece of steel into a wooden handle wound with twine; a small bamboo
[306] knife (*alkúkwirikatu*); a hardwood drill (*Makatu*), used with sand for perforating tucum nut shells in making beads; a piece of sandstone (*dáligisu*), used as a whetstone; a number of rough leaves of the lixeiro tree (*kle'énatu*), used as sandpaper; and a
415 comb (*ka'dlatu*). Each of Julio's three wives had a burden basket, a small square basket, and two or three gourd vessels of various sizes. A single wooden mortar and pestle did service for the whole band.

411 One of the most important implements of the Nambicuara is the bow, *Ádkisu*, made from the piuva (jacaranda-copaia) or the siriva palm (*Syagrus speciosa*). By far the most common is the bow made from piuva, ranging between 6 and 7 feet in length, flat on the inside and convex on the outside. One of the bows examined measured 2 meters and 14 cm. in length, 4 cm. in width, and 1.5 cm. in

Chapter VIII

Physical Anthropology and Pathology

123 [175] Unfortunately in 1912 the Nambicuara were not yet sufficiently accustomed to the presence of strangers in their mountains. In spite of their bribed willingness, they viewed my research with justifiable suspicion.

101 124 The Indians who were examined belonged to the following groups: Cocozu, Anunze, Tagnani and Tawite [Tauitê]. Among the Uaintaçu, a still hostile group, I was able to gather only one incomplete set of data. The state of excitement of the Indian during the examination did not permit better results.

142 Their skin is the color of yellowish burned sienna, dark among the Cocozu, light among the others. Some Tagnani individuals have an almost pinkish complexion. Many nearly black types are found among the Indians of the Juruena and Juina rivers; those are the darkest Indians in Brazil. On the Roquette-Childe color scale used in the National Museum of Rio de Janeiro, the coloring of these Indians varies between numbers six and ten.

The skin is coarse and wrinkled.

The hair is straight and coarse (lissotrichous). Some individuals have wavy hair similar to that of the Polynesians. The Indians 302 usually pull out their body and face hair and cut it on the forehead with a bivalve shell. [176] A few of them leave some strands of hair above or below the lips.

● [264] Nearly all permit their nails to grow freely, for they make useful implements to tear the meat at mealtime.

[147] The soles of their feet never become thickly callused as those of Negroes who go barefoot.

142 Their feet are relatively large, their legs slender and muscular. The abdomen is prominent, the hands small. The chest is knotty [encordoado] and not very large.

141 The measurements which we were able to obtain for normal adult males are shown in Tables A and B.

1 [See pp. 66-67, category 116. —Analyst]

1 [Nambicuara sub-groups -- Analyst]

145 It seemed to me that these people get their full set of teeth much earlier.

Those molars which are popularly called wisdom teeth, and which are tending to disappear in the white race, are no mere ornaments among the Indians. They are endowed with significant size and function.

264 I believe that the excessive amount of work required of their 145 digestive system is reflected in these dental characteristics. The large molars appear earlier because they are needed for frequent and powerful mastication.

262 They always eat of everything, without discrimination or restraint. To my knowledge, there is no animal they will not eat. They discard only the intestinal tract of the game they kill.

[194] The Indians of the Juruena River consume more meat than the [514] others; those from José Bonifácio eat more manioc and maize. Their 164 intestinal gas makes their company unpleasant. They all have furred tongues, and many have gums affected by alveolar piorrhea. Their teeth, contrary to frequent cases among the Sambaqui skulls, do not suffer from the state of wear which Lund described in 1842 for Lagoa Santa man; but they suffer from caries which do not spare the crowns.

A special skin disease prevails among the Indians of the Serra do Norte. (1)

[113]

1. See E. Roquette-Pinto, Lectures at the Biblioteca Nacional [National Library] on March 15, 1913, and at the Sociedade Brasileira de Dermatologia, Policlinica Geral do Rio de Janeiro [Brazilian Dermatological Society, Main Polyclinic of Rio de Janeiro], on June 11, 1912.

[181] Actually, some officials of the Rondon Commission had noticed the characteristic scabs of the disease. Owing perhaps to a lack of typical cases such as I witnessed, however, they took the spots [513] to be mere skin exfoliations caused by the friction of the body on the ground, where the Serra do Norte Indians sleep.

[Fig. 18]

241 They subsist chiefly on the produce of husbandry; the development of agriculture in their backward milieu [229] constitutes one of the paradoxical traits of this tribe.

262 As a general rule, it may be said that the Nambicuara eat of everything; unlike some other Indians, they do not shun certain species of animals. A mosquito that lands on their body, a louse, a locust, a small lizard that scampers by--nothing is spared.

[252] Some of them carry sticks to kill any snakes they may encounter; they roast them in the embers and eat the delicacy with pleasure.

After roasting their catch, they discard only the stomach.

At the camp on the Primavera River, whenever one of them was hungry he would run off into the bush and return with a live calango [a small lizard]; after beating the head of the little animal against a piece of wood [230] he would throw it into the hot ashes. Later he would tear open the animal's abdomen with his nails, remove the stomach and enjoy the rest. On another occasion, the Indians caught an armadillo and killed it by twisting its neck.

In hunting and fishing they use arrows that will be described later.

252 They prepare the eggs of the wild duck (Cairina moschata,
262 L.) by nestling them in shallow depressions in the embers after
[325] turning them on a diminutive spit stuck through a small hole punched in the shell.

The meat of large game--deer, paca (Coelogenis paca),
[325] capybara (Hydrochoerus capybara)--is utilized only after it has been pounded in a mortar or beaten between two pieces of wood.

[Fig. 19]

264 They cut off large pieces with their nails, with their teeth, and sometimes with knives of wood or bamboo. No sooner have they gulped down what is in their mouth than they suck their fingers, clucking their tongue noisily.

251 The Tagnani are familiar with the preserving properties of smoke; the meat we handed out to them was not all eaten on the same day. They hung the remnants on the barbecue [moquém].

264 The children partake of a meal immediately; the women eat later... whatever is left over, if there is a leftover. This, by the way, is the rule even among civilized Indians... But in general, if there is plenty, each helps himself to whatever there is, when he wishes and as he wishes; the food belongs to all.

262 [236] They skillfully remove the gall bladder from the liver of the animals they devour, but they do not have a special name for it.

[252] Aarú is a cake which the Cocozu prepare by pounding up a whole roasted armadillo in a mortar until its bones are completely mashed, and then mixing it with manioc dough in the form of beiju.

[825] An upland rat (Scapteromys gnambiquarae, Miranda Ribeiro), which the Paressi call cólori, is prized by the Nambicuara as a delicacy. They call it arantaçú.

241 They gather and utilize the produce of their husbandry from day to day. They have no special harvesting time, and no stores or surpluses except for the tobacco which they keep between two sticks hanging from the ceiling thatch.

251 There is always manioc dough in the house; it is the Nambicuara bread, which they eat with all their other foods. They keep the dough in large baskets lined with pacova (1) leaves.

1. A kind of banana. (Ed.)

[237] Leftover honey is kept in the gourd; it does not reach fermentation because the desire [to drink it] soon revives in some Indian...

261 We did not see any rite connected with food; but the soldier [115] Gouveia, who was held prisoner in a Nambicuara village for six months in 1911, witnessed such a ceremony. The Indians of that village (which was named Urutau) had killed a large tapir. (1) This was [825]

1. Tapirus americanus, fairly abundant along the rivers of the area. Hard to catch because very wary.

[the pretext for] a feast. They dragged the animal to the village plaze. Then the men went off into the bush to gather branches with

273 the usual process: they masticate manioc or maize and allow the mush to ferment in large pots. One drink thus extracted from the wild pineapple was held in high regard by the personnel of the Telegraph Line.

[262] They are especially fond of monkey meat--a last vestige,
266 perhaps, of their former cannibalistic tastes.

I do not think that cannibalism still exists among them. But I believe that it has not been long since the habit was lost.

It is true, nevertheless, that they often accuse one another of this practice; they make such accusations in a perfectly clear manner, by means of unequivocal signs.

372 [233] They make fire by rubbing together two rods similar to those found elsewhere in Brazil.

This procedure takes much longer than might be expected.

The Indian begins by placing a dry leaf upon the ground; upon it he rests the "stationary fire stick," which he supports with his foot and knee.

[Fig. 26]

Holding the "movable fire stick" between the palms of his hands, he imparts to it the necessary rotary motion, bearing down with it at the same time against the other stick. This motion forces the hands downward along the rod; [when he gets to the bottom], the Indian starts again from the top. Now and then he stops briefly to lick his palm, which smarts from the friction. After a while, when sweat is already beading his forehead, a spark strikes up among the tinder which has been deposited on the leaf.

This process differs from the classical technique only by the presence of the protective leaf.

Because this procedure is laborious, the Indians carry it out with reluctance. Desirous of obtaining a film which would document all their routine activities, I had great difficulty in persuading an Indian to make fire. This is the reason why, of all gifts, matches are among those valued most highly; to make fire after their fashion on a rainy day or in humid weather is a hard and laborious task.

[262 274 184] The Tagnani and Tawite also eat a certain kind of mushroom (Polyphorus sp.) which the others disregard.

SP17 Nambicuara SP17

533 **Music and dance.**—Music is clearly tonal, with melodic structures easy to identify. The end of a melody is usually marked with several shrill sounds which are repeated after each coda. Music is both instrumental and choral and usually accompanies dances.

535 Dances are performed under the leadership of the chief. Men and women stamp rhythmically on the ground while turning in a circle. Usually, dancers close one nostril with the left hand to make their singing nasal. Only men perform war dances, forming one or more rows and stepping forward and backward in front of the leader. In the second phase of the dance, they attack a post, a symbolical enemy, with bows and arrows, and clubs. Most of the dances and songs are connected with hunting or seasonal ceremonies, but they may be used at any time for mere entertainment.

534 **Musical instruments.**—Flageolets have four holes and an air duct; three are usually played together, accompanied by a rhythm trumpet made of a piece of bamboo with a hollow calabash fixed to its bottom. Nose flutes (pl. 36, *top, right*) are made of two pieces of calabash glued together with wax and pierced with three holes. One hole is blown with one nostril while the other nostril is closed with the thumb; the other two holes vary the notes. Nose flutes are also played in unison. Double and treble whistles have the air duct cut in the middle of the pipe, so that they can be blown at either end. Panpipes (pl. 36, *bottom, left*) are of two kinds: the common type has five pipes; the other type consists of two or three reeds cut obliquely at the mouth-end. All pipes produce approximately the same note in the latter.

272 273 **Drinks and narcotics.**—Drinks are made with crushed manioc or maize mixed with water, or of palm fruits, especially *Mauritia* sp., *Acrocomia* sp., and *Oenocarpus distichus*. A slightly alcoholic beverage is prepared of wild pineapples mixed with water.

276 The *Nambicuara* are ardent smokers. They cultivate a tobacco with tiny leaves, which they dry between two pieces of wood, crush with their hands, and store in small calabashes. Cigarettes are rolled in special leaves and tied with grass.

MAGIC AND RELIGION

771 The *Nambicuara* believe in the existence of a diffuse power or substance which may occur in objects and in living beings. It is manifest mostly in poisons, some of which are real (see Weapons, p. 366), some purely magical. To the latter belongs the rosin of the barrigudo tree (a Bombacaceae), which is kept in tubes like the true poisons. When thrown by a special technique at an enemy, it is believed to make him swell like the trunk of the tree and die.

776 There are also dangerous spirits of the bush and of water, which may appear in the shape of an animal, especially the jaguar, or in a

252 The Cocozu do not use a barbecue; they roast their meat in the embers. The quantity of ashes they swallow with the roast is considerable.

[Plates p. 230.]

[231] The Tagnani and Tawite build a characteristic type of barbecue. They set up four stakes which they connect with four crosspieces; between these they place two sticks to hold the pieces of meat.

[Fig. 23]

●[272] They drink honey mixed with water (hydromel). They like 262 young bees, which they eat with the honey and wax.

They do not allow the maize to ripen, but eat it roasted when still green. Manioc is subjected to the same process, or it is used in 252 grated form to make cakes [beiju].

They press the gratings with embira cord and prepare very white pellets with the starch. To make the cakes, they open a cavity in the hot ashes of the fire and deposit in it a pellet of manioc dough which they smooth out with some piece of wood and with their hands. Then they cover it with ashes and embers; after a period of time which we do not know how they estimate, they uncover a large, roasted, sweet-smelling cake, somewhat sour, but which would be rather pleasant if it were not so covered with ashes and if it had not been prepared by such an unclean process...

[262 824] Green mangaba, (1) no sooner seen, is immediately plucked

1. Fruit of the mangabeira (Hancornia speciosa). (Ed.)

and placed in the embers. When roasted, it turns tender and pleasing to the taste.

From bacaba palm nuts the Tawite make a purplish mush [262] (uidniarê) which tastes like green leaves and which they relish. In order to prepare this uid-niarê, they pound the fruit of the palm and place it in water over the fire. This is actually a decoction.

273 We did not have an opportunity to observe the preparation of any fermented liquids. Yet the Indians make alcoholic beverages by

It is true, nevertheless, that they often accuse one another of this practice; they make such accusations in a perfectly clear manner, by means of unequivocal signs.

372 [233] They make fire by rubbing together two rods similar to those found elsewhere in Brazil.

This procedure takes much longer than might be expected.

The Indian begins by placing a dry leaf upon the ground; upon it he rests the "stationary fire stick," which he supports with his foot and knee.

[Fig. 26]

Holding the "movable fire stick" between the palms of his hands, he imparts to it the necessary rotary motion, bearing down with it at the same time against the other stick. This motion forces the hands downward along the rod; [when he gets to the bottom], the Indian starts again from the top. Now and then he stops briefly to lick his palm, which smarts from the friction. After a while, when sweat is already beading his forehead, a spark strikes up among the tinder which has been deposited on the leaf.

This process differs from the classical technique only by the presence of the protective leaf.

Because this procedure is laborious, the Indians carry it out with reluctance. Desirous of obtaining a film which would document all their routine activities, I had great difficulty in persuading an Indian to make fire. This is the reason why, of all gifts, matches are among those valued most highly; to make fire after their fashion on a rainy day or in humid weather is a hard and laborious task.

[262 [Polyporus sp.) The Tagnani and Tawite also eat a certain kind of mushroom which the others disregard.

It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful to those with open wounds or sores; the same pineapples, when green are good for curing sores, for their juice eats away all the rotten and putrid flesh, and the aborigines know this; in such wise does this fruit eat away, that they use its rind to wipe off the rust from their swords and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Anungçú!"

One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

The children are given to eat of everything; no matter what goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

Even the stimulants they use--tobacco, for instance--are shared with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

533 **Music and dance.**—Music is clearly tonal, with melodic structures easy to identify. The end of a melody is usually marked with several shrill sounds which are repeated after each coda. Music is both instrumental and choral and usually accompanies dances.

535 Dances are performed under the leadership of the chief. Men and women stamp rhythmically on the ground while turning in a circle. Usually, dancers close one nostril with the left hand to make their singing nasal. Only men perform war dances, forming one or more rows and stepping forward and backward in front of the leader. In the second phase of the dance, they attack a post, a symbolical enemy, with bows and arrows, and clubs. Most of the dances and songs are connected with hunting or seasonal ceremonies, but they may be used at any time for mere entertainment.

534 **Musical instruments.**—Flageolets have four holes and an air duct; three are usually played together, accompanied by a rhythm trumpet made of a piece of bamboo with a hollow calabash fixed to its bottom. Nose flutes (pl. 36, *top, right*) are made of two pieces of calabash glued together with wax and pierced with three holes. One hole is blown with one nostril while the other nostril is closed with the thumb; the other two holes vary the notes. Nose flutes are also played in unison. Double and treble whistles have the air duct cut in the middle of the pipe, so that they can be blown at either end. Panpipes (pl. 36, *bottom, left*) are of two kinds: the common type has five pipes; the other type consists of two or three reeds cut obliquely at the mouth-end. All pipes produce approximately the same note in the latter.

272 273 **Drinks and narcotics.**—Drinks are made with crushed manioc or maize mixed with water, or of palm fruits, especially *Mauritia* sp., *Acrocomia* sp., and *Ormocarpus dirichlae*. A slightly alcoholic beverage is prepared of wild pineapples mixed with water.

276 The *Nambicuara* are ardent smokers. They cultivate a tobacco with tiny leaves, which they dry between two pieces of wood, crush with their hands, and store in small calabashes. Cigarettes are rolled in special leaves and tied with grass.

MAGIC AND RELIGION

771 The *Nambicuara* believe in the existence of a diffuse power or substance which may occur in objects and in living beings. It is manifest mostly in poisons, some of which are real (see Weapons, p. 366), some purely magical. To the latter belongs the rosin of the barrigudo tree (a Bombacaceae), which is kept in tubes like the true poisons. When thrown by a special technique at an enemy, it is believed to make him swell like the trunk of the tree and die.

776 There are also dangerous spirits of the bush and of water, which may appear in the shape of an animal, especially the jaguar, or in a

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéra, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákorê and Ouihanierê to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guaycurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoákorê, and who, as now stated, are Nhambiquára. This name of Uáikoákoré is given by the Parecí of the sub-tribes Kazinitî and Uaimaré of the rivers Arinos, Sacuriú-iná, Tahura-iná and Timalatia to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Cabeçal and Jauxú. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of coconut. They wear armlets, braceleta, leg ornaments and head collars made from the fruit of the mbacúba. They live by the chase, but also plant maize, yams, potatoes, mandioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atziri and the Amúsas of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kêtêhê of the Parecí, made from pounded mandioc. The native *breu* or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Oanini and wax, and is preserved in leaves of the Malá-malá palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutúm feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 26 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malá-malá and breu. The upper disk has three orifices.

824 It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

273 Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful [278] to those with open wounds or sores; the same pineapples, when green [757] are good for curing sores, for their juice eats away all the rotten and putrid flesh, and the aborigines know this; in such wise does this fruit [296] eat away, that they use its rind to wipe off the rust from their swords and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

263 The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

262 Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Anungçú!"

261 One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

262 The children are given to eat of everything; no matter what 855 goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

276 Even the stimulants they use--tobacco, for instance--are shared 855 with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

261 which they covered themselves, squatting in a circle beneath the leaves and singing all the while. After a long time they rose, and with the branches still tied to their backs they started dancing around their catch, which was later carved.

115 Unhappily, Gouveia was of an amazing inadequacy. He had lived among them, a captive, for six months; he had actually married an Indian woman, who had tried her best to teach him the language of her forefathers. Yet in the end he fled, bringing back only the vaguest sort of information such as the above, which nevertheless I have deemed proper to record here.

276 Of the stimulants customarily used by primitive peoples, tobacco is the most important [among the Nambicuara] aside from those alcoholic beverages which have already been mentioned.

I have stated earlier that they dry the leaves between two pieces of wood which they stick into the house thatch; when they wish to smoke, they take a leaf and crumble it between their fingers, rolling up the dust in another leaf plucked from a tree which the Cocozu call enandzú.

[238] They also keep tobacco by reducing the leaves to dust which they store in special gourds.

[Fig. 28]

[[77]] Prior to the arrival of the Rondon Commission, the pipe was unknown among the people of the Serra do Norte. Even today they do not like it and prefer their cigarettes, which are small and quite unlike the huge rolls of some Amazon tribes. [Fig. 30]

Their tobacco (Nicotiana tabacum) is mild and pleasantly scented. On journeys they always carry gourds filled with tobacco dust, or sticks with tobacco leaves; if they feel like smoking somewhere along the way, they stop and form a circle. They proceed as if they were about to have a meal and kindle a small fire. When the cigarettes are finished they continue on their way.

They are extremely fond of our roll tobacco, especially when made into cigarettes with pieces of newspaper...

291 The Indians of the Serra do Norte go naked. Both men and
184 women wear a straw cord around the hips. The Cocozu wear bands of embira around the wrists and upper arms, below the knees and

[238]

721 Excitement and enthusiasm decline, and the group returns home.
But some are pushed until realized, [95] and can be very murderous.
726 The Nambikwara usually attack at dawn and extend their ambush by
dispersing throughout the bush. The signal for attack is given from
[534 202] place to place, thanks to the whistle which the Indians carry hanging
from their necks. This little whistle, composed of two bamboo tubes
[136] tied with cotton thread reproduces the cry of the cricket approximately,
and doubtless for that reason has the same name (kalõde) as this insect.

MAGIC, RITES AND RELIGIOUS BELIEFS

278 Some beliefs of a magical and religious character also play
[771] their role in social life. The most important is the notion of
nãnde (bl). To analyze it, we should first say a few words con-
cerning poisons. The Nambikwara are very expert poisoners. They
make curare for their arrows, or at least for some of them, pre-
[415] served in little earthen pots. (1) Without enlarging here upon the

1. The study of the Nambikwara curare was made, on the occasion of our expedition, by our friend and companion Dr. J. A. Vellard. Cf. Vellard, "A preparacão do curare pelos Nambikwaras," Revista do Archivo Municipal de São Paulo, LIX, 1939, p. 5-16; "Communication à l'Académie de Médicine de Paris," id. LVIII, 1931, p. 117-118.

manufacture of the curare, it must be noted that this preparation, although reserved for chiefs and sorcerers, is not surrounded by any ritual and does not give rise to any magical operation. The Indians make the curare publicly, applying recipes and taking precautions which are either essential to the effectiveness of the product or which constitute simple prejudices, but all of which have a positive character. Their attitude towards this poison thus may be considered as scientific. Along with curare, the Nambikwara know other poisons likewise of vegetable origin, and which take the form of powders
[415] contained in small tubes. These are made of quills, feathers, or stalks of bamboo or other wood, cleaned out and corked at both ends with a piece of vegetable pith or cotton, and at times decorated with red dots and lines made with urucu paste. (2) These tubes are

2. Cf. Rondonia. Roquette Pinto collected examples of these tubes and reproduced one of them (Rondonia,

278
[415]

p. 239 and Fig. 34), but seems not to know their usage nor the nature of their content.

usually tied in bundles of two or three or more, and thus all the Indians possess a provision of poison from which they rarely become separated. We were not able to find out anything concerning the preparation of these drugs, but it seems that different varieties exist, used either by men or women. Notably, the poisons whose small doses are contained in the feather quills would be [96] according to an informant, women's poisons, and also much more to be feared. The "tube poisons" (as compared with the arrow poison which is only employed for hunting, and never for war) play an important role in inter-individual relationships. They are the usual instrument for amorous or commercial vengeance. To define these poisons, there are special terms according to dialects. Thus the arrow poison has a special name: inãru (a1); dãdnesu (a2); tiĩre, nãnde (b1); ãĩrare (b2); iriŋã (c). But all of the arrow poisons and tube poisons are called by a more general term, belonging to dialect b1, but which is understood and used by all the groups: nãnde, which one might be wrongly tempted to translate as poison. It must be noted, however, from now on that in the case of tube poisons, the term nãnde means the tube and its contents simultaneously.

789 However besides these "true" poisons which we shall call scientific, there are other substances whose supposed action is of a purely magical character. Certain tubes contain, not a powder meant to be mixed with food, but fragments of resin of the tree called "barrigudo" or [824] "barrigudeira" in Portuguese (Bombax ventriculosa) and sahãrudĩtaãru (a1/2), irĩdare (b1), jakĩŋa (c) in Nambikwara. These fragments are used for certain "magic projections" which are carried out in the following way: a fragment of resin is placed between the lower edge of the palm of the left hand, held horizontally, and the tip of the index of the right hand held vertically (position called iuuehãre [a1]). By exercising strong pressure of the finger on the edge of the other hand, the index trips and throws the small projectile as far as several meters (asataãkedjuzu [a1], adãmdige [b1], ndãmdige [b2]). It is believed that the person reached by a fragment thrown in this way will become like the trunk of the barrigudo tree, narrow at the base and at the top and bloated in the center. He will fall ill, his stomach will begin to inflate, and finally he will die. This method of throwing is also often used for teasing, especially children, and to bombard an adversary with small fruit, with pieces of dirt,

787 These visions are attributed to the thunder which sends them to men under its semi-personal form amõ.

771 Thus the Nambikwara conceive of three types of supernatural
756 forces: first the power which is abstract, but placed in objects or substances, the nãnde; next the spirits acting in the form of supernatural or seminatural animals, atãsu or jaguar. Finally the thunder, with which under certain conditions, it is possible to entertain personal relations. Each individual can, in a certain measure, establish contact with these forces, however it is the shamans who have the specialized function of intermediary between the human group and the supernatural world. The information which we shall give on this point will be very summary, for it was impossible to obtain from our informants a coherent treatment of the question of shamanism. None of the groups encountered had a shaman with the exception of a single one (group c) where the powers of the chief and the sorcerer were found [102] concentrated in a single individual (C20). Our best informant, B1, chief of the allied group, was categorical concerning the fact that C20 combined the two qualities of ŋelikabala (chief, c) and of ndãre (thunder, c) although he was only ŋilikãde, temporal chief. The sorcerer would then be simultaneously the man who identifies himself with thunder, and who communicates with it in the personal form called amõ. Likewise, in the eastern groups (a1 restricted and enlarged, and a2), it was not possible to uncover the presence of a sorcerer or of an individual with such powers. This fact could be interpreted in three different ways: that the sorcerers were held apart; or that they dissimulated their nature; that the institution of the sorcerer is, in fact, absent in certain groups; or that, in these same groups, the functions of the sorcerer are exercised by the chief, and that, in inverse fashion to what is produced in group c, it is the spiritual functions which are in second place with regard to the temporal. It is this hypothesis which we consider the most reasonable. In group a1; A1 makes the arrow-poison and treats sick persons by suction, functions which in group c come within the province of C20 considered as shaman, rather than chief of the group.

756 Whatever the fact may be, and as we have just said, it is the sorcerer who makes the poisons, and it is he who proceeds to the magical treatment of the sick, clearly different from the positive
278 therapeutics likewise practiced. The Nambikwara are familiar with
757 quite a large number of medicinal plants and treat certain illnesses with their help. Thus they care for purulent ophthalmia by an

injection of pao preto (ikãtu nẽ̂ʂeram, a1), put in the eye with the aid of a funnel of leaves from whose lower extremity the liquid falls drop by drop. But other maladies, considered the result of poisoning (or of a charm; in both cases: nãnde) are exclusively within the domain of the sorcerer. He makes the "arrows of thunder" (ndaɑ̃rede, b1) in all points similar to those used for hunting except that their dimensions are much more restricted. The treatment consists of three operations: throwing the arrows around the sick person to carry away the spirits; sucking the body to force out the cause of the illness; this cause is thrown far away when it has been captured:

43. ãdige underãdige kadirɨ̃nka ũngeraige tenũndige (b1)
throw, throw far away the little thorns sucked with the mouth, throw away [the evil]. (1)

1. The informant made it known that by "little thorns" he meant to designate the "arrows of thunder" which are only several centimeters in length. One notes the same assimilation in other regions of South America. Thus, the informant of Karsten in the Chaco (R. Karsten, "Indian tribes of the Argentine and Bolivian Chaco," Societas Scientiarum Fennicae, Commentationes Humanorum Litterarum, IV, 1, p. 132-133) cites as the cause of the malady and the way of combatting it, an "arrow" or "splinter").

[103] Afterwards the sick person is usually cured and can take up his work again:

44. enẽndige deẽndige enẽnə deẽdnige (b1)
To be sick is finished [one can] continue.

However, the sorcerer can establish much closer relationships with the supernatural powers. During our stay in his group, C20 disappeared, or more exactly did not return to camp at the usual hour. The other men, having gone hunting, had not seen him the whole day. Night fell and toward nine or ten o'clock in the evening, the most profound consternation reigned in the camp and particularly around the fire of the man who had disappeared, whose two wives and child held themselves embraced while mourning in advance the death of their husband and father. At this moment we decided to look around, accompanied by a few Indians. We had only to walk 200 meters to discover C20, crouched on the ground and shivering in the darkness. He was completely naked, that is, divested of his

He was completely naked, that is, divested of his
756 necklaces, bracelets, earrings, and belt, and by the light of our
[301] electric lamps we could make out his tragic expression and his pale complexion. He let himself be helped to the camp without difficulty, where he sat down without a word and in a completely impressive attitude of dejection. Little by little, his story was drawn from him by an anxious listener. He explained that he had been carried off by the thunder (amõ), [a storm had broken the same day]; the thunder had carried him in the air to a point which he designated at a distance of 25 kilometers from the camp (Ananáz River), had divested him of all his ornaments, then brought him back the same way and left him in the place where we had discovered him exhausted. Everyone went to sleep commenting on the incident and the next morning, C20 had recovered not only his habitual good humor, but also all his ornaments, which amazed no one and for which he offered no explanation. But the following days a very different version of the event began to be peddled by the Tarundé. They said that, far from having entered into relationship with the other world, C20, under the cover of a magical disappearance, had gone to undertake
[578] some transactions with a band of Sabané Indians who were camping in the vicinity. These insinuations were never developed further, and the official version of the affair continued to be ostensibly admitted. However, in our personal relationships, B1 let his preoccupations be seen upon several occasions. As the two groups left us shortly after, we never found out the outcome of the story.

756 No information has been uncovered concerning the manner of
●278 naming the shaman as such. In the preparation of the arrow poison, C20 was assisted by his potential son-in-law C25.

* * * * * * *

622 [104] Besides his supernatural attributes, the chief, or shaman,
756 plays another role, that of "leader" in ceremonies and celebrations.
796 The Nambikwara have three types of ceremonies. Those which mark the critical moments of each one's existence, such as birth, initiation, puberty, marriage, death; the seasonal festivals; and finally, the ceremonies celebrated on exceptional occasions: war and hunting or scavenging expeditions. We have already alluded to the rites of war, and we shall speak farther on of the ceremonies of the first type. We shall limit ourselves here then to some brief observations concerning the others.

had been poisoned. An attack of reprisal was carefully prepared and took place, in the course of which A1 and A5 distinguished themselves. The six persons composing the mission were killed by beating or pierced with arrows, including a baby of two. Only one woman was found alive by an expedition sent to aid them from Cuiabá. The version which she gave of the events coincides exactly with that which we collected from the main protagonists of the other camp. 177 648 797 [726]

Poison was still to play a role in the life of A6, and this during our stay. We found ourselves visiting (August 1938) at the camp of a neighboring group (a2), and relationships became quickly strained between A6 and our hosts, undoubtedly over the question of women, so that he got the habit of coming to my camp to seek a more friendly atmosphere, at the same time that he shared my food. This fact was noticed, a delegation of four men came to find me one day, and in quite a menacing tone of voice told me to mix some poison (which they brought me along) in the next dish which I would offer to A6; they thought it advisable and indispensable to do away with him at once, for, they told me, he is "very wicked" (kakore) and "is worth nothing" (ajdotiene). I had the greatest difficulty in getting rid of my visitors without opposing them with a refusal which in turn would have exposed me to animosity which I had just learned it was better to avoid, and I considered my best plan of action to exaggerate my ignorance of the language, and to feign obstinate lack of comprehension. After several attempts, my visitors retired very disappointed. I warned A6 who immediately disappeared. I was to see him again only four months later. 278 578

These incidents are characteristic of Nambikwara psychology. The Nambikwara are very open, confident and spontaneous, but they are very sensitive and react with great violence to deception [125] or disappointment. Few primitives are as easily accessible. Few give as free access to their intimate lives, to their beliefs, daily acts, thoughts and sentiments. But despite this facility and cordiality, the visitor, be he an ethnographer or a member of a neighboring tribe—must constantly be on guard and watch his actions; for the slightest imprudence, the least clumsiness, may incite reactions difficult to evaluate among his hosts, and in connection with which recent events are always present to recall that they may be extreme. A6 offered a perfect example of this confidence and spontaneity, allied with brusk manifestations of violence and irritability. 157 648

Thus, the Nambikwara character alternately presents two aspects, or more exactly, testifies to a double nature: one which we shall call positive, and which goes much farther in this sense than among many Indians in contact for centuries with the whites; and the other, of metaphysical nature, whose rigor and exaltation at times evoke the mysticism of the North 157

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

string (secondary release). Four types ot arrows are used: (1) featherless fishing arrow with three to five prongs; (2) bird arrow with a blunt point; (3) big-game arrow with a lanceolate bamboo point; and (4) poisoned arrow, used chiefly for hunting monkeys, with several barbs which are attached to the point with cotton wrapping and which break easily in the wound, being, therefore, usually protected by a bamboo sheath. The last three have a bamboo shaft and "Arara" feathering. Sewed feathering is known by the central and northern groups but seldom used. For warfare, big game arrows with serrated bamboo points are used.

Nambicuara arrow poison is a curare prepared by grating the root of a *Strychnos* shrub, and by infusing (*Eastern Nambicuara*) or boiling (*Central* and *Northern Nambicuara*) it until the water evaporates and leaves a thick brownish substance, which is smeared on a wax-coated arrow point. It can be preserved in tiny pots for several months. Among South American arrow poisons, it is remarkable because it is made of only one vegetable substance and is prepared openly—in some groups by the chief or shaman, in other groups by anyone—without magical practices or taboos. Its great toxic properties were studied by Vellard (1939 b).

Other poisons of unknown composition are used for amorous or political revenge. They are in the form of powders and are kept in tubes made of feather quills, bamboo, or other woods, each ornamented with paintings and cotton or bark wrappings.

Clubs are carved in the shape of a flattened or cylindrical pointed spade; the handle is often adorned with black and white plaiting of philodendron bark and bamboo strips. Their purpose is mostly ceremonial.

SOCIAL AND POLITICAL ORGANIZATION

Kinship terms identify parallel-cousins with siblings, and cross-cousins with potential or actual spouses. Cross-uncles and cross-aunts are called by the same terms as parents-in-law and grandparents; parallel-uncles and parallel-aunts are equated with parents. Similarly, parallel-nephews and parallel-nieces are classed with children, and cross-nephews and cross-nieces with children-in-law. Marriage is between cross-cousins or between the maternal uncle and his niece. Monogamy is the rule, but polygyny is the privilege of the chief and other important men. Polygyny is usually with several sisters (sororal) or with a woman and her daughters by a former union. The first wife runs the household, subsequent wives being assistants to the husband. The deficiency of available women which results from polygyny is compensated by homosexuality between adolescent male cross-cousins (Lévi-Strauss, 1943 a).

The village is ruled by a chief, but each of the nomadic bands into which it splits during the dry season is led by a secondary chief. Chief-

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

224 to me not to say anything. Later that day he
264 returned to the spot, built a fire, roasted the snake, and ate it by himself.

224 Caymans are hunted by first finding their hide-outs under logs or overhanging banks. When one is found under an overhanging bank the hunters peel a number of slender poles and begin to thrust them down through the bank to force the cayman out. Men are stationed above and below the spot, and as the cayman comes out he is shot. When he hides under logs the hunters feel for him with their feet. The hunters are so nimble that few of them get bitten. The large rodent, paca, is also hunted in this way, for it hides in holes under overhanging banks.

The large water snake, anaconda, is hunted in pools where it lies in wait for game. When the hunters have trailed an anaconda to a water hole they keep shooting arrows into the water until they strike it. The first strike then indicates where the snake is, and they continue shooting until the snake weakens and can be pulled out. Sometimes the snake grabs a hunter by the arm, but the others are there to assist if anyone gets into difficulties.

Small anteaters are dug out of holes but the larger kind which does not go into holes is hunted by two men armed with clubs. The men chase it, one on each side, and as the anteater turns on one he strikes it on the nose with his club and then jumps into a tree. The other hunter then strikes it. This continues until the anteater dies.

Monkeys are chased from tree to tree until they tire and come down to hide in a hole in the ground. Dogs can then overtake the monkey or he can be shot or dug out of the hole. Deer usually do not fall when shot, but the hunter chases the wounded deer until he can shoot more arrows into it, especially into the legs.

[278
184] Although the Western Nambicuara are said to use arrows poisoned with curare, the Wakítisu say they do not use curare but that they know how to prepare it and that they formerly used it in raids. As arrows do not penetrate bone, the hunter tries to shoot at an angle so that the arrow will enter the chest cavity, or he will aim between the neck and the shoulder bone.

223 The Nambicuara hunt and eat all birds except the urubú. Large rheas are not hunted because it is difficult to approach them on the open sa-

baked manioc and other food which they have been preparing. When the messenger leaves with the food it is a sign that the men will return to camp after sunset.

Before the men arrive the women wash the girl and paint her with a mixture which includes latex from the rubber tree. A series of dots are painted on her face, breasts, abdomen, and thighs (pl. 6, *c* and *d*). When the men come in they dance in front of the girl's hut. She then comes out and is given a name and everyone tries to give her a necklace or some other object. During the night men and women join in the dance, holding hands and dancing in a circle, the dance steps being stamped out with the right foot in the direction in which the circle is moving. A special puberty song is also sung.

The Nambicuara tell of a strange medicine known only to the shamans which is given to girls during the puberty ceremony. It is a blue liquid which, when taken internally, stops menstrual bleeding for the remainder of the girl's life. The Wakĺtisu claim that they do not use it but that the other Eastern Nambicuara band do. The missionaries informed me that the Kitánrhu use this medicine, and the missionaries seemed to think that it was effective.

MARRIAGE

There is no special marriage ceremony, for when young people go through the puberty rites they are ready for marriage and a mate is selected for them by their parents. The young man, who is to become the husband of a girl just out of seclusion, goes to her parents and helps his future father-in-law build a small hut, and when it is finished the young man tells the girl to come out hunting with him. She takes a burden basket and they go off into the woods. In the afternoon the man builds a fire and tells the girl to prepare some food and honey. After the food has been eaten he tells the girl to come and lie beside him near the fire. She is supposed to resist and he takes a stick and threatens her. He then has sexual intercourse with her, and when they come back to camp that night they are accepted as a married couple. When wives are acquired by inheriting the widow of a brother or by abduction from other bands, no ceremony is held.

INDIAN TRIBES OF NORTHERN MATO GROSSO, BRAZIL—OBERG

WILD PLANTS USED IN MANUFACTURE—Continued

[p. 125]

164 These papery scales cannot be removed easily; I noticed that they did not come off when the woman scratched herself. I believe that the itching is much less severe at this time; it seemed more intense during the initial stages.

I cannot be definite about the time span of the disease. The symptoms evolve in a few days from the first to the second stage, but the latter seems quite prolonged.

[183] Some of the scabs contain incipient papery scales. However, as I had the opportunity to see only one woman and one girl, her daughter, whose bodies were entirely covered with the lesions of the last stage, I believe that the disease does not always reach this point. It may remain stationary at the second stage, or it may recede [involuir].

For the time being, therefore, I ascribe three stages to the disease:

(a) the cyst stage
(b) the scab stage
(c) the scale stage

I believe that these correspond to evolutionary phases of the same disease, and not to different diseases, because I found transitional forms on some of the affected individuals.

Besides, [the Indians] indicated by means of very clear signs that the final symptoms began with the cyst stage, the only one found in nursing children.

[757] The Indians spread saliva on the scabs; we do not know yet [278] whether they use any herb against the disease. They probably do, for veritable herbariums were found in their villages.

302 751 Another question that remains to be solved is the possible effect on the disease of the Indians' custom of painting their body with a greasy paste made from the juice of the urucu seeds. (1)

[113]

1. Alvaro Osorio de Almeida (in the Boletim do Museu Nacional, Vol. 7, 1931, No. 1) studies the reactions of skin painted with urucu to the actinic rays of light and to solar heat. His experiments led him to the following conclusions:

"Once smeared with urucu, the

824 It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

273 Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful [278] to those with open wounds or sores; the same pineapples, when green [757] are good for curing sores, for their juice eats away all the rotten and putrid flesh, and the aborigines know this; in such wise does this fruit [296] eat away, that they use its rind to wipe off the rust from their swords and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

263 The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

262 Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Anungçú!"

261 One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

262 The children are given to eat of everything; no matter what 855 goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

276 Even the stimulants they use--tobacco, for instance--are shared 855 with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

[113]

1. Cf. E. Roquette-Pinto, "A condição da criança entre os Indios do Brasil [The Status of the Child Among the Indians of Brazil," Primeiro Congresso Americano da Criança [First American Congress on Childhood] (Tucumán, 1916).

241 [Plates p. 254]

[249] Yet a wild form of manioc has been found (Manihot utilissimo, Pohl); if not the very species we use, at least one of the same genus. But maize?

Where on the surface of the earth does maize exist in a wild state except for the tunicated Zea mais which is sometimes considered to be the ancestor of the modern species?

What unveiling of mysteries, if this question were to be answered!

Some Tagnani who were watching the herdsman João Lucas weed a small plot in Três Buritis began to laugh at him, indicating that it would be better to root up the weeds; the hoe severed the stems but left in the roots, and the plants would grow up again. When the Nambicuara weed, they pull out everything that is not useful. Their plots are always clean.

Their tobacco is the Nicotiana that grows wild in their mountains; it may not properly be said that urucu and cotton are cultivated: they are planted and utilized. Some large beans of various kinds de-
278 241 serve mention. [250] They are to be found in the Indians' baskets along with many other plants; but we never saw an Indian eating them or making any use of them. Pending further research, I am of the opinion that they are saved for medicinal undertakings carried out in secret by old men and women. The same may be said of the castor oil plant (Ricinus communis), which is definitely adventitious.

[Fig. 39]

415 The spools of cotton fiber that await spinning and the seeds saved for future use are kept out of the weather, dust and rain in bags made of straw or pacova leaves.

[Fig. 40]

759 It seemed to us that medicine was not exercised by any special segment of society. They all take part in the treatment of certain diseases; in serious cases, an experienced elder takes over.

752 Wounds are dressed with straw fibers [coated] with certain resins (jatobá). Burns are treated with cold water. Fractures and dislocations are reduced haphazardly.

4/1 4) Chaco; 5) Eastern Brazilian.]

171 Nambicuara bows must be placed in the second group on account of their cross-section, which is indeed quite similar to that of Mundurucu bows. Their twine is coiled in the manner of Meyer's Perutypus group.

[Plates p. 248]

[271] [Fig. 58] Meyer classifies Brazilian arrows into seven groups, now insufficient because other types have since been found, but which nevertheless cover the principal characteristics of our arrows. His classification is based on the feathering of the shaft. [1) Eastern Brazilian or Tupian-Ge; 2) Guiana; 3) Xingu; 4) Arara; 5) Maue; 6) Peruvian with fibers; 7) Peruvian with resin, where Nambicuara arrows belong.] This last group is further divided in two: a northern division covering the Amazon Valley, and a southern division covering the Chaco region. The feathers are slit lengthwise, their stem scraped until only the outer layer remains; [272] they are tied spirally to the shaft by means of twine and black resin.

[Fig. 55]

4/1 Our collection includes war, hunting and fishing arrows. It must be noted, however, that these distinctions are not always maintained; when necessary, the Indians use all three types interchangeably.

Aniêçú: The tip is of red wood, cylindrical, smooth; used to hunt monkeys.

[Fig. 56]

Uaeliçú: The tip is sharp, made of taquaruçu bamboo (Merostachys sp.); used in war and to hunt large game--capybara, tapir, jaguar. . . . .

Aieuinçú: The tip is smooth, with a barb at the end.

[Fig. 57]

4/1 [273] Anikirikatçú: A unique type, armed with a series of
278 barbs secured with twine and pitch. It is coated with a black substance which the Indians believe to be poisonous; for this reason, they protect the tip with a bamboo sheath. It is a war weapon. The "poison" of Nambicuara arrows is harmless... (1)

1. [Alvaro Osorio de Almeida notes here that he carried out an

411
278

experiment with the resinous, supposedly poisonous substance found on the tip of one of these arrows. He injected a concentrated solution of it into frogs and guinea pigs, and the only resulting symptoms were muscular twitchings, unsteady gait, and some salivation.]

[Fig. 60]

411 Aieracú: The tip is blunt; it is used to stun birds that are to be caught alive or free from blood, which stains the feathers. [See fig. ... (59), p.55A] Often a smooth tip wrapped in a straw pellet is used for the same purpose.

[207] [274] Some unique fishing arrows have a double, triple or quadruple tip and a bone barb. [See fig. ... (37), p. 36B.] Some have feathers at the base, others do not. . . . .

All Serra do Norte arrows have shafts made of thin bamboo. The various parts of the weapon are secured with strips of the strong [209] imbé lianas (Philodendron imbe, Mart.).

[Fig. 61] The clubs are extremely crude weapons of attack and defense, mere portions of thick branches cut when the occasion demands it.

[324] [275] The axes of chipped stone are uniform in type. They are wedge-shaped, made of diorite, and they average two kilograms in weight. The handle is a piece of creeper stem, perhaps from a Bauhinia. The pitch and cord used to fasten the stone make the tool surprisingly strong. . . . .

381 The pitch is made of mastic resin, jatai (Hymenea stigonocarpa [324] or H. stilbocarpa), and wax, as well as other unknown substances. It is placed in pots and subjected to the action of fire, then kept in pellets fastened to embira strips or in loaves wrapped in leaves. Both the arrow "poison" and the axe pitch are called by the name of dukutaarú, which means "wax."

[Fig. 62]

273

Fig. 60. Poisoned arrow (anukiritatçũ) with protective sheath.

226 Tephrosia toxicaria is a poisonous legume, a kind of tingui
824 [Lupinus cascavella] used in fishing.
278 They are not familiar with the fishhook, and use [276: full page of figures] [277] a sort of fish trap made with bamboo or with the stem of the titara liana (Desmoncus sp.).
262 The following foodstuffs are represented in the collection.
--Guaiatú: white maize.
--Urinodzu: manioc dough, which under microscopic examination proved to be very rich in starch grains. The root, once grated,
252 [115] is pressed [by wringing] with a straw cord, the çaaru. (1) The grater

1. [Heloisa Alberto Torres notes that the cylindrical tube used to press manioc by some Amazonian tribes must have spread from the Guianas to the valley of the Amazon. Métraux considers the woven band used for the same purpose and found on the periphery of the tube territory a more primitive form. The simple straw cord of the Nambicuara would thus constitute an even more primitive variant.]

is of the type used by the Xingu Indians (Suya, etc.). It consists of a board with about two [twenty?] rows of small sticks.
[Fig. 17]
262 --The larvae of a butterfly, which they eat alive.
--Katunuzú: anthill clay, which they also eat.

. . . . . .

[824] --A mushroom, orelha de pau (Polyporus sp.), which is eaten, and beans (Phaseolus sp.) of unusual aspect were also found in one village. [278] The smoked [moqueada] head of a great anteater was
[251] found in a basket by Miranda Ribeiro during the 1909 expedition.
415 Mortars (nutêzê) are hollowed out by means of fire and used to
252 pound meat and other foods.

372 They make fire with mastic resin sticks, the tips of which are wrapped in straw to protect them from the rain.

[Fig. 63]

241 415 Their plots are worked with pointed sticks. The seeds of urucu, gourd plants (Lagenaria) and cotton are kept in leaf containers.

278 824 Medicinal fruit (Solanum mammosum) is also saved, as well as roots, leaves, etc.

[Fig. 31]

386 The collection contains two samples of dyes: a paste of urucu and fat, sweetly scented, which the women use to paint their body after the bath (huduhukaidi); and a variety of red ocher. [279]

248 Cotton (1) is represented by seeds (rim de boi variety) in leaf

[17]

1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Andes and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[283 236] containers; cotton thread (kondzú) from a spindle (gdaretatú); skeins [855] of spun cotton; cotton fabric (sareguêzê--strap used to carry children).

[283] The spindle is made of a palm splinter imbedded in a round potsherd.

[Fig. 64]

415 924 Kateçú are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

[See fig. ...(28) p. 308.]

/211/

114
278 Numerous travelers and physiologists have concerned themselves with curare without succeeding in exactly determining its nature and its method of preparation. For some curare is purely vegetable; for others it appears to be composed largely of animal materials. Without analyzing here all the literature on this subject, it will be enough to recall that most former authors and travelers of the past century name diverse species of Strychnos as the principal base of curare; many other plants belonging to various families have also been mentioned as possibly entering in this poison. The partisans of an animal or mixed origin for curare, practically all travelers, assert that the venoms of snakes, batrachians, and arachnids, and fish and insect extracts, etc... play an essential role in its preparation. Despite numerous opinions to the contrary the presence at least of certain venoms in some curares (1) is indisputable.

[113]

1. Vellard and Assis, "Études immunologiques sur le curare /Immunological Studies on Curare/," Annales de l'Institut Pasteur. Paris, LII, 102, 1934.

Often these controversies on the composition of curare have lost sight of one essential fact. Curare is not a set substance and does not correspond to one single formula. There is not one but a number of curares, more or less complex, peculiar to each region, each tribe, and in many cases to each preparer.

Besides it is the general but false practice to call every paralyzing arrow poison of South America curare. The application of this term should be limited, in accordance with its classical physiological definition, to any poison suppressing the passage of excitations of the nerve to the muscle while preserving direct excitability of the muscle and that of the motor nerve.

/211 cont./

114 True curares are becoming difficult to find. Many of the
278 modern products brought back as curares or existing under this name in /212/ trade are paralyzing poisons of variable toxicity but with a weak or no curarizing effect. The curarizing effect itself does not interest the Indian; he is only looking for a halting poison producing rapid paralysis with loosening of muscular tonus, no matter by what mechanism, for his arrows. Often also the good faith of travelers has been betrayed and the Indians, anxious about their secret, have given them false recipes or poisons different from true curare. Lastly, some curares are hard to preserve, making it impossible to ascertain their properties upon the return of expeditions.

These causes, so diverse, have always left doubt about the exact composition and method of preparation of curare.

I. Curare of the Ñambikwara /Nambicuara/

During my last trip to the central plateau of the Mato Grosso with my colleague Lévi-Strauss, I was present at the preparation of a very simple but active curare by the Ñambikwara and accompanied these Indians on the search for the necessary plants.

Curare had not been mentioned as existing among the Ñambikwara. The Rondon Commission had certainly observed the existence of an arrow poison among them, but later investigations carried out on arrows sent to Rio de Janeiro had given negative results (Alvaro Ozorio de Almeida and Roquette Pinto). The cause of this failure can only be attributed to the material used in the experiments, which was too old; the arrows keep their activity only a few weeks.

278 The composition of curare is the same for all the
184 Ñambikwara, but its method of preparation varies from group to group. It must be emphasized that the preparation of this poison is surrounded with more mystery as one goes toward the

/212 cont./

278 184 southern boundary of the territory of these Indians toward the Amazon. Among the most remote Ñambikwara, those on the right bank of the Rio Juruena whose material culture is extremely poor and who do not have a sorcerer, all the men know how to prepare curare. Among the Tagnani living in the region of Campos Novos and the Rio October 12 and the Çabanè living between the campos of Vilhena and the Rio Commémoration, the preparation of curare is reserved either for the chief or more often for the sorcerer (Çabanè). The Tamandé of the Roosevelt River have refused to give any precise information on curare, the preparation of which is the exclusive prerogative of the sorcerer; their arrow poison, which I was able to study, is identical to that of the other groups. The Ñambikwara of the Cabixi River also use curare, but I did not obtain /213/ any details about its preparation from these Indians, who visited our camp but spent only one evening there.

278 126 I was present at the preparation of curare for the first time among the Ñambikwara of the right bank of the Rio Juruena.

[114] Among the objects gathered for our collections were several poisoned arrows. The first experiments carried out on various animals either with the arrows or with the wash-water of the points revealed a symptomatology recalling that of curare.

[116] [117] Our two chief informants, who were called José Maria and Julio by the civilized people, were influential personages in the group and the principal authors of the massacre of the North American, Protestant mission of the Juruena in 1930.

[123] Patient negotiations led them to show me the plant used by them, and then a little later, to let me be present at the preparation of the poison itself.

Not without fear of being hoaxed, I tested the prepared product: its action was identical in every respect to that of the arrow poisons. The Ñambikwara had been honest.

[114] [162] Two months later in the campos of Vilhena the Çabanè sorcerer, who belonged to the mixed group composed of the

/213 cont./
278 126 [114] [162]
last Çabanè-Tagnani survivors, again showed me the complete preparation of curare. All the information gathered in the various Ñambikwara groups visited agrees with what I was able to observe.

In possession of these facts I prepared several times a certain quantity of curare identical to that of the Ñambikwara. The action of these different samples was tested in the field in order to be used in comparison with later experiments upon the return of the mission; thus any possibility of error due to a possible alteration of these products was eliminated.

A year has gone by since this time, and the various solutions brought back have kept their activity; they made it possible to examine rigorously their curarizing properties.

Preparation of Curare

278 824 Plant. Ñambikwara curare is prepared with only one plant, a Strychnos which grows in the sandy brushwood of the central plateau of the Mato Grosso. Although not rare this species is not abundant anywhere.

It is a bush two meters high (Pl. III, A), with a rather strong stem and downward-hanging branches, more or less sarmentous and sometimes changing into tendrils at the ends; I never saw a really twining example of this species. The branches have a reddish bark, /214/ without thorns, which is covered, as is the stem, with white concretions. The leaves are elongated and small or medium in size. The species is very polymorphous. No specimen bore flowers or fruit.

The Strychnos group is one of the most difficult to study. Many species rarely flower, and in the absence of flowers it is often impossible to identify them.

In certain features the species of the Ñambikwara is comparable to St. medeola. It exists in the plant collection of the Rondon Commission, but also without flowers and undetermined.

/214 cont./

278 824 Only the bark of the roots impregnated with a reddish, gummy juice is used in the preparation of curare. The plants which grow in sandy places are considered to be richer in poison; they are recognized by the bright red color and moisture exuding from incisions made in the bark. Roots from clayey earth are dry and considered incapable of giving an active product.

The Ñambikwara of the Juruena consider it essential to gather the roots in the morning at dawn before the sun gets too hot, and they only use fresh bark. The Çabanè use dried, stored bark by preference.

Çabanè Curare

278 The preparation of Çabanè curare may be taken as typical. It comprises three main operations: draining of the bark in portions with fresh water; rapid boiling to rid the product of some of its impurities; slow concentration at low heat.

[412] Immediately after their harvest the roots are washed and then scraped with a splinter of bamboo or a piece of iron to detach the bark. Small, very fine shavings are thereby obtained which are dried and kept in baskets or gourds.

[413] Draining of the bark. The bark is placed in a small, elongated basket (kọnọsimatá) of bamboo lamellae reinforced by large leaves (kọnọkọnọsi) and hung by two vertical supports over an earthen dish. Over the bark they pour 200 to 250 cubic centimeters of cold water; a blood-red liquid filters off slowly. The filtering takes 15 to 20 minutes; when it is almost over fresh water is again poured over the bark. This operation is repeated six to eight times until the bark is exhausted (Pl. IV, A-B).

[412] Boiling on a brisk fire. After each operation the liquid obtained is poured into a receptacle placed directly over a strong fire; it is constantly /215/ stirred with a wooden spatula and does not take long to boil in large bubbles. When it

/215 cont./

278 threatens to overflow it is removed from the fire for a second and then put back to boil. A thick, reddish scum forms which [412] holds the largest impurities; it is removed as it appears with a straw from a palm tree (Pl. V, A). After five to ten minutes on an average the boiling diminishes; the liquid turns brown and begins to thicken. It is then taken from the fire and [415] poured with the aid of a funnel (kǫ̈li) made from a rolled leaf into a new receptacle to be concentrated (Pl. IV, C).

[415] [172] Concentration. The concentration is done in a receptacle (here, a tin can from the mission) suspended 40 or 50 centimeters above a small fire, into which successive portions of liquid are added as they are prepared. The concentration takes two to three hours. According to its degree /of concentration/ they obtain a thick blackish-brown liquid, reddish when looked through, ready to be applied to the arrows with a straw, or a black paste which becomes very hard on cooling and can be kept for a long time. Before being used this paste must be softened at low heat.

The Çabanè recommend that one not touch the curare with the fingers nor even breathe the steam from it during the boiling. This hypothetical toxicity of the steam had already been noted by former travelers; it was even asserted that these emanations were so dangerous that the Indians had the curare prepared by old women who almost always succumbed to it. One can see (Pl. V, A) that the Çabanè sorcerer is not afraid of it.

Curare does not enter healthy skin, and the Ñambikwara of the Juruena press the water-soaked bark between their hands, taking the sole precaution of washing immediately afterward. The steam that I voluntarily inhaled never caused me the least sickness.

[192] The Çabanè call curare and the plant which produces it iríwa, and the still unconcentrated liquid from soaking iriwiya. The Tagnani name the plant and the curare naⁿdé.

/215 cont./

278 Curare of the Ñambikwara of the Rio Juruena

The technique of the Ñambikwara of the right bank of the Rio Juruena is more primitive.

They use only bark which has just been gathered. The draining off of the bark is done only once and with warm water: the bark /216/ is put on the fire in a rather large amount of cold water, and the operation is ended when the temperature reaches 37° to 40° /centigrade/. It is filtered quickly by squeezing the bark with the hands to extract all the liquid from it. Then comes rapid boiling over a high fire and skimming. After several minutes of a rolling boil the fire is lowered and the liquid kept at a temperature a little below boiling until it has a pasty consistency.

[415] [237] The curare is kept in paste form in bamboo tubes or changed into a very hard mass by the addition of meliponine beeswax.

This method exposes the curare to strong heat for at least two hours. The Çabanè method reduces this time to ten minutes, the other operations being carried out at low heat. Both produce curares with about the same activity.

[192] [411] The Rio Juruena Ñambikwara call curare and the plant a'utĭsú or a'ukisú; the roots ta'ãdisú; the poisoned arrow aurũ kiritkatsú, and its protective bamboo sheath aşirikatsú.

Utilization of Curare

278 411 The Ñambikwara are not familiar with the blowgun. They use curare to poison large arrows with long, notched points, capped with a protective bamboo sheath. The points of the Tamandé curare arrows are shorter and more slender than those of the other Ñambikwara. They are usually placed in twos, threes, and fours under a single protective sheath.

According to the Indians an arrow's activeness does not last more than three or four months. The curare in paste form is kept for a longer time (close to a year). Hard curare can be kept for years.

/216 cont./

224 The poisoned arrows are intended for hunting certain ani-
278 mals, some large birds, cervids, and especially monkeys.
411 Birds wounded by one of these arrows fall almost immediate-
[203] ly.

A monkey mortally wounded with an ordinary arrow or even a bullet often remains hanging from the branches. Under the action of curare it holds itself immobile at first, then begins to tremble and falls several minutes later (five to 10 at the most) as soon as paralysis is produced.

A peccary or small deer such as the Cervus campestris wounded in the body runs for one or two minutes, then stops exhausted, is attacked by tremors and lies down.

The tapir, very large, resists a long time; it can run for two hours before stopping; hence the Indians do not hunt it with curare.

[262] /217/ The meat of animals killed with curare may be
[263] eaten without harm; the Ñambikwara of the Juruena content themselves with cutting away the flesh around the wound impregnated with poison and colored yellow; the Çabanè do not even take this precaution.

278 Poisoned arrows are also used for war; this is perhaps their
411 principal object among many Ñambikwara groups, who possess
726 only a very few specimens during normal times.

None of the Indians know of an efficacious antidote. According to our informants wounds in the trunk would always be fatal to men. By immediately drawing out the arrow, it might be possible to survive a wound in a limb; in order to make their extraction more difficult, the points of the poisoned arrows, especially those of the Çabanè, are very lightly attached to their shafts.

/217 cont./

Properties of Nambikwara Curare

●278 The toxicity of Nambikwara curare is high. Among mammals and birds it provokes an initial sensation of unlocalized irritation accompanied by cramps; the animals are restless and scratch themselves sometimes on one part of the body and sometimes on another. Then tremors appear, at first localized in certain groups of muscles, and then becoming general; in some cases they appear in the form of sudden, intermittent muscular jerks; at a more advanced stage certain muscles begin to fibrillate. Finally paralysis appears; the animal presents a progressive asthenia; it becomes immobile, avoids all movement; soon its paws give way, it sinks down, and the paralysis becomes complete.

The swallowing muscles and those of the larynx are reached very early in the dog; its voice becomes faint, its tongue hangs out of its mouth, saliva is no longer swallowed. The tendinuous reflexes disappear first, followed by the ocular reflexes. At the beginning breathing is accelerated, panting; the respiratory movements slow down very rapidly, diminishing in extent; periods of apnea appear, varying for dogs from ten to 50 seconds, and coming closer and closer together. After breathing definitely stops the heart continues to beat for several more minutes. Autopsy has revealed only ordinary lesions of suffocation and a greater or less extended yellow coloration of the muscles at the points of injection.

Claude Bernard's experiment, using a frog, one foot of which was isolated from the general circulatory system by a ligature cutting off the sciatic /nerve/ shows that after an injection of curare into the dorsal lymphatic sack /218/ the mobility of the isolated foot and retention of nerve excitability are preserved.

The curarizing action has been studied in a more precise fashion with solutions brought back with the help of ordinary

/218 cont./

278 inductive apparatus and with the usual equipment for the study of chronaxie at the laboratory of M. Miguel Ozorio de Almeida at the Institute Oswaldo Cruz of Rio de Janiero.

It is known that the South American pseudo-frogs are curarized with difficulty and in an incomplete fashion; toads in contrast the Bufo marinus among others, constitute choice reagents.

After 15 minutes the Bufo marinus (30 to 40 gr.) present perfect curarization, with doses from 0.01 to 0.05 cc. of liquid curare injected into the ventral lymphatic sack: the gastrocnemii no longer react to excitation of the sciatic /nerve/ by the discharge of condensers of five microfarads, nor even to that of a six-volt battery, while keeping their direct excitability.

Lizards are very sensitive; 0.001 to 0.01 cc. curarize Anolis or Tropidurus of average size.

An intramuscular injection of 0.2 cc. paralyzes a hen in two minutes and kills it in 15 to 20 minutes; 0.05 cc. produces a paralysis which only disappears after four or five hours.

Mammals are particularly sensitive to this curare.

A dog of eight kg., having had the end of an arrow point (45 mm.) in his thigh muscles for 15 minutes, immediately after being wounded had tremors localized at first in his forequarters, then they extended to his dorsal muscles. Three minutes later the animal fell; paralysis was complete after 12 minutes; pupillary reflexes disappeared in 15 minutes, the time when the arrow point was extracted; the definite stoppage of respiration occurred in 41 minutes, and the heart stopped three minutes later.

A ten-kg. dog who had received an intramuscular injection of 0.25 cc. of solution in its thigh displayed immediate restlessness and generalized irritation; in three minutes tremors began in the forequarters. The animal staggered (4"), then fell paws outspread (5"). Paralysis of the voice in six minutes and

N 278 /218 cont./ panting respiration; eight minutes, repeated muscular jerks in the forequarters; nine minutes, total paralysis, disappearance of the pupillary and corneal reflexes, tongue hanging out of the mouth; ten minutes, the first periods of apnea; 13 minutes, definite cessation of breathing; 15 minutes, heart stops.

There is no point in further stressing here the physiological action of the arrow poison of the Ñambikwara. These few observations suffice to /219/ show that we are dealing with a genuine curare and not with a simple paralyzing poison. Compared with a former curare, in a jar labeled "Indios tapuios du haut Rio Negro /Tapuio Indians of the upper Rio Negro/" Ñambikwara curare has shown itself considerably more active. It distinguishes itself from the classic curare of the Ticuana by the muscular tremors which it produces at the beginning of the poisoning among all the mammals studied.

II. Curare of the Pareci

P 278 P [192] The Pareci Indians, not very numerous and very civilized today, were acquainted with curare. They give it, with almost the same accentuation, the same name as the Çabanê: iriwâ.

P [124] [126] I was not able to obtain any as the Pareci no longer prepare it; the information on it was given to me by some middle-aged Pareci, who had spent their youth in some villages which were still independent at this time where the men used this poison.

The chief ingredient was the Strychnos used by the Ñambikwara, but accompanied by other plants which my informants did not know or did not want to bother gathering. One of the botanists from the Rondon Commission, Hoehne, cities six species of different, not completely identified plants, which were pointed out to them by a Pareci Indian as entering into the composition of their arrow poison. But this poison did not keep and could not be studied.

/220 cont./

278 171 [177] The Tamandé Ñambikwara, of the upper course of the Roosevelt River, assured me that curare had come to them from other Indians living farther to the north, in the region of the Gy Paraná /Gi-Paraná River/; it was not possible to make them specify what kind of Indians these were.

The Cabixiano /Cabishi?/ of the Rio Mequem, to the northeast of Ñambikwara territory, also use curare. According to a civilized Indian of this group encountered at the post of Baron de Melgaço, their product with a complex vegetable base is prepared secretly and only by a few old men; it is a hard curare in a jar. It is used for hunting, even of tapirs, and for war.

The Pareci, along with the Ñambikwara, represent the extreme southern point of the spread of curare, the use of which as one goes toward the Amazon becomes more and more frequent and its preparation surrounded with more mystery.

278 137 All the curares are not as simple as the Ñambikwara curare, but all appear to have as their principal base a species of Strychnos which varies according to the region. Certain Strychnos such as St. toxifera Benth., Str. lethalis Barb. Rod., and especially St. crevauxhiana Baill, are particularly toxic; others like St. pseudo-quina are very low in poisonous elements.

278 Besides the Strychnos, active elements of curare, of numerous other plants generally poisonous but with very diverse properties, and of animal substances such as venoms, often enter into the composition of this poison. Their addition answers different ends.

Sometimes these are resins or gums whose sole utility is to harden the product and to assure its preservation.

Sometimes they are toxic substances destined to reinforce or to complete the action of the Strychnos.

/221/ In other cases other substances without any actual effect but with magical properties are added to curare. Their nature is infinitely variable.

/221 cont./

●278 In many cases also the complexity of the curare seems to have no other end than to mask the real active elements and to assure the monopoly of its preparation by a few individuals.

We have thus led to divide curares into:

simple curares, with a base solely of Strychnos.

composite curares, in which diverse vegetable or animal elements are added to the Strychnos with the end: a) of hardening the product, b) of reinforcing its physiological action, c) with magical aims, and d) to conceal its real composition.

The Ñambikwara curare represents the most simple type.

Beyond its ethnographic aspect the knowledge of the exact composition of this curare interests physiologists; it will make it henceforth easy to prepare a very active curare with a constant action for research laboratories.

THEORY OF DEATH

761 [100] Death distinguishes between men on one hand, women
775 and children on the other. When they die, the former are transformed into jaguars who represent, consequently, so many reincarnated humans. The women and children, on the other hand, disappear with the wind and the storm and are not susceptible to any reappearance.

40. denõ dũrige uetnatũrina ẽdnadure lukuĩndige ndakuĩndige monãnkiadukuĩndige denõ dũrige monãure lĩttige amonotlĩttige tonodũrige uitẽndige (b1)
The woman and child who die do not change into beasts. The man who dies is changed into a jaguar, the woman who dies goes away with the tempest disappears with the storm.

262 Whence, among the Nambikwara, the only perfectly clear prohibition concerning food. Theoretically several exist, broken each time that the occasion is presented, such as those concerning the hawk, the worms from the bacaiuva nuts, and there may be added a probable repugnance concerning the meat of the veado (Cervus sp.). Chickens and dogs are never eaten, but their introduction is recent.
[224 On the other hand, the jaguar can be hunted and killed, and its re-
281] mains are highly regarded since the hide is used to make the fur
714 bonnets worn in the attire of war; but it is not eaten under any pretext:

41. [following preceding text] loukuĩndige inkõra uĩrige lotõtãirige ikuitãdige uĩrige (b1)
775 [the dead man] becomes a jaguar, another eats him, the jaguar carries him off, he is left to another in order to eat him.

This theory complements the information collected in the eastern group more than it differs from it. The jaguar in fact plays the same role as the atãsu, it also carries off the dying. But the central theory adds a complement. This is that the deceased is identified with the animal, who thus becomes a supernatural being. It was not possible to find out if the atãsu which one meets at night are considered to be the souls of reincarnated dead people. (1)

776 1. One recognizes in the man-eating jaguar gifted
171 with a supernatural nature a typically Tupi theme, although its present diffusion is much greater. See concerning this subject, Métraux, loc. cit., passim.

622 The command carries, moreover, a certain number of fixed offices. It is the chief who makes the poison for arrows; and he presides over ceremonies of initiation, of marriage or burial, concerning which we shall speak later. He organizes chants and dances, festivals both when they assume a ritual character, and when they have as a goal purely secular distraction. It is he who organizes 622 526 ball games. The ball game is widespread in western and northern Mato Grosso, for it is found from the Paressi to the tribes of the Lower Guaporé. Among the latter people we have been able to gather evidences of its sociological significance. It is perhaps the same among the Nambikwara; but, at least during the period of nomadic life, the ball game is practiced with a purely recreational goal in mind. The teams are built up haphazardly from those present and upon the spur of the moment, and the game takes place in a spirit of complete improvisation.

WAR AND TRADE

648 The two subjects should be treated simultaneously, commercial 609 exchanges usually representing potential wars peacefully re-[91] 439 solved, and the wars, the outcome of unhappy transactions. Among the numerous bands which cross through the bush during the dry season, it is necessary to distinguish those who are related by family ties, and who often represent the population of a winter village—or of a group of villages—which has "burst forth" in the pursuit of the nomadic life. Among themselves these bands entertain relationships which are normally pacific, although not necessarily so. On the contrary, bands which are strangers to one another, composed of members not related among themselves and whose geographic location is far distant, or who are even separated by differences of language, mistrust one another at the same time that they feel themselves necessary to one another. Only when they meet can they procure desirable articles which only one of them is capable of obtaining or of making. These articles seemed to us to belong essentially to three categories: first of all women, whom only victorious expeditions are permitted to carry off. Next seeds, notably bean seeds, and finally ceramics, or [283] even fragments of pottery used to make the weights of spindles. Group [84] a1 whose cultural level is clearly inferior (especially in its ignorance concerning pottery) to that of its western and southern neighbors, according to the word of its chief, had carried on several campaigns during the last few years with the goal of procuring these two last articles.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life.

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard.

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton.

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string.

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the *"Arawak"* type (pl. 37, *center, right*).

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour.

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark.

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood.

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A favorite dish is to crush in a mortar manioc cakes with boiled beans, broiled meat, ants, palm nuts, monkey and bird bones.

As an example of the variety of uses to which the Nambicuara can put a plant we can take the buritĭ palm: (1) They eat the pulp surrounding the scaly covered nut. (2) They use the fibers from the new growth to make twine. (3) They use the tough, flexible cortex of the frond stalk for making baskets. (4) They fell the buritĭ so that a certain variety of grub can collect and multiply in the starchy pith in the heart of the tree. The grubs or larvae they then eat uncooked. (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buritĭ palm has male associations, for only men can prepare its products. When a male child dies a piece of buritĭ fiber is left over his grave.

The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 18 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick loosens into small smouldering balls. These he places into a handful of dry buritĭ fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

The material equipment of the Eastern Nambicuara is extremely simple. Many items, such as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small grater and the few gourd vessels, small baskets, and twine, the woman carries

[p. 92(B)]

411 thickness in the middle. This bow is made from the honey-colored heartwood of a small piuva tree. After cutting a piece of the required length the bow maker splits it by using two or three axes. He then trims off the outer layer of wood with an ax, shapes it with a knife, and polishes it with lixeiro leaves. The inner side of the bow is flat or slightly concave, depending upon how the wood splits. Shoulders are made at each end to hold the bowstring. The bow is made from green wood, no attempt being made to season it. The siriva bow is the same shape and is made in the same way but [184] the black wood surrounding the center is used. The siriva bow is more common among the Western Nambicuara.

● [283] The bowstring (*kalunwinisu*) is made from tucum fiber and is about one-eighth of an inch in thickness. The cord is much longer than required and the extra length is wound around the bow for about 6 inches just above the hand hold. The cord is wound from left to right, the running end being brought back over the previous turn to form a cross on the inside of the bow. The string is always smeared with urucú (*dúse*). As the bowstring wears out it is not removed but new lengths of tucum fiber are woven into the extra length.

The basis of the Eastern Nambicuara arrow is the jointless shaft (*alukwirikatu*), which appears to be cane (*Gadua* sp.). Before being made into an arrow the cane shaft is heated over a fire to harden it. Into this cane shaft, which is roughly three-eighths of an inch in diameter, a piuva foreshaft (*ihdikatsutu*) is inserted for a distance of 4 or 5 inches, leaving about 20 inches protruding. The joint is wound with sipó vine for about [237] 6 inches. To feather the arrow, a 10-inch macaw feather (*akinéntsu*) is split and the halves are laid parallel to one another on opposite sides of the [284] butt end of the shaft. The feathers are lashed to the shaft with cotton twine, the lashings being about an inch apart. Although the feathers are laid straight along the shaft, they assume a propellerlike pitch which gives the arrow its revolving [237] motion when in flight. The lashings are covered with beeswax. The butt has a V-notch to hold [284] the bowstring, which is again tightly wound with waxed cotton twine. By attaching various parts to the end of the foreshaft, four different kinds of arrows about 5 feet long are made.

[p. 93(2)]

411 (1) The *hányesu*, an arrow which is used for [223 224] shooting monkeys and large birds, is made by lashing an inch-long slender barb of siriva palm or piuva about an inch back from the sharpened point of the foreshaft.

[227] (2) The *saldítsu*, or fish arrow, is made by lashing four slender points of wood about 2 inches long to the end of the foreshaft. This arrow need not be feathered. Today wire is sometimes substituted for the wooden points.

[223] (3) The *dúnkisu*, or blunt bird arrow, used for shooting small birds, has a separate piuva foreshaft, the end of which forms a rounded flat surface about an inch in diameter.

[224] (4) The *hóptisu*, or big game arrow, has a broad split bamboo point about 12 inches in length which is lashed to the foreshaft. As the bamboo point is slightly grooved along the center, the foreshaft lies along the groove permitting it to be lashed firmly to the tapered sides of the point. Formerly curare poison was smeared along the groove. This was also the arrow used in war.

Sometimes a bamboo point is serrated on one or both sides. In former times, this arrowhead was poisoned with curare. It was attached loosely to the shaft so that when it struck an animal it became detached from the shaft. This arrow was used against big game like the jaguar, tapir, deer, and against human enemies.

The bow is held in a vertical position when shooting; the arrow is held with the thumb and forefinger while the middle and ring finger pull the bowstring, with the arrow resting against the hand side of the bow.

● 283 Cordage is made from the fibers of the tucum and buriti palms and from cotton. The tucum palm (*Astrocaryum tucuma*), *hatdtsu*, provides not [306] only fiber but the hard shell of the nut is used for making the black, round, flat necklace washers, [252] and the thorns from the trunk are used as spikes in the manioc grater. Tucum twine which is a little stronger than buriti twine is used for bowstrings, for stringing beads, and for many other purposes. When a man needs tucum twine he sends his wife to gather the palm leaves. As the young trees grow in clumps, it is a simple matter for the woman to cut off a number of fronds. The woman then takes a long slender leaf, bends it double in the middle so that the woody fiber breaks, then doubles it back and pulls downward

283 on one half while holding the other, thus stripping the fine fiber from the body of the leaf. She then turns the leaf over and strips the other half. Later she picks off whatever bits of green skin that adheres to the fibers and twirls one end between her fingers to keep the fibers together. From each leaf, therefore, she gets a pale green whip of fiber which forms the raw material for cordage making. A number of these whips are wrapped in embira, the bundle being known as *dáidjusu*, and stored away for future use.

When a man wishes to make cordage he begins to add these whips to existing bits of twine or cord. I never saw a man making a completely new cord. The end of an old piece of cordage is unraveled and three whips are joined to it at intervals of several inches and rolled together on the thigh, the motion being toward the body. This stroke rolls up the fibers into three tight strands. On the downward stroke the three separate strands are "laid up" or rolled together to form the cord. Three new whips are added and the process is repeated until the cord is of the desired length. If the man wishes to make finer cord he separates each whip into a number of parts.

The making of cordage from buriti (*Mauritia vinifera*), *yélasu*, as has been mentioned, is man's work. The man finds a young buriti palm and from the top of it cuts down the shoot which encloses the three leafstalks. This growing part is a tapered rod about 5 feet long and triangular in shape. When twisted this rod cracks open revealing countless fine strands covered with a green skin, each strand having a hard embryonic leaf stem running through the center. First the man peels off the green outer skin and then pulls out the embryonic leaf stem. What he has left is a hank of lemon-colored, soft, grasslike ribbons the length of the original rod and about one-half of an inch in width. These ribbons he coils and places in a pot and boils for about 20 minutes so that the starchy material is loosened. In former times the hank was placed in the hot sand under the fire and sprinkled with water. When the coil is cool enough to handle the man opens it out and begins to rub it between his hands just as does a woman washing a strip of cloth, periodically dipping it into the warm water. As he rubs, the hank gets quite sticky as the starchy material

283 breaks down. After one-half hour the starchy material is washed out and the ribbons begin to separate into fine strands of fiber. The hank is then shaken out and hung up to dry. When of good quality, that is, when the rod is of the right age, the fibers dry out a pale cream color. While the man is occupied at this task the girls make temporary necklaces from the green outer skin and the boys use the thin central stems as arrows for their small bows. These dried-out hanks are [301] a favorite decoration of the Nambicuara when painted with horizontal bands of urucú. They can then be suspended from the neck and allowed to hang down the back, or pieces are attached to the arm bands, leg bands, and in front to the belt.

Cotton twine is used for making arrows, stringing beads, weaving arm bands and the narrow shoulder straps which women use for carrying young children. From the cotton bush (*kúndzu*) the woman picks the bolls (*kúnkisu*) to make cotton twine (*kúnálisu*). As the making of buriti twine is a man's task, so the making of cotton twine is purely a woman's task. After picking the seeds from the bolls she spreads the cotton into flat disks and then into circles. Next she breaks the circles and joins them to form a long rope about an inch in diameter. This rope she winds around her arm, twists the end of it with her fingers, and fastens it to the top of a spindle (*wanikisu*). With a twirl of her fingers she sets it spinning and lets it drop, plucking out the cotton as it is spun. Later she unties the string and fastens it near the whorl and then by spinning the spindle on the ground the twine is wrapped around it. This process is repeated until the cotton rope is used up.

286 The men do the weaving on a true but very makeshift loom. Two forked sticks, roughly a yard long, are thrust into the ground about 2 feet apart and at an angle. One cross bar rests in the forks while another is fastened on near the ground. The warp is wound around these cross bars. The heddle, shuttle, and sword are used in [177] weaving the narrow material. It seems very likely that this type of loom was taken over from the Arawakan Paressí.

The bast strap or band (*sa'am*) is made from embira and is used for pressing manioc pulp, for carrying children or baskets, and, when cut into strips, is used for tying up bundles.

[p. 95 (A)]

342 provided with a fairly large doorway; it could easily hold some twenty people. The other had the shape of a triangular prism, with one of its [lateral] faces to the ground. It was more carefully constructed, and measured nine meters in length, three and a half in width and two and a half in height. One of its ends was closed; on the side, hidden by the leaves which hung from the roof, there was a small door. The other end was fully open. The hut was oriented in an east-west direction, the closed end facing the east. Thus in the afternoon the rays of the sun entered the house for a few hours.

Two forked stakes, one at each end of the building, supported the ridgepole. [222] Several beams designed to hold the huge covering leaves of the babassu palm ran from the ridgepole to the ground.

The palms which were laid on one side of the roof were folded at the top over the ridgepole onto the other side; in order to hold
[283 824] them in this position, two rods ran the length of the house, tied to the inner beams with knots of embira (1) cord.

1. A bast fiber yielded by one of the embira trees. (Ed.)

Tagnani and Tawite villages also consist of two huts. Each, with its entrance oriented in an east-west direction, is evenly circular at ground level and conical in shape. From the apex of the cone a pole rises a few spans above the roof; it is always forked at the tip, as shown in the photograph. The doorways are set on opposite sides of the building, facing each other.

We still do not know how the Nambicuara trace the circle which delimits the hut; it must be a freehand line, for that is how they draw this figure on their gourds. In the middle of the house they set up four stakes forked at the tip and a centrl support. [Fig. 16]

The forked stakes form an overhead rectangle of wood, from which flexible poles run down into the ground along the circle which delimits the house. These poles are secured and connected by horizontal rods which complete the framework of the hut. The covering consists of bacaba palm leaves arranged in layers. As seen from within the hut, the first layer consists of plaited leaflets fastened to the [223] woodwork. [Plate p. 226]

372 They make fire with mastic resin sticks, the tips of which are wrapped in straw to protect them from the rain.

[Fig. 63]

241 415 Their plots are worked with pointed sticks. The seeds of urucu, gourd plants (Lagenaria) and cotton are kept in leaf containers.

278 824 Medicinal fruit (Solanum mammosum) is also saved, as well as roots, leaves, etc.

[Fig. 31]

386 The collection contains two samples of dyes: a paste of urucu and fat, sweetly scented, which the women use to paint their body after the bath (huduhukaidi); and a variety of red ocher. [279]

248 Cotton (1) is represented by seeds (rim de boi variety) in leaf

[171]

1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Andes and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[283 286] containers; cotton thread (kondzú) from a spindle (gdaretatú); skeins [255] of spun cotton; cotton fabric (sareguêzê--strap used to carry children). The spindle is made of a palm splinter imbedded in a round [283] potsherd.

[Fig. 64]

415 824 Kateçú are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

783

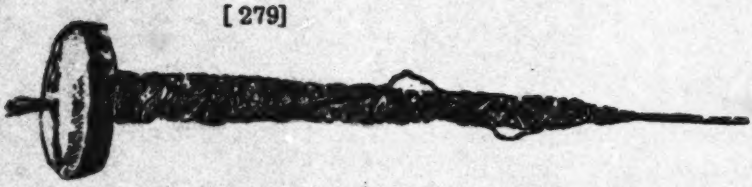

Fig. 84. Gdaretatú--Serra do Norte spindle.

411 thickness in the middle. This bow is made from the honey-colored heartwood of a small piuva tree. After cutting a piece of the required length the bow maker splits it by using two or three axes. He then trims off the outer layer of wood with an ax, shapes it with a knife, and polishes it with lixeiro leaves. The inner side of the bow is flat or slightly concave, depending upon how the wood splits. Shoulders are made at each end to hold the bowstring. The bow is made from green wood, no attempt being made to season it. The siriva bow is the same shape and is made in the same way but the black wood surrounding the center is used. [284] The siriva bow is more common among the Western Nambicuara.

[283] The bowstring (*halunwíniru*) is made from tucum fiber and is about one-eighth of an inch in thickness. The cord is much longer than required and the extra length is wound around the bow for about 6 inches just above the hand hold. The cord is wound from left to right, the running end being brought back over the previous turn to form a cross on the inside of the bow. The string is always smeared with urucú (*dúse*). As the bowstring wears out it is not removed but new lengths of tucum fiber are woven into the extra length.

The basis of the Eastern Nambicuara arrow is the jointless shaft (*alukwírikatu*), which appears to be cane (*Gadua* sp.). Before being made into an arrow the cane shaft is heated over a fire to harden it. Into this cane shaft, which is roughly three-eighths of an inch in diameter, a piuva foreshaft (*ilɔ́ikatsutu*) is inserted for a distance of 4 or 5 inches, leaving about 20 inches protruding. The joint is wound with sipó vine for about [237] 6 inches. To feather the arrow, a 10-inch macaw feather (*akinéntsu*) is split and the halves are laid parallel to one another on opposite sides of the butt end of the shaft. [284] The feathers are lashed to the shaft with cotton twine, the lashings being about an inch apart. Although the feathers are laid straight along the shaft, they assume a propellerlike pitch which gives the arrow its revolving [237] motion when in flight. The lashings are covered with beeswax. The butt has a V-notch to hold the bowstring, which is again tightly wound with [284] waxed cotton twine. By attaching various parts to the end of the foreshaft, four different kinds of arrows about 5 feet long are made.

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life.

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard.

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton.

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string.

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Arawak*" type (pl. 37, *center, right*).

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour.

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark.

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood.

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the

Juina River Indians

Juina River Indian

301 [280] [One necklace not mentioned earlier] is made with the [824] seeds of a Cyperacea (tanieikerê) which the Suya of the Xingu River also use. . . . . .

[825 237] Oradaikruzê is a beautiful bracelet made with the tail rings of the giant armadillo (Dasypus gigas). It looks like ivory. Other bracelets are made from the nuts of the babassu and pindova (Orbignya speciosa) palms. [824]

[Fig. 65]

Bands for the upper arm are made of cotton and fastened similarly to those of the Paressi.

291 The ialaçu is a simple fiber cape, widely used, which fastens to the neck and hangs down the back. There is also a black feather cape in the collection.

301 [281] The stem of the unetizũ (nose plume) is made of thin bamboo or the stalk of a tough grass (Andropogon).

. . . . The helmets of puma or jaguar hide are used in that region only by the Nambicuara and by the Cayabi of the Paratininga.

[Fig. 66]

285 Max Schmidt broadly classified Brazilian Indian plaiting into Palmblattflechterei (palm-leaf plaiting) and Doppelfadengeflechte (double-strand plaiting). But he also admitted the existence of a third type, where two elements running in different directions are crossed by a third. This type occurs frequently on the Xingu River . . . and is found in Nambicuara baskets (aticũ).

[282: page of figures]

[283] As plaiting material the Nambicuara use titara liana and sometimes bamboo.

[293] . . . . Nambicuara fans, made with bacaba leaves, . . . are of pentagonal shape . . . .

534 A kind of nose flute made of gourd discs (hait-teataçũ) seems [171] to have been borrowed from the Paressi.

[Fig. 67]

The double flutes were borrowed from the Tapajoz tribes (Mundurucu, Maue, etc.). [See fig. . . . (70, p.]

[Fig. 70]

177 Their plaiting follows patterns clearly characteristic of the
[285] Xingu (Trumai and Nahuqua) and gives proof of contact with those backward tribes which the rudimentary culture of the Nambicuara had already implied.

[253] The quadrangular barbecue, which differs from the usual pattern, is used only by the more advanced groups (Tagnani, etc.); it recalls the barbecue of the Javahe as depicted by Fritz Krause. (1)

1. F. Krause, In Den Wildnissen Brasiliens [In the Brazilian Wilderness] (Leipzig, 1911).

[301] The straw ornaments of the Nambicuara are quite similar to
197 those of the Suya. But linguistic affinities are even more indicative of contact between the two groups. No other people speaks a dialect [310] so similar to that of the Nambicuara in terms of word morphology, although the two languages are otherwise quite different.

171 It is interesting that a spontaneous affinity should arise be-
177 tween two remote and equally primitive tribes, the Guayaki of Paraguay and the Nambicuara of the Serra do Norte, from their common use of the jaguar hide helmet.

However, I am inclined to believe that the latter copied it from their neighbors, the Cayabi of the Parataninga River, who use helmets of the same material.

174 Unfamiliarity with the banana tree and with the pipe (an ob-
171 ject frequently encountered in North American mounds and Brazilian sambaquis) indicates how long the Nambicuara have been established in their mountain range.

Recognition of the Ge-Botocudo group as one of the oldest representatives of aboriginal South American populations is no longer a matter of dispute. . . . .

171 [311] There is no doubt, in my opinion, that the [Brazilian] linguistic groupings correspond to ascending stages of civilication [312]. . . . . The Serra do Norte is inhabited by a people of Ge culture evolving toward the Nu-Arawakan culture, of which they have barely reached the initial stages.

789 Poison is thus nãnde par excellence, although the latter can exist in other forms, at the same time less precise and more complex. We attach extreme importance to the fact that a rigorously utilitarian technique of the manufacture of poisons is found associated with a theory which accounts for their effectiveness through the intermediary of metaphysical concepts. The presence among the Nambikwara of a curare reduced to a basic product, and whose preparation excludes all ritual, associated with the very low cultural level of these Indians, poses in a particularly impressive way the question of finding out if these characteristics which are very primitive are so by origin or constitute the residue of an impoverished culture. Now, it is much more reasonable to interpret the apparent contradiction of theory [121 174] and practice in matters of poison by the loss of complex rituals which farther north are attached to the making of curare, than it would be to explain how a theory of supernatural character could have been built on the bases of treatment which has remained purely experimental, of the root of the strychnos.

Besides the notion of nãnde we should examine another which is the object of a particularly advanced elaboration among the eastern groups, that of the atãsu (al). Atãsu signifies animal, but the use of the term by the Indians is complex. First of all it is the animal taken in a generic sense, in opposition to the inanimate. They present me with a honey cake and, pointing out the body of a bee which is still in it, I ask what it is. They do not answer, "it is a bee" but: atãsu, "it is the animal." Atãsu also means real animals, but ones without their own names in the vocabulary, and which are of particularly fearful character. Thus oxen are called by this name by the Nambikwara who never saw any [99] before the years 1910-1915, and who entertain a great fear of them. Then we find the same term to designate the stars (eastern groups), and the same name is given to the ticktock of the clock, both conceived of as realities animated by mysterious characteristics. Finally, atãsu is a special animal of supernatural essence, which is seen appearing in two cases—at night, on the road, in certain places and during certain periods, and upon the approach of death. In the first case, one risks being attacked and killed by the atãsu if one does not defend oneself 789 411 in the appropriate manner. This means is found in the throwing stick [épieu] (distinct from the digging stick), thrown in a prescribed manner. The throwing stick, a large piece of wood of flattened form [286 531] and pointed at the end is furnished with a handle usually decorated with black and white bark weaving (javelin: hĩdosu [al], kẽũẽre

SP17 Nambicuara SP17

ties down to their smallest details. There is, undoubtedly, a function in chieftainship. This can, however, be reached only through analysis as the underlying principle of the institution. In other words, the differing structure of the digestive organs in man, ox, fish and clam do not point toward different functions of the digestive system. The function is always and everywhere the same, and can be better studied, and more fully understood where it exists under a simple form—for instance, in a mollusc. Similarly, and as Professor Lowie once wrote, if anthropology is to be considered as a scientific study, its subject matter cannot be individual cultures, but culture taken as a whole; the rôle of individual cultures being to offer, according to their own characteristics, special angles from which the basic functions of culture, although universal in application, can be more easily reached.

This will perhaps help us to eliminate preliminary questions which otherwise could have proved very difficult. Anthropologists in South America and elsewhere have been eagerly debating the question of whether these South American tribes—nomadic, relying mostly on collecting and gathering, with little or no agriculture, little or no pottery, and, in some cases, with no dwelling other than crude shelters—should be considered as truly primitive and as having preserved their exceptionally low cultural level through tarriance, or whether they did not previously possess a higher type of social and material organization and have regressed to a pseudo-archaism under unfavorable circumstances. The Nambikuara are one of those tribes which, along with the Siriono, on the other side of the Guaporé valley, the Cayapo, Bororo, Karaja of central Brazil, the so-called *Gé* of Central and Eastern Brazil, and some others, together form a kernel of primitiveness surrounded, in the West, by the higher tribes of the upper Amazon, the Bolivian plain and the Chaco, and from the Oronoco's to the La Plata's estuaries, by a coastal strip inhabited mostly by the Ara[illegible]k, Carib and Tupi-Guarani linguistic families. An independent linguistic stock divided into several dialects, the Nambikuara seem to display one of the more backward cultures in South America. At least, some of their bands do not build huts and are wholly ignorant of pottery and, even among the others, these two arts are exceedingly poor. There is no weaving, except for the narrow arm and leg bands which are made of cotton; no dress whatsoever, either for the men or for the women; no sleeping contrivances, such as hammocks or platforms; the natives being used to sleeping on the bare ground without the protection of blankets, mats or hides.

283 breaks down. After one-half hour the starchy material is washed out and the ribbons begin to separate into fine strands of fiber. The hank is then shaken out and hung up to dry. When of good quality, that is, when the rod is of the right age, the fibers dry out a pale cream color. While the man is occupied at this task the girls make temporary necklaces from the green outer skin and the boys use the thin central stems as arrows for their small bows. These dried-out hanks are [301] a favorite decoration of the Nambicuara when painted with horizontal bands of urucú. They can then be suspended from the neck and allowed to hang down the back, or pieces are attached to the arm bands, leg bands, and in front to the belt.

Cotton twine is used for making arrows, stringing beads, weaving arm bands and the narrow shoulder straps which women use for carrying young children. From the cotton bush (*kúndsu*) the woman picks the bolls (*kúnkisu*) to make cotton twine (*kúnálisu*). As the making of buriti twine is a man's task, so the making of cotton twine is purely a woman's task. After picking the seeds from the bolls she spreads the cotton into flat disks and then into circles. Next she breaks the circles and joins them to form a long rope about an inch in diameter. This rope she winds around her arm, twists the end of it with her fingers, and fastens it to the top of a spindle (*wonikisu*). With a twirl of her fingers she sets it spinning and lets it drop, plucking out the cotton as it is spun. Later she unties the string and fastens it near the whorl and then by spinning the spindle on the ground the twine is wrapped around it. This process is repeated until the cotton rope is used up.

286 The men do the weaving on a true but very makeshift loom. Two forked sticks, roughly a yard long, are thrust into the ground about 2 feet apart and at an angle. One cross bar rests in the forks while another is fastened on near the ground. The warp is wound around these cross bars. The heddle, shuttle, and sword are used in [177] weaving the narrow material. It seems very likely that this type of loom was taken over from the Arawakan Paressí.

The bast strap or band (*sa'am*) is made from embira and is used for pressing manioc pulp, for carrying children or baskets, and, when cut into strips, is used for tying up bundles.

[17]

1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Andes and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[283 236] containers; cotton thread (kondzú) from a spindle (gdaretatú); skeins [155] of spun cotton; cotton fabric (sareguêzê--strap used to carry children).

[283] The spindle is made of a palm splinter imbedded in a round potsherd.

[Fig. 64]

415 824 Kaneçú are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

[See fig. ... (28) p. 308.]

[133] dividing line of waters which separates the basin of the Paraguay, a tributary of the La Plata River, and the sources of the Arinos River, itself a tributary of the Amazon.

In its general aspect, the region is a sort of vast undulating plateau, falling slowly in the direction of the basin of the Amazon, with the highest points in the center and in the south (about 800 meters) and the lowest (about 350 meters) toward the north and west. Nevertheless, the traveler leaving from the south is greeted by an impressive spectacle when, after having traveled through 1,200 kilometers of high desolate land, he reaches the northwest border of the plateau, compared to the lowlands the difference in altitude is small, 100 meters at the most, but the rise is abrupt. Behind him, he leaves an interminable and sterile brush, while immediately at his feet begins, with the valley of the Gi-Parana, the no less interminable Amazon forest. This remarkable geographic frontier is also the western limit of Nambikwara territories.

Farther to the center and to the north, the aspect is different; running waters have worn ditches across the plateau which become larger in the direction of the Amazon basin. These depressions bring about differences in altitude up to 150 meters. One notices them especially in the region which extends from the Roosevelt River to the Dore de Outubro River, and they give this region a falsely mountainous aspect from which the fallacious expression "Serra do Norte" probably originates.

[134] [132] Geological constitution conspires with climatic conditions to [5] give the plateau its desolate physiognomy. The sand, product of the decomposition of the sandstone, provides a sterile soil, and the irregular distribution of rain explains the prairie-like aspect, so characteristic of the whole region. Except for a little rain—very rare—which falls sometimes in July or August, the "chuvas de caju," one might say that the period from April to September is completely arid. On the contrary, precipitation is violent and almost daily from October to March. There are storms when the rain lasts sometimes one, two or even three consecutive days. During the rainy season the temperature rises 42 to 44 degrees[1] during the day, cooler at night, with a sudden and brief shower at dawn. But abrupt variations of temperature rather characterize the dry season, probably because of intense nocturnal radiation. It is not rare, at this season, to go from a daytime maximum of 40 degrees to a nocturnal minimum of 8 or 10 degrees. The Indians, who live completely nude, sleep on the ground, and know nothing of the use of coverings either of cloth or fur, suffer cruelly from this circumstance.

[291] [313]

[1] [i.e. degrees Centigrade.— Rivalpt]

[2] In other publications (2) we have brought up the question of

knowing if the type of life of the Nambikwara, apparently very primitive, does or does not constitute the authentic vestige of ancient conditions. Considered in the present, their level of culture is certainly very low. They live naked, especially the women, who only wear a thin string of buriti beads around the waist, some earrings, necklaces worn around the neck or looped over the shoulder, [14] bracelets made from the tail of the large armadillo, and, sometimes, some narrow bands of cotton woven by their husbands, or some buriti straw, tightly bound around the biceps, and wooden pins. Besides the same ornaments, the men sometimes put on a sort of straw pompom, fastened to the waist above the sex organs, and smaller ones, attached to cotton bracelets; on the other hand, they do not wear shell bracelets. The complete ignorance of the hammock and the Nambikwara [5] custom of sleeping on the ground (or, more rarely, on long strips of the bark of the palm tree paxiuba) has intrigued ethnologists for a long time. This sentiment is shared by neighboring tribes, and the [10] Paresi, mentioning this peculiarity, call the Nambikwara Uaihoakorê, "those who sleep on the ground."

[2] The Nambikwara year must be divided into two distinct periods. During the rainy season (from October to March), each group settles on some small elevation rising above the course of some stream. The Indians then construct crude huts with curious variations in form and materials. They burn clearings in the approaches to the forests which [2] occupy the humid valley floor, and there they plant and cultivate [4] gardens principally with the starch-yielding plants of the manihot genus (sweet and bitter) and tobacco, sometimes some peas, cotton, peanuts, and calabash (Lagenaria sp.). They grate the yucca (manioc) on planks covered with the sharp bark of the palm tree, they press it with the aid of a piece of twisted bark. The garden produce furnishes food resources sufficient for part of the sedentary period, and even of use later: the Nambikwara preserve the yucca by burying the residue of the grated pulp in the ground.

[2] At the arrival of the dry season, they abandon the village, or rather the site of temporary residence, and each group "breaks up," if one can say that, into several nomadic bands. For about seven

648 37. tamaĩn ãme munẽtjere munẽtjenẽtiore ajanĩ (bi)
609 The Tamandé sing well; as for me, I cannot sing well any more!
201 In one case which we witnessed, the general tone was quickly raised with the excitement of the meeting, and the night had not yet ended before the speeches mixed with chants made an extraordinary uproar, whose significance escaped us completely. Menacing gestures were outlined, sometimes even some scuffles were produced while other Indians intervened as mediators. All of these hostile manifestations are stylized, and end as gestures calling to mind sexual parts of the body. On the part of the aggressor, menace, or the gesture of Nambikwara hostility, consists of seizing the penis with two hands and directing it towards the adversary while inflating the stomach and thrusting it out, and of flexing the knees (the men also make this gesture in fun toward children when they wish to get rid of them). The second stage consists of an act of aggression toward the person
[291] of the adversary, with a view to tearing off the piece of buriti straw attached to the front of the waist, above the sex organs. The latter "are hidden by the straw" and "they fight to tear away the straw." This action is entirely symbolic, for the covering of the male sex organs is made of such fragile material and is reduced so small in size (and often non-existent) that it is out of the question for it to assure protection of or be any kind of covering for the organs. Another form of aggression consists of seizing the adversary's bow and arrows and laying them aside. In all of these actions the attitude of the Indians is extremely tense as if they were (and really, they are) in a state of violent and contained anger. Doubtless these brawls degenerate at times into generalized conflicts, but in our case, they calmed down at dawn. Always [93] in the same state of apparent irritation, and with gestures devoid of friendship, the adversaries looked at one another to inspect one another, rapidly
[301] feeling the earrings, the cotton bracelets, the little feather ornaments, while murmuring rapid words:

38. tõhẽ tõhẽ kãhẽ kãhẽ mununiti (bi)
Give, give, see, see, it is pretty!

648 This "inspection of reconciliation" marks the normal conclusion
439 of the conflict. And actually it is this which introduces the new aspect which the relationships between the two groups are going to take—commercial exchanges. However summary the material culture of the Nambikwara may be, the products of the industry of the different groups are highly prized by their neighbors. The eastern groups need pottery and seeds; the northern and central groups consider

342 [361] shelter and lights its own fire in the opening. During the rainy season, villages consisting of one or more beehive huts are built on slight hillocks above the course of a secondary stream. Some of the *Eastern Nambicuara* build only shelters, although larger and stronger than the ones described. The beehive hut is very light, each about 10 to 20 feet (3 to 6 m.) in diameter. The frame consists of several long, supple poles, bent so that both ends can be stuck into the ground and tied together at the top, where they cross. Circular branches running horizontally are tied to the poles at different levels. The *Central* and *Western Nambicuara* have a more elaborate hut (pl. 37, *top*) whose perimeter is about 50 feet (15 m.). It has a central post from the base of which several forked poles run obliquely to support the bent poles of the external frame. All types of huts are thatched with horizontal layers of palm leaves, those of *Central* and *Western Nambicuara* exactly like the houses of their southern neighbors, the *Kepikiriwat*.

A gabled house without walls was also observed by Roquette-Pinto, who recorded other kinds of temporary huts. Some were built by sticking two branches into the ground, bending them over and attaching them to a horizontal pole tied to two perpendicular posts and covering them with bunches of grass.

352 513 The *Nambicuara*, although all their neighbors use hammocks, sleep on bare ground or on flat pieces of bark from the paxiuba palm. Because of this custom, the *Paressí* nicknamed them *Uaikoakôre*, "Those Who Sleep on the Ground."

CLOTHING AND ADORNMENT

[291] 301 Both sexes are naked, except that men sometimes tie a small tuft of buruty straw to their belt to cover the sex organs. Both men and women wear a thin, cotton-thread belt strung with white or black beads cut from river mollusk shells or from tucumã palm nuts. Such beads, with larger triangular pieces of mollusk shells, are also used for necklaces, earrings, bracelets, and other ornaments. Men wear grass or reed pins through their upper and lower lips; and, through their nasal septum, a larger pin made of a jacu (*Penelope*) feather mounted on a stalk covered with plaited cotton thread and porcupine quills and trimmed with a red toucan feather ring. Both sexes wear armlets and anklets of woven cotton, burity straw, feathers, parts of dried birds, fur, or mollusk or crawfish shells. Women wear one or more bracelets cut from the tail of the great armadillo and double bandoleers of plaited cotton dyed with urucú and decorated with porcupine quills. Hair ornaments are confined to men: circlets of plaited straw, of straw and and toucan feathers, or of fur with [714] feather pendants. War dress consists of a jaguar-skin bonnet (pl. 36, *top, left*) with a long, plaited buriti-straw tail painted with red stripes And dots hanging down from the nape of the neck.

ties down to their smallest details. There is, undoubtedly, a function in chieftainship. This can, however, be reached only through analysis as the underlying principle of the institution. In other words, the differing structure of the digestive organs in man, ox, fish and clam do not point toward different functions of the digestive system. The function is always and everywhere the same, and can be better studied, and more fully understood where it exists under a simple form—for instance, in a mollusc. Similarly, and as Professor Lowie once wrote, if anthropology is to be considered as a scientific study, its subject matter cannot be individual cultures, but culture taken as a whole; the rôle of individual cultures being to offer, according to their own characteristics, special angles from which the basic functions of culture, although universal in application, can be more easily reached.

This will perhaps help us to eliminate preliminary questions which otherwise could have proved very difficult. Anthropologists in South America and elsewhere have been eagerly debating the question of whether these South American tribes—nomadic, relying mostly on collecting and gathering, with little or no agriculture, little or no pottery, and, in some cases, with no dwelling other than crude shelters—should be considered as truly primitive and as having preserved their exceptionally low cultural level through tarriance, or whether they did not previously possess a higher type of social and material organization and have regressed to a pseudo-archaism under unfavorable circumstances. The Nambikuara are one of those tribes which, along with the Siriono, on the other side of the Guaporé valley, the Cayapo, Bororo, Karaja of central Brazil, the so-called *Gé* of Central and Eastern Brazil, and some others, together form a kernel of primitiveness surrounded, in the West, by the higher tribes of the upper Amazon, the Bolivian plain and the Chaco, and from the Oronoco's to the La Plata's estuaries, by a coastal strip inhabited mostly by the Arawak, Carib and Tupi-Guarani linguistic families. An independent linguistic stock divided into several dialects, the Nambikuara seem to display one of the more backward cultures in South America. At least, some of their bands do not build huts and are wholly ignorant of pottery and, even among the others, these two arts are exceedingly poor. There is no weaving, except for the narrow arm and leg bands which are made of cotton; no dress whatsoever, either for the men or for the women; no sleeping contrivances, such as hammocks or platforms; the natives being used to sleeping on the bare ground without the protection of blankets, mats or hides.

sionaries had not yet learned enough Iranxe to make working with informants possible.

As all of the following information, unless otherwise specified, relates to the Wakítisu band, a short description of this band is in order. Today the band consists of 18 individuals, of which Julio is the chief. About 5 years ago, before a measles epidemic decimated it, the band was roughly twice the size it is today. Julio is a man of middle age, has three wives and two children, and probably holds his leadership by being the strongest and ablest man in the band. Except for one of Julio's wives and her daughter who are Elótasu, the members of the band are Wakítisu and related to one another. Julio took the Elótasu woman from the Elótasu band by killing her husband. He claims he did this because the Elótasu chief stole one of his wives some years ago. He claims he is going to steal another wife, for every chief is supposed to have four. Only three other men, Martin, Marciano, and Joaquin, are married, each having one wife. The remaining four are either widowers or as yet unmarried.

Of all the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were the most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covered with some kind of scaly skin disease from head to foot, and another was deaf and dumb. The women and children, however, appeared to be healthy. Owing to the fact that they use no hammocks but sleep on the ground, they are always covered with dirt. On cold nights they remove the fires and sleep in the warm ashes. The Wakítisu wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat, makes proximity to them rather distasteful. They also appear to be heavily infected with internal parasites, for their stomaches are distended and they are continually passing wind. On several occasions when a number of them had crowded into the small room we used for working we had to cease work in order to air the room.

In their manners the Nambicuara also contrast sharply with the other tribes I visited. The

291 Around the waist both men and women wear a buriti cord; if possible, this string is strung with glass store beads. In addition, men sometimes suspend a lenth of buriti fiber from the front of the belt.

302 Men paint their faces with urucú, drawing a band from each side of the forehead down to the chin, another band across the eyes and bridge of the nose, and then a band from under each eye across the cheeks. On the body they draw two stripes, starting from the abdomen up to the nipples and then over to each shoulder. The arms and legs are dotted with red or black spots. The hair is seldom smeared with urucú.

SOCIAL ORGANIZATION

(See chart 13)

619 621 The names of the Eastern Nambicuara bands appear to be derived from characteristics peculiar to the band territory. The Waklítisu are cayman people for there are many caymans (*waklisu*) in their territory. The Elótasu are open plains people, for they live on the open plain (*lolu*) of the upper Camararé River. The Kitánhlu get their name from a small fruit called *tanlu*. The Chiwátisu are bee people from the word *wasiru*, bee. The Hégndisu are buriti fruit (*héeru*) people. Although these bands are not politically united under a single chief, and sometimes even resort to open conflict, they consider themselves a single people, or as Julio phrased it, "We can speak with one another and we came from the same hole in the stone mountain."

619 773 The origin myth of the Eastern Nambicuara, as it is told among the Waklítisu band, can be summarized as follows:

Before the Nambicuara came there were only animals, birds, plants, and beings who could change from animal and bird to human form. At that time the Nambicuara were inside a stone mountain called *pakatadurukatu*, which is situated north of the telegraph line near Campos Novos (roughly in the center of the territory now occupied by the Eastern Nambicuara). One day the monkeys heard people speaking inside the mountain and went to tell *okikidilisu* who changed himself into a black and white woodpecker and flew with all his strength against the mountain. When the mountain broke some were killed and some injured but many came out alive. The ghosts of the dead people remained around the mountain where they still are and where all Nambicuara go after they die. The injured people *okikidilisu* sent into the bush, but the people who were sound of body he put into good clean places and gave them the pitva bow and taught them how

261 which they covered themselves, squatting in a circle beneath the leaves and singing all the while. After a long time they rose, and with the branches still tied to their backs they started dancing around their catch, which was later carved.

115 Unhappily, Gouveia was of an amazing inadequacy. He had lived among them, a captive, for six months; he had actually married an Indian woman, who had tried her best to teach him the language of her forefathers. Yet in the end he fled, bringing back only the vaguest sort of information such as the above, which nevertheless I have deemed proper to record here.

276 Of the stimulants customarily used by primitive peoples, tobacco is the most important [among the Nambicuara] aside from those alcoholic beverages which have already been mentioned.

I have stated earlier that they dry the leaves between two pieces of wood which they stick into the house thatch; when they wish to smoke, they take a leaf and crumble it between their fingers, rolling up the dust in another leaf plucked from a tree which the Cocozu call enandrê.

[238] They also keep tobacco by reducing the leaves to dust which they store in special gourds.

[Fig. 28]

[[178]] Prior to the arrival of the Rondon Commission, the pipe was unknown among the people of the Serra do Norte. Even today they do not like it and prefer their cigarettes, which are small and quite unlike the huge rolls of some Amazon tribes. [Fig. 30]

Their tobacco (Nicotiana tabacum) is mild and pleasantly scented. On journeys they always carry gourds filled with tobacco dust, or sticks with tobacco leaves; if they feel like smoking somewhere along the way, they stop and form a circle. They proceed as if they were about to have a meal and kindle a small fire. When the cigarettes are finished they continue on their way.

They are extremely fond of our roll tobacco, especially when made into cigarettes with pieces of newspaper...

291 The Indians of the Serra do Norte go naked. Both men and
104 women wear a straw cord around the hips. The Cocozu wear bands of embira around the wrists and upper arms, below the knees and

291 around the ankles. The Tagnani and Tawite wear similar bands on
184 their upper and lower limbs; theirs, however, are made of cotton, which is used occasionally by the Cocozu to manufacture articles of this sort. [Plates p. 242.] Among the Tagnani and Tawite [239], men often cover their sexual organs with the ends of the straw cord that encloses their hips. But this is not the rule. The Uaintaçu rarely wear any of those bands; and among all groups, a few of the Indians always go completely naked.

[Fig. 29]

291 The women and pubescent girls, young and old, single and married, always wear the hip cord.

[293] Some pregnant women I saw did not wear it; I believe they had freed their abdomen from this strong pressure in order to breathe more easily, or perhaps for fear that the girdle should have a pernicious influence on the foetus.

302 They always wear their hair long, hanging over the shoulders; they clip it irregularly on the forehead with a bivalve shell or a cane splinter. They liked to have us cut it with scissors.

291 They are extremely fond of the hats we wear; it seemed to me that the heat of the sun on their head distressed them greatly. They will give almost as much for a hat as for an iron axe.

301 One of the jaguar-hide helmets which are now in the [National] Museum was obtained in the village of Urutau in exchange for an old and well-worn hat of ours, in spite of the fact that those helmets are highly prized [by the Indians].

They do not normally wear hide or feather head ornaments. When they are in a festive mood, they cover themselves with crowns [diadems] that will be described later, or with jaguar-hide helmets. It is likely that they also use such ornaments for certain ceremonies, but we ascertained nothing about this.

[Fig. 32]

[240] From their ears they hang triangles of mother-of-pearl, [304] which they extract from river shells; when the hole tears, splitting the lobe in two, they do not hesitate to bore another one.

[512] The men are much vainer than the women; they adorn themselves with feather diadems, earrings, pendants and necklaces, while the women limit themselves to a few of these.

301 imitate our wedding rings; necklaces [242], several meters long, made of black beads; the feathers of black birds; the limbs of coleopters, also black; all arest to this preference.

[Fig. 45]

[237] The women make beautiful one-piece bracelets from the tail rings of the giant armadillo which they polish with wet stones. [See Fig. 65, p. 58A]

[314] The Uaintaçu Nambicuara, who come to Campos Novos by way of the Guaporé and who are much more insolent, crude, wary and suspicious, do not attempt to wear the delicate lip plugs used by their relatives.

Some of them wear a porcupine quill fastened to their lip; others, a wooden splinter or a spike from some tree.

291 562 Also characteristic of the whole Serra do Norte and Juruena Valley is a palm-fiber cape (ialaçu), which hangs down the backbone from the neck. [See Fig. 66, p. 59B.] Women do not wear it; it is another example of male foppishness.

302 Body painting with urucu constitutes part of the ornamentation for men as well as for women.

[Plates, p. 236]

[243] They paint themselves on festive occasions; they do not draw lines on the skin, but smear the dye all over their face. Women, [515] after bathing, redden their whole body in this fashion.

[Fig. 44]

[284] The Indians of the Juruena dissolve the urucu powder in pure water; the Tagnani prepare a paste or cream by mixing the dye with the fat of various animals, and perfume it quite pleasantly by way of some unknown process. (1)

1. The Bororo use mastic resin to perfume the urucu paste. See Alfredo de Andrade, "Estudo dos materiaes corantes [A Study of Coloring Materials]," Archivos do Museu Nacional, Vol. 28, p. 183.

Amunze women.

Tawite camp at Tres Buritis.

[280] [One necklace not mentioned earlier] is made with the seeds of a Cyperacea (tanielkerê) which the Suya of the Xingu River also use. . . . .

Oradaikrusê is a beautiful bracelet made with the tail rings of the giant armadillo (Dasypus gigas). It looks like ivory. Other bracelets are made from the nuts of the babassu and pindova (Orbignya speciosa) palms.

[Fig. 65]

Bands for the upper arm are made of cotton and fastened similarly to those of the Paressi.

The jalaçu is a simple fiber cape, widely used, which fastens to the neck and hangs down the back. There is also a black feather cape in the collection.

[281] The stem of the unetizú (nose plume) is made of thin bamboo or the stalk of a tough grass (Andropogon).

. . . . The helmets of puma or jaguar hide are used in that region only by the Nambicuara and by the Cayabi of the Paratininga.

[Fig. 66]

Max Schmidt broadly classified Brazilian Indian plaiting into Palmblattflechterei (palm-leaf plaiting) and Doppelfadengeflechte (double-strand plaiting). But he also admired the existence of a third type, where two elements running in different directions are crossed by a third. This type occurs frequently on the Xingu River ; . . and is found in Nambicuara baskets (atiçú).

[282: page of figures]

[283] As plaiting material the Nambicuara use titara liana and sometimes bamboo.

. . . . Nambicuara fans, made with bacaba leaves, . . . are of pentagonal shape . . . .

A kind of nose flute made of gourd discs (hait-tratiçú) seems to have been borrowed from the Paressi.

[Fig. 67]

The double flutes were borrowed from the Tapajos tribes (Mundurucu, Maue, etc.). [See fig. ...(70, p.]

collectively obliged to make reprisals for an injury done one of its members. Much more often, given the very lively and permanent animosity which reigns between the groups, these pretexts good for exciting the spirit are voluntarily entertained, especially if they feel strong either because of the importance of the group's strength or because of an alliance with neighboring bands against a common enemy, concluded by the intermediary of messengers acting as ambassadors. The proposition of war is presented by an exalted individual or one who exposes before his companions his particular griefs, in the same tone and style that speeches were made at the encounter.

39. ẽ akinaẽ ẽednaẽ ũdegaẽ kakoŋẽ ordnẽ ŋalaŋrẽŋẽ. (b1) whose approximate sense is: "Hello! Come here! Let's go! I am irritated! very irritated! arrows! big arrows!" The Indians become so excited upon the occasion of these epic speeches that it is not possible to obtain the commentary of the formula except well after they have been cited and undoubtedly very unfaithfully. But war is not a matter of purely profane decision. It necessitates a preliminary ceremony which will determine if the signs are favorable or not. Dressed in special attire, tufts of buriti straw dappled with red, hoods of jaguar skin, the men assemble under the leadership of the chief and execute the special dance and chant of war. (1) A divining rite

1. Dances and music will be the object of a special publication.

is then performed. The chief, or the sorcerer in the groups where he exists, goes solemnly to hide an arrow in a corner of the bush. The arrow is retrieved the next day. If it is covered with blood, the expedition is undertaken, if not, it is given up. (2) Many warlike

2. This symbolic use of an arrow seems typical of cultures situated north of the Amazon. The fact is interesting, given the northern affinities of the Nambikwara language. Concerning the use of the arrow as the message of war, cf. Roth, "An inquiry," etc., Annual report of the Bureau of American Ethnology, 30, p. 302; Koch-Grünberg, Zwei Jahre unter den Indianern, etc., Berlin, 1910, Vol. II, p. 316; Gumilla, Historia Natural del Rio Orinoco, Barcelona, 1791, Vol. I, p. 134.

expeditions thus begun end after several kilometers of marching.

ORNAMENTATION

301 The Eastern Nambicuara also make a wide
306 assortment of ornaments from tucum nuts, shell, teeth, and bamboo. From the shell of the tucum nut they make black washers which are strung for necklaces or ear ornaments. The irregular-shaped washers are first ground down to an almost paper-like thinness on a piece of sandstone. They are then strung tightly on a string and the maker begins to rub them against a stone in order to make them circular. He continues rubbing until the washers are no more than a quarter of an inch in diameter, for the smaller the washer the more highly the necklace is valued, so this process takes many weeks.

301 The ear-lobes of both men and women are per-
304 forated so that tucum shell washers, beads on a string, and triangular pieces of shell can be suspended from them.

The septum of the nose and the upper lips of men are perforated. Through the hole in the septum they force a slender piece of bamboo about 2 inches in length. These adornments give a peculiar expression to the face, particularly when the man is speaking. Julio was especially proud of these ornaments and claimed that white men were just like women because they did not wear them. On special occasions a blue macaw feather about 10 inches long with a bunch of red feathers near the lower end is worn in the nose. Only shamans wear a hat made from jaguar skin.

301 The most popular necklace is made from tucum washers and is worn by men, women, and children. Short lengths of bamboo, monkey teeth, jaguar teeth and claws are also used for making necklaces for men. If very long, any necklace can be worn over one shoulder and under the arm. A special type of necklace for men is made by suspending black muscovy feathers from a string alternating with lengths of bamboo. Generally the feathers also alternate, some being long and some short. A rare but highly valued necklace is made from the shiny black horns of a large beetle.

Arm bands about an inch in width made of woven cotton are worn above the biceps by both men and women. From these, men suspend tassels of buriti fiber. This fiber is also worn around the wrists and ankles. Wrist bands are also made for women from the tail of the armadillo.

Fig. 68. Imitation of a straw hat made by a Juruena River Indian.

[280] [One necklace not mentioned earlier] is made with the seeds of a Cyperacea (tanieikerê) which the Suya of the Xingu River also use. . . . .

Oradaikrusê is a beautiful bracelet made with the tail rings of the giant armadillo (Dasypus gigas). It looks like ivory. Other bracelets are made from the nuts of the babassu and pindova (Orbignya speciosa) palms.

[Fig. 65]

Bands for the upper arm are made of cotton and fastened similarly to those of the Paressi.

The jalaçu is a simple fiber cape, widely used, which fastens to the neck and hangs down the back. There is also a black feather cape in the collection.

[281] The stem of the unetizú (nose plume) is made of thin bamboo or the stalk of a tough grass (Andropogon).

. . . . . The helmets of puma or jaguar hide are used in that region only by the Nambicuara and by the Cayabi of the Paratininga.

[Fig. 66]

Max Schmidt broadly classified Brazilian Indian plaiting into Palmblattflechterei (palm-leaf plaiting) and Doppelfadengeflechte (double-strand plaiting). But he also admitted the existence of a third type, where two elements running in different directions are crossed by a third. This type occurs frequently on the Xingu River . . . and is found in Nambicuara baskets (atiçú).

[282. page of figures]

[283] As plaiting material the Nambicuara use titara liana and sometimes bamboo.

. . . . . Nambicuara fans, made with bacaba leaves, . . . are of pentagonal shape . . . .

A kind of nose flute made of gourd discs (hair-tsaçú) seems to have been borrowed from the Paressi.

[Fig. 67]

The double flutes were borrowed from the Tapajos tribes (Mundurucu, Maue, etc.). [See fig. . . . (70, p.]

It is a curious fact that palm cabbage (palmito) is not utilized by the Serra do Norte Indians. Gabriel Soares [234] made it clear in 1587 that the aborigines of the coast prized the leaf buds of the palm tree: "Stupendous palm cabbages, five or six spans in length and as thick as a man's leg, are extracted from the buds of these palms."

Pineapple wine was a common beverage, for Soares goes on to say: "The nature of this fruit is hot and humid, and it is very harmful to those with open wounds or sores; the same pineapples, when green are good for curing sores, for their juice eats away all the rotten and putrid flesh, and the aborigines know this; in such wise does this fruit eat away, that they use its rind to wipe off the rust from their swords and knives and to remove the stains from the clothes they wash; when ripe, the juice is used by the Indians to make a wine which inebriates them; to this end they pluck the fruit not quite ripe, on account of its being more sour..."

The Indians of the Serra do Norte found our salted food unpleasant. They often refused the plates we set before them, giving us to understand that it was the salty flavor which led them to behave in this manner.

Milk (condensed milk) was also rejected in the beginning; they would make a face and say that it was human milk and therefore repulsive: [235] "Anungú!"

One must know the Indians' gluttony, their insatiable hunger, their continual, unfailing, artless, persistent animus devorandi, fully to comprehend the disgust which led them to such a renunciation.

The children are given to eat of everything; no matter what goes into an Indian's mouth, there is always a crumb for the little one who walks beside him or rests in his arms.

Even the stimulants they use--tobacco, for instance--are shared with the children. More than once I had the opportunity to observe Indians giving cigarettes to children under two. (1)

knowing if the type of life of the Nambikwara, apparently very primitive, does or does not constitute the authentic vestige of ancient conditions. Considered in the present, their level of culture is certainly very low. They live naked, especially the women, who only wear a thin string of buriti beads around the waist, some earrings, necklaces worn around the neck or looped over the shoulder, [14] bracelets made from the tail of the large armadillo, and, sometimes, some narrow bands of cotton woven by their husbands, or some buriti straw, tightly bound around the biceps, and wooden pins. Besides the same ornaments, the men sometimes put on a sort of straw pompom, fastened to the waist above the sex organs, and smaller ones, attached to cotton bracelets; on the other hand, they do not wear shell bracelets. The complete ignorance of the hammock and the Nambikwara
[513] custom of sleeping on the ground (or, more rarely, on long strips of the bark of the palm tree paxiuba) has intrigued ethnologists for a long time. This sentiment is shared by neighboring tribes, and the
[101] Paresi, mentioning this peculiarity, call the Nambikwara Uaihnakorê, "those who sleep on the ground."

221 The Nambikwara year must be divided into two distinct periods. During the rainy season (from October to March), each group settles on some small elevation rising above the course of some stream. The Indians then construct crude huts with curious variations in form and materials. They burn clearings in the approaches to the forests which
221 occupy the humid valley floor, and there they plant and cultivate
241 gardens principally with the starch-yielding plants of the manihot genus (sweet and bitter) and tobacco, sometimes some peas, cotton, peanuts, and calabash (Lagenaria sp.). They grate the yucca (manioc) on planks covered with the sharp bark of the palm tree, they press it with the aid of a piece of twisted bark. The garden produce furnishes food resources sufficient for part of the sedentary period, and even of the later: the Nambikwara preserve the yucca by burying the residue of the 'grated' pulp in the ground.

221 At the arrival of the dry season, they abandon the village, or rather the site of temporary residence, and each group "breaks up," if one can say that, into several nomadic bands. For about seven

648 37. tamaĩn ãme munẽtiere munẽtiẽnẽtiore nãnĩ' (bl)
609 The Tamandé sing well; as for me, I cannot sing well any more!
201 In one case which we witnessed, the general tone was quickly raised with the excitement of the meeting, and the night had not yet ended before the speeches mixed with chants made an extraordinary uproar, whose significance escaped us completely. Menacing gestures were outlined, sometimes even some scuffles were produced while other Indians intervened as mediators. All of these hostile manifestations are stylized, and end as gestures calling to mind sexual parts of the body. On the part of the aggressor, menace, or the gesture of Nambikwara hostility, consists of seizing the penis with two hands and directing it towards the adversary while inflating the stomach and thrusting it out, and of flexing the knees (the men also make this gesture in fun toward children when they wish to get rid of them). The second stage consists of an act of aggression toward the person
[291] of the adversary, with a view to tearing off the piece of buriti straw attached to the front of the waist, above the sex organs. The latter "are hidden by the straw" and "they fight to tear away the straw." This action is entirely symbolic, for the covering of the male sex organs is made of such fragile material and is reduced so small in size (and often non-existent) that it is out of the question for it to assure protection of or be any kind of covering for the organs. Another form of aggression consists of seizing the adversary's bow and arrows and laying them aside. In all of these actions the attitude of the Indians is extremely tense as if they were (and really, they are) in a state of violent and contained anger. Doubtless these brawls degenerate at times into generalized conflicts, but in our case, they calmed down at dawn. Always [93] in the same state of apparent irritation, and with gestures devoid of friendship, the adversaries looked at one another to inspect one another, rapidly
[301] feeling the earrings, the cotton bracelets, the little feather ornaments, while murmuring rapid words:

38. nãhã nãhã kãhã kãhã mutintti (bl)
Give, give, see, see, it is pretty!

648 This "inspection of reconciliation" marks the normal conclusion
639 of the conflict. And actually it is this which introduces the new aspect which the relationships between the two groups are going to take--commercial exchanges. However summary the material culture of the Nambikwara may be, the products of the industry of the different groups are highly prized by their neighbors. The eastern groups need pottery and seeds; the northern and central groups consider

He was completely naked, that is, divested of his
756 necklaces, bracelets, earrings, and belt, and by the light of our
[30] electric lamps we could make out his tragic expression and his pale complexion. He let himself be helped to the camp without difficulty, where he sat down without a word and in a completely impressive attitude of dejection. Little by little, his story was drawn from him by an anxious listener. He explained that he had been carried off by the thunder (amã), [a storm had broken the same day]; the thunder had carried him in the air to a point which he designated at a distance of 25 kilometers from the camp (Ananáz River), had divested him of all his ornaments, then brought him back the same way and left him in the place where we had discovered him exhausted. Everyone went to sleep commenting on the incident and the next morning, C20 had recovered not only his habitual good humor, but also all his ornaments, which amazed no one and for which he offered no explanation. But the following days a very different version of the event began to be peddled by the Tarundé. They said that, far from having entered into relationship with the other world, C20, under the cover of a magical disappearance, had gone to undertake
[574] some transactions with a band of Sabané Indians who were camping in the vicinity. These insinuations were never developed further, and the official version of the affair continued to be ostensibly admitted. However, in our personal relationships, B1 let his preoccupations be seen upon several occasions. As the two groups left us shortly after, we never found out the outcome of the story.

756 No information has been uncovered concerning the manner of
279 naming the shaman as such. In the preparation of the arrow poison, C20 was assisted by his potential son-in-law C25.

• • • • • •

622 [104] Besides his supernatural attributes, the chief, or shaman,
756 plays another role, that of "leader" in ceremonies and celebrations.
796 The Nambikwara have three types of ceremonies. Those which mark the critical moments of each one's existence, such as birth, initiation, puberty, marriage, death; the seasonal festivals; and finally, the ceremonies celebrated on exceptional occasions: war and hunting or scavenging expeditions. We have already alluded to the rites of war, and we shall speak farther on of the ceremonies of the first type. We shall limit ourselves here then to some brief observations concerning the others.

342 shelter and lights its own fire in the opening. During the rainy season,
[361] villages consisting of one or more beehive huts are built on slight hillocks above the course of a secondary stream. Some of the *Eastern Nambicuara* build only shelters, although larger and stronger than the ones described. The beehive hut is very light, each about 10 to 20 feet (3 to 6 m.) in diameter. The frame consists of several long, supple poles, bent so that both ends can be stuck into the ground and tied together at the top, where they cross. Circular branches running horizontally are tied to the poles at different levels. The *Central* and *Western Nambicuara* have a more elaborate hut (pl. 37, *top*) whose perimeter is about 50 feet (15 m.). It has a central post from the base of which several forked poles run obliquely to support the bent poles of the external frame. All types of huts are thatched with horizontal layers of palm leaves, those of *Central* and *Western Nambicuara* exactly like the houses of their southern neighbors, the *Kepkiriwat*.

A gabled house without walls was also observed by Roquette-Pinto, who recorded other kinds of temporary huts. Some were built by sticking two branches into the ground, bending them over and attaching them to a horizontal pole tied to two perpendicular posts and covering them with bunches of grass.

352 The *Nambicuara*, although all their neighbors use hammocks, sleep on
513 bare ground or on flat pieces of bark from the paxiuba palm. Because of this custom, the *Paresi* nicknamed them *Uaikoakóre*, "Those Who Sleep on the Ground."

CLOTHING AND ADORNMENT

[291] Both sexes are naked, except that men sometimes tie a small tuft of
● 301 burity straw to their belt to cover the sex organs. Both men and women wear a thin, cotton-thread belt strung with white or black beads cut from river mollusk shells or from tucumã palm nuts. Such beads, with larger triangular pieces of mollusk shells, are also used for necklaces, earrings, bracelets, and other ornaments. Men wear grass or reed pins through their upper and lower lips; and, through their nasal septum, a larger pin made of a jacu (*Penelope*) feather mounted on a stalk covered with plaited cotton thread and porcupine quills and trimmed with a red toucan feather ring. Both sexes wear armlets and anklets of woven cotton, burity straw, feathers, parts of dried birds, fur, or mollusk or crawfish shells. Women wear one or more bracelets cut from the tail of the great armadillo and double bandoleers of plaited cotton dyed with urucú and decorated with porcupine quills. Hair ornaments are confined to men: circlets of plaited straw, of straw and and toucan feathers, or of fur with
[714] feather pendants. War dress consists of a jaguar-skin bonnet (pl. 36, *top, left*) with a long, plaited buriti-straw tail painted with red stripes And dots hanging down from the nape of the neck.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life. 301

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard. 302 [386]

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton. 481 501 354

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string. 283

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Aruwak*" type (pl. 37, *center, right*). 286

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour. 285

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark. 323 [314]

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood. 412 [372] [373]

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the 411

[end plate 1]

283 breaks down. After one-half hour the starchy material is washed out and the ribbons begin to separate into fine strands of fiber. The bunch is then shaken out and hung up to dry. When of good quality, that is, when the reed is of the right age, the fibers dry out a pale cream color. While the man is occupied at this task the girls make temporary necklaces from the green outer skin and the boys use the thin central stems as arrows for their small bows. These dried-out bunches are a favorite decoration of the Nambicuara when painted with horizontal bands of urucú. They can then be suspended from the neck and allowed to hang down the back, or pieces are attached to the arm bands, leg bands, and in front to the belt. [301]

Cotton twine is used for making arrows, stringing beads, weaving arm bands and the narrow shoulder straps which women use for carrying young children. From the cotton bush (*kúsalau*) the woman picks the balls (*kúsalíxu*) to make cotton twine (*kúsalíxu*). As the making of buriti twine is a man's task, so the making of cotton twine is purely a woman's task. After picking the seeds from the balls she spreads the cotton into flat disks and then into circles. Next she breaks the circles and joins them to form a long rope about an inch in diameter. This rope she winds around her arm, twists the end of it with her fingers, and fastens it to the top of a spindle (*unuhíxu*). With a twirl of her fingers she sets it spinning and lets it drop, plucking out the cotton as it is spun. Later she unties the string and fastens it near the whorl and then by spinning the spindle on the ground the twine is wrapped around it. This process is repeated until the cotton rope is used up.

286 The men do the weaving on a true but very makeshift loom. Two forked sticks, roughly a yard long, are thrust into the ground about 2 feet apart and at an angle. One cross bar rests in the forks while another is fastened on near the ground. The warp is wound around these cross bars. The heddle, shuttle, and sword are used in weaving the narrow material. It seems very likely that this type of loom was taken over from the Arawakan Parecí. [177]

The bast strap or band (*se'ew*) is made from embira and is used for pressing manioc pulp, for carrying children or baskets, and, when cut into strips, is used for tying up bundles.

[p. 95 ED]

ORNAMENTATION

301 The Eastern Nambicuara also make a wide
306 assortment of ornaments from tucum nuts, shell, teeth, and bamboo. From the shell of the tucum nut they make black washers which are strung for necklaces or ear ornaments. The irregular-shaped washers are first ground down to an almost paper-like thinness on a piece of sandstone. They are then strung tightly on a string and the maker begins to rub them against a stone in order to make them circular. He continues rubbing until the washers are no more than a quarter of an inch in diameter, for the smaller the washer the more highly the necklace is valued, as this process takes many weeks.

301 The ear lobes of both men and women are per-
304 forated so that tucum shell washers, beads on a string, and triangular pieces of shell can be suspended from them.

The septum of the nose and the upper lips of men are perforated. Through the hole in the septum they force a slender piece of bamboo about 2 inches in length. These adornments give a peculiar expression to the face, particularly when the man is speaking. Julio was especially proud of these ornaments and claimed that white men were just like women because they did not wear them. On special occasions a blue macaw feather about 10 inches long with a bunch of red feathers near the lower end is worn in the nose. Only shamans wear a hat made from jaguar skin.

[292] [156]

301 The most popular necklace is made from tucum washers and is worn by men, women, and children. Short lengths of bamboo, monkey teeth, jaguar teeth and claws are also used for making necklaces for men. If very long, any necklace can be worn over one shoulder and under the arm. A special type of necklace for men is made by suspending black mutum feathers from a string alternating with lengths of bamboo. Generally the feathers also alternate, some being long and some short. A rare but highly valued necklace is made from the shiny black fleurs of a large beetle.

Arm bands about an inch in width made of woven cotton are worn above the biceps by both men and women. From these, men suspend tassels of buriti fiber. This fiber is also worn around the wrists and ankles. Wrist bands are also made for women from the tail of the armadillo.

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galera, affluents of the Guaporé. In 1908, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákoré and Ouihanaré to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabirí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guayourú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabirí those Indians whom the Parecí called Uáikoákoré, and who, as now stated, are Nhambiquára. This name of Uáikoákoré is given by the Parecí of the sub-tribes Kazinitti and Waimaré of the rivers Aripes, Sacuriú-iná, Tabóra-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Celozal and Jauruí. The term Kabirí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of coconut. They wear armlets, bracelets, leg ornaments and head collars made from the fruit of the mucúmba. They live by the chase, but also plant maize, yams, potatoes, manioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-otziri and the Amúsos of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kóshó of the Parecí, made from pounded manioc. The native *breu* or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Ouaiuí and wax, and is preserved in leaves of the Malé-malé palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutum feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 38 in length. To draw an arrow of 50cm. between the longer bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malé-malé and breu. The upper disk has three orifices.

301

Fig. 38. Cotton arm band.

291 around the ankles. The Tagnani and Tawite wear similar bands on
189 their upper and lower limbs; theirs, however, are made of cotton, which is used occasionally by the Cocoma to manufacture articles of this sort. [Plates p. 242.] Among the Tagnani and Tawite [238], men often cover their sexual organs with the ends of the straw cord that encloses their hips. But this is not the rule. The Uaintaçu rarely wear any of those bands; and among all groups, a few of the Indians always go completely naked.

[Fig. 29]

297 The women and pubescent girls, young and old, single and married, always wear the hip cord.

[298] Some pregnant women I saw did not wear it; I believe they had freed their abdomen from this strong pressure in order to breathe more easily, or perhaps for fear that the girdle should have a pernicious influence on the foetus.

342 They always wear their hair long, hanging over the shoulders; they clip it irregularly on the forehead with a bivalve shell or a cane splinter. They liked to have us cut it with scissors.

291 They are extremely fond of the hats we wear; it seemed to me that the heat of the sun on their head distressed them greatly. They will give almost as much for a hat as for an iron axe.

● 301 One of the jaguar-hide helmets which are now in the [National] Museum was obtained in the village of Urutau in exchange for an old and well-worn hat of ours, in spite of the fact that those helmets are highly prized [by the Indians].

They do not normally wear hide or feather head ornaments. When they are in a festive mood, they cover themselves with crowns [diadems] that will be described later, or with jaguar-hide helmets. It is likely that they also use such ornaments for certain ceremonies, but we ascertained nothing about this.

[Fig. 32]

[240] From their ears they hang triangles of mother-of-pearl, [304] which they extract from river shells; when the hole tears, splitting the lobe in two, they do not hesitate to bore another one.

[562] The men are much vainer than the women; they adorn themselves with feather diadems, earrings, pendants and necklaces, while the women limit themselves to a few of these.

?Roquette-Pinto--34 E-4,5 (no date) 1938 SP17 Nambicuara SP17
(ca. 1912)

304 Only the men have pierced upper lips and nasal septa; the women, never.

Children still at the breast did not have their lip or septum perforated; but those whose first milk molars had appeared already had both areas pierced. Hence I believe that this operation is not performed until boys have reached the age of two.

●301 Not until they are five or seven do they begin to insert through the lip and nose perforations some thin and distinctive plugs nearly always made of reed stems.

Their use is widespread in the Serra do Norte; I have seldom seen Indian men without those plugs.

[Fig. 35]

The lip plug rests between the median upper incisors and protrudes aggressively upward; the septum plug is thicker and shorter. Both are cut to the appropriate size by means of fire.

[341] If the plugs fall out, the wearer immediately retrieves them and sets them back in the perforations; on those few occasions when [the Indians] removed them to show us how they were fastened, they promptly replaced them as if ashamed to be deprived of their ornaments.

As a rule they wear both simultaneously. Some Indians prefer to the modest nose plug another adorned with a macaw or curassow feather.

[584] Contrary to what used to be thought, these ornaments do not seem to constitute marks of distinction or signs of hierarchy.

We saw youths of eighteen adorned with such plumes; none of the Indians accorded them the least importance.

When they wear these feathers, they forego the lip plug.

Their predilection for black beads is remarkable; they make them from the shells of small palm nuts to form multi-looped necklaces, and when we offered them an assortment of glass beads they chose the black ones at first. Yet they ended up choosing all of them... They are insatiable.

Nevertheless, their ornaments are predominantly black in color. Black bracelets; rings made with black palm nuts which they used to wear as ear pendants and which they carry now on their fingers to

7/Roquette-Pinto--644 E-4, 5 (no date) 1938 SP17 Nambicuara SP17 (ca. 1912)

301

Fig. 39. Irunguinindé--necklace made with the seeds of a Sapotacea (Lucuma sp.).

301 imitate our wedding rings; necklaces [242], several meters long, made of black beads; the feathers of black birds; the limbs of coleopters, also black; all attest to this preference.

[Fig. 45]

[237] The women make beautiful one-piece bracelets from the tail rings of the giant armadillo which they polish with wet stones. [See Fig. 65, p. 59A]

[238] The Uaintacu Nambicuara, who come to Campos Novos by way of the Guaporé and who are much more insolent, crude, wary and suspicious, do not attempt to wear the delicate lip plugs used by their relatives.

Some of them wear a porcupine quill fastened to their lip; others, a wooden splinter or a spike from some tree.

301 562 Also characteristic of the whole Serra do Norte and Juruena Valley is a palm-fiber cape (ialacu), which hangs down the backbone from the neck. [See Fig. 66, p. 59B.] Women do not wear it; it is another example of male foppishness.

302 Body painting with urucu constitutes part of the ornamentation for men as well as for women.

[Plates, p. 236]

[243] They paint themselves on festive occasions; they do not draw lines on the skin, but smear the dye all over their face. Women, [515] after bathing, redden their whole body in this fashion.

[Fig. 44]

[239] The Indians of the Juruena dissolve the urucu powder in pure water; the Tagnani prepare a paste or cream by mixing the dye with the fat of various animals, and perfume it quite pleasantly by way of some unknown process. (1)

1. The Bororo use mastic resin to perfume the urucu paste. See Alfredo de Andrade, "Estudo dos materiaes corantes [A Study of Coloring Materials]," Archivos do Museu Nacional, Vol. 28, p. 183.

237 301 Featherwork is scarce and in fact insignificant. One of the illustrations in this book [p. (60B)] shows an interesting feather diadem patterned after an object of similar type but of admirable craftsmanship which the Indians purloined from their neighbors to the west and which is also to be found in the [National] Museum. (2) [Fig. 42]

2. Semicircular straw head ornaments are to be found mainly in the state of Amazonas as well as among the Huari of the Guaporé River, who resemble the Nambicuara in their primitive axes, their circular houses, etc. (Cf. Nordenskjöld, "The Ethnography of South America Seen from Mojos in Bolivia." [Engl.]).

The use of cotton has given an extraordinary boost to the development of featherwork among the Tupian Indians, as I demonstrated with the gorgeous ornaments made by the Urubu Indians (Gurupi River). The Nambicuara are familiar with cotton, but have not even developed featherwork based on plaiting or netting; this seems to attest to a tradition poor in such textile techniques. The Guayaki, who are Tupian Indians of rudimentary culture, according to Vellard, have neither featherwork nor agriculture. (R. L.)

535 We were able to observe two types of dances: a war dance which we recorded in a film shown at the National Library [of Rio de Janeiro] on March 15, 1913, and in which Indians of the Cocozu,

A. Arezi mushroom (Poliporus sp.) eaten by the Serra do Norte Indians.

B. Cord of monkey hair (Pithecia satanas).

C. Necklace made with minute shreds of feather stems.

D. Ornamental motif of the Serra do Norte Indians.

301 [280] [One necklace not mentioned earlier] is made with the [529] seeds of a Cyperacea (tanieikerê) which the Suya of the Xingu River also use. . . . . .

Oradaikruzê is a beautiful bracelet made with the tail rings of [525 237] the giant armadillo (Dasypus gigas). It looks like ivory. Other bracelets are made from the nuts of the babassu and pindova (Orbignya speciosa) [524] palms.

[Fig. 65]

Bands for the upper arm are made of cotton and fastened similarly to those of the Paressi.

291 The ialaçu is a simple fiber cape, widely used, which fastens to the neck and hangs down the back. There is also a black feather cape in the collection.

301 [281] The stem of the unetizú (nose plume) is made of thin bamboo or the stalk of a tough grass (Andropogon).

. . . . The helmets of puma or jaguar hide are used in that region only by the Nambicuara and by the Cayabi of the Paratininga.

[Fig. 66]

285 Max Schmidt broadly classified Brazilian Indian plaiting into Palmblattflechterei (palm-leaf plaiting) and Doppelfadengeflechte (double-strand plaiting). But he also admitted the existence of a third type, where two elements running in different directions are crossed by a third. This type occurs frequently on the Xingu River . . . and is found in Nambicuara baskets (atiçú).

[282: page of figures]

[283] As plaiting material the Nambicuara use titara liana and sometimes bamboo.

[293] . . . . Nambicuara fans, made with bacaba leaves, . . . are of pentagonal shape . . . .

534 A kind of nose flute made of gourd discs (hait-teataçú) seems [171] to have been borrowed from the Paressi.

[Fig. 67]

The double flutes were borrowed from the Tapajoz tribes (Mundurucu, Maue, etc.). [See fig. . . .(70, p.]

174

but smooth-edged axes, is more akin to the proto-Neolithic or transitional period. The present trend is to recognize in the New World Paleolithic industries . . . but no formal overlapping periods as in Europe. (R. L.)

A later footnote by Heloisa Alberto-Torres which is not reproduced here contains the following statement: ". . . an interesting ethnographic relationship is [established by] the absolute identity of Australian and Nambicuara axes . . ." (Ed.)

At first observation, the Nambicuara might seem to be an old and backward branch of the Paresi tribe.

[308] What we know of the physical anthropology, ethnography and linguistics of both groups, however, invalidates this supposition.

177 Yet their culture bears unmistakable signs of Paresi influence.
[342] The first is the beehive-shaped house, formerly built by the Paresi. This is an import among the Nambicuara; the original house of the Serra do Norte Indians is the screen of leaves and branches, similar to the kijême of the Botocudo (Windschirm of the German ethnologists) and reminiscent of the North American wigwam.

[Fig., p. 61A]

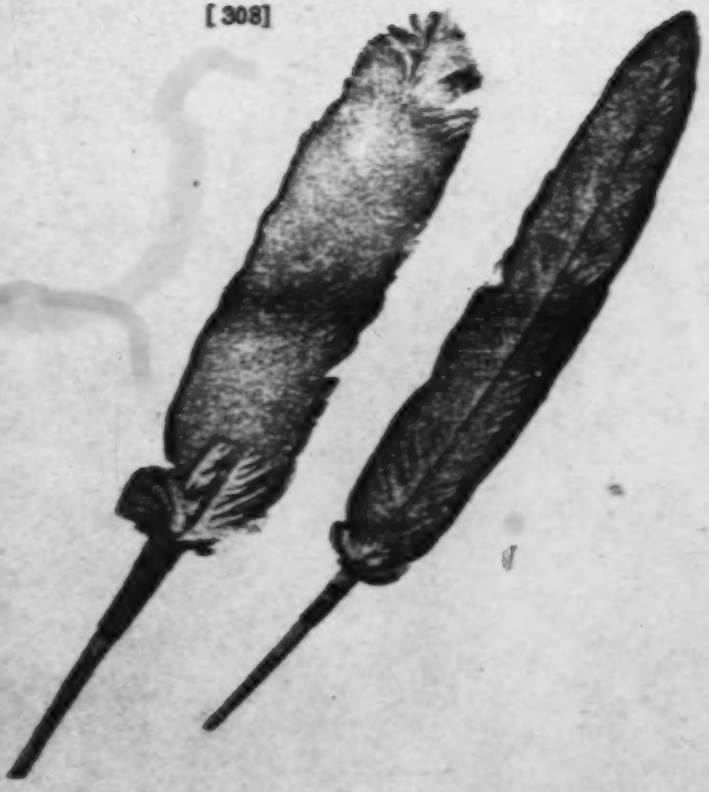
[309] And if they did not borrow the large "round house" from the Paresi, they adopted it from Bolivian Indians.

[310] Another instance of alien influence is the nose plume, which the Paresi do not wear now but which formerly, according to Antonio
177 Pires, they could not do without; and also the nose flute, which
534 [the Nambicuara] play unskilfully, as though it were a little-known instrument of yet unfathomed secrets.

The double flute seems to have been brought from the north. It must be an import from the Maue and Munducuru, with whom the Serra do Norte Indians have had serious clashes as already mentioned above.

7:Roquette-Pinto--61A E-4, 5 (no date)1938 SP17 Nambicuara SP17
(ca. 1912)

301



Nose ornament.

[Fig. 70]

177 Their plaiting follows patterns clearly characteristic of the
[288] Xingu (Trumai and Nahuqua) and gives proof of contact with those backward tribes which the rudimentary culture of the Nambicuara had already implied.

[289] The quadrangular barbecue, which differs from the usual pattern, is used only by the more advanced groups (Tagnani, etc.); it recalls the barbecue of the Javahe as depicted by Fritz Krause. (1)

1. F. Krause, In Den Wildnissen Brasiliens [In the Brazilian Wilderness] (Leipzig, 1911).

●[290] The straw ornaments of the Nambicuara are quite similar to
197 those of the Suya. But linguistic affinities are even more indicative of contact between the two groups. No other people speaks a dialect [310] so similar to that of the Nambicuara in terms of word morphology, although the two languages are otherwise quite different.

171 It is interesting that a spontaneous affinity should arise be-
177 tween two remote and equally primitive tribes, the Guayaki of Paraguay and the Nambicuara of the Serra do Norte, from their common use of the jaguar hide helmet.

However, I am inclined to believe that the latter copied it from their neighbors, the Cayabi of the Parataninga River, who use helmets of the same material.

174 Unfamiliarity with the banana tree and with the pipe (an ob-
171 ject frequently encountered in North American mounds and Brazilian sambaquis) indicates how long the Nambicuara have been established in their mountain range.

Recognition of the Ge-Bororudo group as one of the oldest representatives of aboriginal South American populations is no longer a matter of dispute. . . . .

171 [311] There is no doubt, in my opinion, that the [Brazilian] linguistic groupings correspond to ascending stages of civilization [312]. . . . . The Serra do Norte is inhabited by a people of Ge culture evolving toward the Nu-Arawakan culture, of which they have barely reached the initial stages.

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life.

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard.

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton.

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string.

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Arawak*" type (pl. 37, *center, right*).

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour.

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark.

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood.

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the

[end plate 1]

291 Around the waist both men and women wear a buritĭ cord; if possible, this string is strung with glass store beads. In addition, men sometimes suspend a lenth of buritĭ fiber from the front of the belt.

●302 Men paint their faces with urucú, drawing a band from each side of the forehead down to the chin, another band across the eyes and bridge of the nose, and then a band from under each eye across the cheeks. On the body they draw two stripes, starting from the abdomen up to the nipples and then over to each shoulder. The arms and legs are dotted with red or black spots. The hair is seldom smeared with urucú.

SOCIAL ORGANIZATION

(See chart 13) 1/1

619 The names of the Eastern Nambicuara bands appear to be derived from characteristics peculiar
621 to the band territory. The Waklĭtisu are cayman people for there are many caymans (*waklisu*) in their territory. The Elótasu are open plains people, for they live on the open plain (*toku*) of the upper Camararé River. The Kitánhlu get their name from a small fruit called *tantu*. The Chiwáisu are bee people from the word *waisu*, bee. The Hégndisu are buritĭ fruit (*héeru*) people. Although these bands are not politically united under a single chief, and sometimes even resort to open conflict, they consider themselves a single people, or as Julio phrased it, "We can speak with one another and we came from the same hole in the stone mountain."

619 The origin myth of the Eastern Nambicuara, as
773 it is told among the Waklĭtisu band, can be summarized as follows:

Before the Nambicuara came there were only animals, birds, plants, and beings who could change from animal and bird to human form. At that time the Nambicuara were inside a stone mountain called *yahsinduruksisu*, which is situated north of the telegraph line near Campos Novos (roughly in the center of the territory now occupied by the Eastern Nambicuara). One day the monkeys heard people speaking inside the mountain and went to tell *oklihdítlisu* who changed himself into a black and white woodpecker and flew with all his strength against the mountain. When the mountain broke some were killed and some injured but many came out alive. The ghosts of the dead people remained around the mountain where they still are and where all Nambicuara go after they die. The injured people *oklihdítlisu* sent into the bush, but the people who were sound of body he put into good clean places and gave them the piuva bow and taught them how

1/1 [Cat. 116, p. 123.—Analysis] [p. 96 (A)]

881 baked manioc and other food which they have been preparing. When the messenger leaves with the food it is a sign that the men will return to camp after sunset.

Before the men arrive the women wash the girl and paint her with a mixture which includes latex from the rubber tree. A series of dots are painted on her face, breasts, abdomen, and thighs (pl. 6, *c* and *d*). When the men come in they dance in front of the girl's hut. She then comes out and is given a name and everyone tries to give her a necklace or some other object. During the night men and women join in the dance, holding hands and dancing in a circle, the dance steps being stamped out with the right foot in the direction in which the circle is moving. A special puberty song is also sung.

881 841 278 The Nambicuara tell of a strange medicine known only to the shamans which is given to girls during the puberty ceremony. It is a blue liquid which, when taken internally, stops menstrual bleeding for the remainder of the girl's life. The Waklítisu claim that they do not use it but that the other Eastern Nambicuara band do. The missionaries informed me that the Kitánrhu use this medicine, and the missionaries seemed to think that it was effective.

MARRIAGE

582 585 There is no special marriage ceremony, for when young people go through the puberty rites they are ready for marriage and a mate is selected for them by their parents. The young man, who 584 is to become the husband of a girl just out of 585 seclusion, goes to her parents and helps his future father-in-law build a small hut, and when it is finished the young man tells the girl to come out hunting with him. She takes a burden basket and they go off into the woods. In the afternoon the man builds a fire and tells the girl to prepare some food and honey. After the food has been eaten he tells the girl to come and lie beside him near the fire. She is supposed to resist and he takes a stick and threatens her. He then has sexual intercourse with her, and when they come back to camp that night they are accepted as a [587] married couple. When wives are acquired by inheriting the widow of a brother or by abduction from other bands, no ceremony is held.

Chapter VIII

Physical Anthropology and Pathology

123 [175] Unfortunately in 1912 the Nambicuara were not yet sufficiently accustomed to the presence of strangers in their mountains. In spite of their bribed willingness, they viewed my research with justifiable suspicion.

101 124 The Indians who were examined belonged to the following groups:[1] Cocozu, Anunze, Tagnani and Tawite [Tauité]. Among the Uaintacu, a still hostile group, I was able to gather only one incomplete set of data. The state of excitement of the Indian during the examination did not permit better results.

142 Their skin is the color of yellowish burned sienna, dark among the Cocozu, light among the others. Some Tagnani individuals have an almost pinkish complexion. Many nearly black types are found among the Indians of the Juruena and Juina rivers; those are the darkest Indians in Brazil. On the Roquette-Childe color scale used in the National Museum of Rio de Janeiro, the coloring of these Indians varies between numbers six and ten.

The skin is coarse and wrinkled.

The hair is straight and coarse (lissotrichous). Some individuals have wavy hair similar to that of the Polynesians. The Indians 302 usually pull out their body and face hair and cut it on the forehead with a bivalve shell. [176] A few of them leave some strands of hair above or below the lips.

[264] Nearly all permit their nails to grow freely, for they make useful implements to tear the meat at mealtime.

[147] The soles of their feet never become thickly callused as those of Negroes who go barefoot.

142 Their feet are relatively large, their legs slender and muscular. The abdomen is prominent, the hands small. The chest is knotty [encordoado] and not very large.

141 The measurements which we were able to obtain for normal adult males are shown in Tables A[2] and B.

164 These papery scales cannot be removed easily; I noticed that they did not come off when the woman scratched herself. I believe that the itching is much less severe at this time; it seemed more intense during the initial stages.

I cannot be definite about the time span of the disease. The symptoms evolve in a few days from the first to the second stage, but the latter seems quite prolonged.

[183] Some of the scabs contain incipient papery scales. However, as I had the opportunity to see only one woman and one girl, her daughter, whose bodies were entirely covered with the lesions of the last stage, I believe that the disease does not always reach this point. It may remain stationary at the second stage, or it may recede [involuir].

For the time being, therefore, I ascribe three stages to the disease:

(a) the cyst stage
(b) the scab stage
(c) the scale stage

I believe that these correspond to evolutionary phases of the same disease, and not to different diseases, because I found transitional forms on some of the affected individuals.

Besides, [the Indians] indicated by means of very clear signs that the final symptoms began with the cyst stage, the only one found in nursing children.

[757] The Indians spread saliva on the scabs; we do not know yet [278] whether they use any herb against the disease. They probably do, for veritable herbariums were found in their villages.

302 751 Another question that remains to be solved is the possible effect on the disease of the Indians' custom of painting their body with a greasy paste made from the juice of the urucu seeds. (1)

[113]

1. Alvaro Osorio de Almeida (in the Boletim do Museu Nacional, Vol. 7, 1931, No. 1) studies the reactions of skin painted with urucu to the actinic rays of light and to solar heat. His experiments led him to the following conclusions:

"Once smeared with urucu, the

302
751

Indians are as well protected against the actinic action of the sun as if they were wearing the thick clothing of the Sahara tribes. Because they are nude, however, the air circulates freely around their body, reducing the heat and hastening the evaporation of perspiration.

"If exposed to sunlight, in accordance with the property described above, urucu absorbs only slightly the heat of the sun, reflecting the red rays and also the heat rays. For this reason the white man or one with slight pigmentation, when smeared with urucu, does not perspire excessively as does the Negro under the same circumstances.

"In view of the properties ascribed to urucu by our experiments, and of the widespread usage of this dye among the Indians of tropical America, we believe that it should be considered not as merely ornamental but as an effective means of protection against tropical light and heat."

164 [184] The manifestations and evolution of the disease lead us to believe that it is a dermatomycosis. The habitat of the pathogenic fungus is probably to be found in the soil. This would explain why the personnel of the Line, who have lived among the Nambicuara for years, have not yet contracted the disease. This also applies to the Paressi, [513] who are now in contact with the diseased Indians. Both groups, unlike the Nambicuara, make use of hammocks and never sleep on the ground.

To this day, no microscopic examination of the scales has been made, and I am not responsible for this failure. In 1912 the Indians [123] would not allow us to collect the necessary materials; they were still suspicious.

291 around the ankles. The Tagnani and Tawite wear similar bands on
184 their upper and lower limbs; theirs, however, are made of cotton, which is used occasionally by the Cocozu to manufacture articles of this sort. [Plates p. 242.] Among the Tagnani and Tawite [239], men often cover their sexual organs with the ends of the straw cord that encloses their hips. But this is not the rule. The Uaintaçu rarely wear any of those bands; and among all groups, a few of the Indians always go completely naked.

[Fig. 29]

291 The women and pubescent girls, young and old, single and married, always wear the hip cord.

[843] Some pregnant women I saw did not wear it; I believe they had freed their abdomen from this strong pressure in order to breathe more easily, or perhaps for fear that the girdle should have a pernicious influence on the foetus.

● 302 They always wear their hair long, hanging over the shoulders; they clip it irregularly on the forehead with a bivalve shell or a cane splinter. They liked to have us cut it with scissors.

291 They are extremely fond of the hats we wear; it seemed to me that the heat of the sun on their head distressed them greatly. They will give almost as much for a hat as for an iron axe.

301 One of the jaguar-hide helmets which are now in the [National] Museum was obtained in the village of Urutaú in exchange for an old and well-worn hat of ours, in spite of the fact that those helmets are highly prized [by the Indians].

They do not normally wear hide or feather head ornaments. When they are in a festive mood, they cover themselves with crowns [diadems] that will be described later, or with jaguar-hide helmets. It is likely that they also use such ornaments for certain ceremonies, but we ascertained nothing about this.

[Fig. 32]

[240] From their ears they hang triangles of mother-of-pearl, [304] which they extract from river shells; when the hole tears, splitting the lobe in two, they do not hesitate to bore another one.

[562] The men are much vainer than the women; they adorn themselves with feather diadems, earrings, pendants and necklaces, while the women limit themselves to a few of these.

301 imitate our wedding rings; necklaces [242], several meters long, made of black beads; the feathers of black birds; the limbs of coleopters, also black; all attest to this preference.

[Fig. 45]

[237] The women make beautiful one-piece bracelets from the tail rings of the giant armadillo which they polish with wet stones. [See Fig. 65, p. 59A]

[184] The Uaintaçu Nambicuara, who come to Campos Novos by way of the Guaporé and who are much more insolent, crude, wary and suspicious, do not attempt to wear the delicate lip plugs used by their relatives.

Some of them wear a porcupine quill fastened to their lip; others, a wooden splinter or a spike from some tree.

291 562 Also characteristic of the whole Serra do Norte and Juruena Valley is a palm-fiber cape (ialaçu), which hangs down the backbone from the neck. [See Fig. 66, p. 59B.] Women do not wear it; it is another example of male foppishness.

302 Body painting with urucu constitutes part of the ornamentation for men as well as for women.

[Plates, p. 236]

[243] They paint themselves on festive occasions; they do not [515] draw lines on the skin, but smear the dye all over their face. Women, after bathing, redden their whole body in this fashion.

[Fig. 44]

[384] The Indians of the Juruena dissolve the urucu powder in pure water; the Tagnani prepare a paste or cream by mixing the dye with the fat of various animals, and perfume it quite pleasantly by way of some unknown process. (1)

1. The Bororo use mastic resin to perfume the urucu paste. See Alfredo de Andrade, "Estudo dos materiaes corantes [A Study of Coloring Materials]," Archivos do Museu Nacional, Vol. 28, p. 183.

302 Whenever they received good presents such as axes or beads,
[43] they would go to the brook and return with their whole face set ablaze by the blood-colored paint.

[609] This practice was carried out on outsiders by the Tagnani as a mark of special esteem. We were all granted this honor in Três Buritis...

The men do not pluck their pubic or axillar hair; sometimes they even grow a sparse mustache or an even sparser beard. The women depilate themselves completely.

487 [244] The foot paths they use are narrow, similar to cow paths in pastoral regions; in certain areas, the ground is criss-crossed with them. They also make lanes in the woods by cutting branches.

To cross a small river they make a footbridge by cutting down a tree on the bank and guiding its fall in the right direction.

501 If the river is wide, they make a bundle of muriti leaves as a float and allow the current to carry them diagonally across the stream.

[Fig. 36]

481 They are not familiar with the canoe or with navigation; they are good swimmers.

They walk fast. They cover many leagues a day, always at a brisk pace--the "long stride" [marcha em extensão] of the physiologists--with the muscles taut, the body erect.

224 The hunting of big game--tapir, capybara, the Rondon Commission's horses and donkeys--is carried out in groups. For certain species they use special arrows that will be described later.

227 In fishing they do not use fishhooks, but special arrows. (1)

The Tagnani also use a kind of fish trap.

1. According to Ehrenreich the hook is not habitually used by the Indians because of the piranha fish (Pygocentrus sp.) which are so voracious that they do not allow the fisherman to gather in his catch. Nevertheless, a hook made of thorn--the so-called pindá dos tupis [Tupian fishhook]--is found in many areas.

Anunze women.

Tawite camp at Tres Buritis.

542 treated with great affection. The men are jealous of their wives, and
[837] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paressi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uétü!" (son).

883 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urutau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own atiçú and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[771] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunze threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--the Cocozu in circular pits, the Tagnani in elongated graves.

585 The union of the husband and wife is pronounced by the chief who places in the mouth of each a large piece of fish. (1)

831

1. It has already been suggested (Kunike, "Der Fisch als Fruchtbarkeitssymbol bei den Waldindianern Südamerikas, Anthropos, VII 1912, p. 206-229) that the fish could be a sexual symbol among the South American Indians. Tastevin has vigorously criticized this hypothesis (Le poisson symbole de Fécondité ou de Fertilité chez les Indiens de l'Amérique du Sud, id., IX, 1914, p. 405-417). However, the Nambikwara ritual of marriage seems to confirm the first theory. Moreover, fish is directly treated as the symbol of sexual relations in the legend where Maire-Pochy makes a girl pregnant by [110] making her eat the fish which he himself had fished. As the origin of this Tupi story is certainly Andean (Kunike, loc.cit.; Métraux, p. 12-13; Ehrenreich, Ueber die Verbreitung und Wanderung der Mythen bei den Naturvölkern Südamerikas, Congrès international des Américanistes, Stuttgart, 1904, p. 663) we have there a supplementary piece of information concerning the affinity of the Nambikwara with the cultures of the North and West.

881 [110] There is no puberty ceremony for the boys. This is replaced by a ritual of initiation which takes place toward the ninth or tenth year, apparently. It is composed of two essential operations, [553 the giving of a name, and the piercing of the lip and of the nasal ● 304] septum to place some wood ornaments there. The first operation is done directly by the chief, the second by a companion whom he designates to this effect:

50. uetnoãdige iochãdige uilikade uelikãdelikinere nukeaiore judotige iurosenie nikama iurojotige (b1)
When the boy is grown the chief, the chief gives him a name. A companion pierces his lip to put in the ornament. He [the chief] orders the hole [for the ornament] to be made.

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads.

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet.

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being pressaged by its appearance the following day.

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts.

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony.

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony.

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance.

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it.

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups.

ORNAMENTATION

301 The Eastern Nambicuara also make a wide
306 assortment of ornaments from tucum nuts, shell, teeth, and bamboo. From the shell of the tucum nut they make black washers which are strung for necklaces or ear ornaments. The irregular-shaped washers are first ground down to an almost paper-like thinness on a piece of sandstone. They are then strung tightly on a string and the maker begins to rub them against a stone in order to make them circular. He continues rubbing until the washers are no more than a quarter of an inch in diameter, for the smaller the washer the more highly the necklace is valued, as this process takes many weeks.

301 The ear lobes of both men and women are per-
● 304 forated so that tucum shell washers, beads on a string, and triangular pieces of shell can be suspended from them.

The septum of the nose and the upper lips of men are perforated. Through the hole in the septum they force a slender piece of bamboo about 2 inches in length. These adornments give a peculiar expression to the face, particularly when the man is speaking. Julio was especially proud of these ornaments and claimed that white men were just like women because they did not wear them. On special occasions a blue macaw feather about 10 inches long with a bunch of red feathers near the lower end is worn in the nose. Only shamans wear a hat made from jaguar skin.

[292 E 756]

301 The most popular necklace is made from tucum washers and is worn by men, women, and children. Short lengths of bamboo, monkey teeth, jaguar teeth and claws are also used for making necklaces for men. If very long, any necklace can be worn over one shoulder and under the arm. A special type of necklace for men is made by suspending black mutúm feathers from a string alternating with lengths of bamboo. Generally the feathers also alternate, some being long and some short. A rare but highly valued necklace is made from the shiny black horns of a large beetle.

Arm bands about an inch in width made of woven cotton are worn above the biceps by both men and women. From these, men suspend tassels of buritĺ fiber. This fiber is also worn around the wrists and ankles. Wrist bands are also made for women from the tail of the armadillo.

[p. 95(B)]

844 is buried in the camp. The child is bathed, and tiny washers made of tucum nut hull are placed [304] on its ear lobes. The washer or ring is cut on an angle so that the two points eventually press through the lobe creating a hole. As the child grows, new washers are added. After a few weeks [551] the child is given a beaded necklace, but it is not named, being known only as the child of so-and-so until puberty, when it receives a name. The Waklítisu appear to have no avoidances following the birth of a child, although the Kitánrhu are [845] said to practice a modified form of couvade. Twins are accepted with satisfaction. Illegitimate [848] children are likewise accepted and are cared for by the girl's parents until she marries. No stigma appears to be attached to an unmarried mother; however, this attitude may be a recent development. [845] Crippled or malformed babies are not [847] killed, but usually die shortly after birth.

Children are nursed until they are 2 or 3 years 853 old or until another child is born. Women in the band assist one another in nursing and taking care of the infants. If a woman should have two small infants, another woman who has lost her 854 child will nurse one of them. Small children are carried on the hip of the mother, sitting on a strap which passes over the opposite shoulder of the mother. This strap which is made from embira bark or woven cotton is about 4 inches in width. Women evidently are accustomed to carrying heavy loads, for on many occasions the tiny women were observed carrying not only their child but also a huge burden basket full of firewood. When the child gets a few teeth it begins to chew on a piece of broiled meat. One morning while Kaoro and I were debating what to do with a rat which we had caught in a box trap the night before, neither of us having the courage to put our hand in the box, one of the missionaries suggested we give it to the Nambicuara. Kaoro then carried the box over to Julio's camp and gave 853 it to one of his wives. Without any hesitation the woman put her hand in the box, pulled out 252 the rat, banged its head on the box, and threw it on the coals of her fire. After the hair had been partially singed off she pulled it out, cut off its tail with her thumb nail, and gave it to her cowife's baby, who began sucking on it as if it had been a piece of candy. Then with her thumb

[p. 103 (a)]

853 252 nail she opened the rat and threw the viscera and the rat on the coals. Within 15 minutes that rat was eaten, entrails and all, while Kaoro and I looked on in a state of horrified fascination. [862] Children thus begin by eating broiled meat and fish; pieces of sour, gritty manioc cake are given to them at a more advanced age.

PUBERTY

881 When a boy reaches the age of 14 or 15 he has his upper lip and the septum of his nose pierced [304] with a sharpened fibula of a monkey ("macaco-prego"). One man holds the boy's arms, another his head, while an older male relative performs the piercing. Small plugs of bamboo are then placed in the holes. The following night the shaman leads the band in singing and dancing. Food is prepared in large quantities and offerings are made to the ghosts who are believed to be present at the ceremony. [553] The boy is now given a name which he will keep throughout his life. If the boy's father is dead he will use his father's name. If the father is alive he will use the name of some dead member in his grandfather's generation. In this way names are passed from one generation to another. An important part of the boy's puberty ceremony is the ritual beating administered by the old men of the band. He is now permitted to take part in the singing and can be present when the sacred flutes are played in the flute hut. Although this creates an attitude of obedience to the older men, he still continues to be abusive toward the women of the band. His unmarried female cross cousins now begin to notice him and openly show their desire to go hunting with him.

The puberty ceremony for girls is much more elaborate. After a girl has her first menses her father builds a small hut in the center of the camp, in which the girl is secluded. She must remain in this hut day and night and is attended by her female relatives. [202] The chief then calls all members of the band together, even sending messengers to distant hunting parties. When the band is united the chief organizes a hunt in which all the men take part, and they must remain away from the camp until the moon is full. [251] While on the hunt they accumulate a great quantity of smoked meat. When the moon is full, the men send a messenger to the camp to whom the women give some of the

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéra, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákorê and Ouihanierê to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guaycurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoákorê, and who, as now stated, are Nhambiquára. This name of Uáikoákorê is given by the Parecí of the sub-tribes Kazinití and Uaimaré of the rivers Arinos, Sacuriú-iná, Tahura-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Cabaçal and Jauxú. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of coconut. They wear armlets, bracelets, leg ornaments and bead collars made from the fruit of the mucúba. They live by the chase, but also plant maize, yams, potatoes, mandioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atzíri and the Amuésa of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kêtêhê of the Parecí, made from pounded mandioc. The native *breu* or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Oanini and wax, and is preserved in leaves of the Malá-malá palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutúm feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 38 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malá-malá and breu. The upper disk has three orifices.

291 around the ankles. The Tagnani and Tawite wear similar bands on
184 their upper and lower limbs; theirs, however, are made of cotton, which is used occasionally by the Cocozu to manufacture articles of this sort. [Plates p. 242.] Among the Tagnani and Tawite [239], men often cover their sexual organs with the ends of the straw cord that encloses their hips. But this is not the rule. The Uaintaçu rarely wear any of those bands; and among all groups, a few of the Indians always go completely naked.

[Fig. 29]

291 The women and pubescent girls, young and old, single and married, always wear the hip cord.

[243] Some pregnant women I saw did not wear it; I believe they had freed their abdomen from this strong pressure in order to breathe more easily, or perhaps for fear that the girdle should have a pernicious influence on the foetus.

302 They always wear their hair long, hanging over the shoulders; they clip it irregularly on the forehead with a bivalve shell or a cane splinter. They liked to have us cut it with scissors.

291 They are extremely fond of the hats we wear; it seemed to me that the heat of the sun on their head distressed them greatly. They will give almost as much for a hat as for an iron axe.

301 One of the jaguar-hide helmets which are now in the [National] Museum was obtained in the village of Urutau in exchange for an old and well-worn hat of ours, in spite of the fact that those helmets are highly prized [by the Indians].

They do not normally wear hide or feather head ornaments. When they are in a festive mood, they cover themselves with crowns [diadems] that will be described later, or with jaguar-hide helmets. It is likely that they also use such ornaments for certain ceremonies, but we ascertained nothing about this.

[Fig. 32]

[240] From their ears they hang triangles of mother-of-pearl, [304] which they extract from river shells; when the hole tears, splitting the lobe in two, they do not hesitate to bore another one.

[562] The men are much vainer than the women; they adorn themselves with feather diadems, earrings, pendants and necklaces, while the women limit themselves to a few of these.

304 Only the men have pierced upper lips and nasal septa; the women, never.

Children still at the breast did not have their lip or septum perforated; but those whose first milk molars had appeared already had both areas pierced. Hence I believe that this operation is not performed until boys have reached the age of two.

301 Not until they are five or seven do they begin to insert through the lip and nose perforations some thin and distinctive plugs nearly always made of reed stems.

Their use is widespread in the Serra do Norte; I have seldom seen Indian men without those plugs.

[Fig. 35]

The lip plug rests between the median upper incisors and protrudes aggressively upward; the septum plug is thicker and shorter. Both are cut to the appropriate size by means of fire.

[241] If the plugs fall out, the wearer immediately retrieves them and sets them back in the perforations; on those few occasions when [the Indians] removed them to show us how they were fastened, they promptly replaced them as if ashamed to be deprived of their ornaments.

As a rule they wear both simultaneously. Some Indians prefer to the modest nose plug another adorned with a macaw or curassow feather.

[304] Contrary to what used to be thought, these ornaments do not seem to constitute marks of distinction or signs of hierarchy.

We saw youths of eighteen adorned with such plumes; none of the Indians accorded them the least importance.

When they wear these feathers, they forego the lip plug.

Their predilection for black beads is remarkable; they make them from the shells of small palm nuts to form multi-looped necklaces, and when we offered them an assortment of glass beads they chose the black ones at first. Yet they ended up choosing all of them... They are insatiable.

Nevertheless, their ornaments are predominantly black in color. Black bracelets; rings made with black palm nuts which they used to wear as ear pendants and which they carry now on their fingers to

513
[516] on the ground in the position known by the name "aztec"—on their knees, the legs and feet flat on their inner side and the buttocks resting on the heels. Or else they cut, polish and file beads from nut-
[306] [515] shells or sea shells, earrings or other ornaments. And if the work bores them, they pick the lice from one another, stroll around or sleep.

512 During the warmest hours the camp is silent. The inhabitants,
521 silent or asleep, enjoy the uncertain shade of the shelters. The rest of the time, the occupations are carried on with animated conversations. Nearly always gay and laughing, the Indians exchange jokes, and sometimes, with unmistakable gestures, obscene or scatological accounts which are greeted with great shouts of laughter. The work is often interrupted by mutual visits or questions; when two dogs or birds copulate, everybody stops and contemplates the operation with fascinated interest; then work is taken up again, after an exchange of commentaries about this important happening.

512 The children lounge around during a great part of the day, the girls surrendering themselves at times to the same jobs as their elders, the boys idle or fishing along a stream of water. The men remaining in camp dedicate themselves to basketwork, making arrows and musical instruments, and sometimes to performing some small domestic service. Complete accord usually reigns within the household. Toward three or four o'clock, the other men return from the hunt, the camp becomes animated, the conversation becomes livelier, groups form, different from family agglomerations. They eat yucca cakes
[262] and everything found during the day: fish, roots, wild honey, bats,
824 little animals captured, and small sweet nuts from the palm bacaiuva (Acrocomia sp.). Sometimes a child begins to cry, quickly
[855] consoled by an elder. When night falls some women, chosen daily, go to collect or cut down in the neighboring woods the store of wood
512 for the [17] night. They can be seen returning in the twilight,
313 staggering under the load which pulls the tumpline used for carrying
482 it. To unload, they crouch and lean backwards a little, letting their bundle of bamboo rest on the ground in order to disengage the tumpline from their forehead.

512 In a corner of the camp the branches are amassed and each one supplies himself in proportion to his needs. The family groups form around their respective fires which begin to glow. The evening is passed in conversation, or else in singing and dancing. Sometimes these distractions are prolonged far into the night, but in general, after some amusements of caressing and friendly fighting, the couples draw closer together, the mothers clutch their sleeping infants to them, everything becomes silent, and the cold night is

412 in her burden basket, whereas the modern axes,
415 knives, and other tools, along with his ornaments, the man carries in a similar basket, or he straps this basket on the back of a boy while he walks in front of the file carrying his bow and arrows or gun ready to shoot whatever game is met along [264] the way. Whenever they kill some animal or catch a few fish and feel hungry they stop and prepare a meal. During the dry season they are at home anywhere in their band territory, moving only when hunger spurs them on.

411 Today, of course, the Nambicuara have steel
412 axes and knives. The heavy equipment of the
177 Wakititiu band in 1940, consisted of three axes, two shotguns, and some half dozen hoes which were hidden near their permanent house. Each man had a butcher knife, but all men did not have bows and arrows. There did not appear to be any desire on the part of each man to possess these implements. So long as the band had a few of these objects everyone seemed to be satisfied. Cascudo, a widower when he arrived in Utiarity, did not possess a bow and arrow, nor a gun, nor an ax. By working for the Protestant missionaries he acquired an ax and when Marciano [439] died he inherited his bow and arrows. After a few days, however, he had given the bow and arrows to a Brazilian in exchange for a felt hat.

412 Examining the hand tools which Julio used, the following articles were found: A chisel (*kwatéva*) made by inserting a piece of steel into a wooden handle wound with twine; a small bamboo knife (*alitihwirikato*); a hardwood drill (*hiakato*), [305] used with sand for perforating tucum nut shells in making beads; a piece of sandstone (*dalipiou*), used as a whetstone; a number of rough leaves of the lixeiro tree (*kle'dnatu*), used as sandpaper; and a
415 comb (*ke'dlatu*). Each of Julio's three wives had a burden basket, a small square basket, and two or three gourd vessels of various sizes. A single wooden mortar and pestle did service for the whole band.

411 One of the most important implements of the Nambicuara is the bow, *kdlieu*, made from the pirva (*Jacaranda copaia*) or the uiriva palm (*Syagrus cyanicus*). By far the most common is the bow made from pirva, ranging between 6 and 7 feet in length, flat on the inside and convex on the outside. One of the bows examined measured 2 meters and 14 cm. in length, 4 cm. in width, and 1.5 cm. in

[p.93(4)]

411 (1) The *Ádepeu*, an arrow which is used for shooting monkeys and large birds, is made by lashing an inch-long slender barb of *siriva* palm or *piuva* about an inch back from the sharpened point of the foreshaft.

[223 224]

(2) The *saláitiu*, or fish arrow, is made by lashing four slender points of wood about 2 inches long to the end of the foreshaft. This arrow need not be feathered. Today wire is sometimes substituted for the wooden points.

[227]

(3) The *dáakiu*, or blunt bird arrow, used for shooting small birds, has a separate *piuva* foreshaft, the end of which forms a rounded flat surface about an inch in diameter.

[223]

(4) The *Ádpeiu*, or big game arrow, has a broad split bamboo point about 12 inches in length which is lashed to the foreshaft. As the bamboo point is slightly grooved along the center, the foreshaft lies along the groove permitting it to be lashed firmly to the tapered sides of the point. Formerly curare poison was smeared along the groove. This was also the arrow used in war.

[224]

Sometimes a bamboo point is serrated on one or both sides. In former times, this arrowhead was poisoned with curare. It was attached loosely to the shaft so that when it struck an animal it became detached from the shaft. This arrow was used against big game like the jaguar, tapir, deer, and against human enemies.

The bow is held in a vertical position when shooting; the arrow is held with the thumb and forefinger while the middle and ring finger pull the bowstring, with the arrow resting against the hand side of the bow.

283 Cordage is made from the fibers of the tucum and buriti palms and from cotton. The tucum palm (*Astrocaryum tucuma*), *Aaitíru*, provides not only fiber but the hard shell of the nut is used for making the black, round, flat necklace washers, and the thorns from the trunk are used as spikes in the manioc grater. Tucum twine which is a little stronger than buriti twine is used for bowstrings, for stringing beads, and for many other purposes. When a man needs tucum twine he sends his wife to gather the palm leaves. As the young trees grow in clumps, it is a simple matter for the woman to cut off a number of fronds. The woman then takes a long slender leaf, bends it double in the middle so that the woody fiber breaks, then doubles it back and pulls downward

SP17 Nambicuara SP17

ORNAMENTATION

301 The Eastern Nambicuara also make a wide
•306 assortment of ornaments from tucum nuts, shell, teeth, and bamboo. From the shell of the tucum nut they make black washers which are strung for necklaces or ear ornaments. The irregular-shaped washers are first ground down to an almost paper-like thinness on a piece of sandstone. They are then strung tightly on a string and the maker begins to rub them against a stone in order to make them circular. He continues rubbing until the washers are no more than a quarter of an inch in diameter, for the smaller the washer the more highly the necklace is valued, as this process takes many weeks.

301 The ear lobes of both men and women are per-
304 forated so that tucum shell washers, beads on a string, and triangular pieces of shell can be suspended from them.

The septum of the nose and the upper lips of men are perforated. Through the hole in the septum they force a slender piece of bamboo about 2 inches in length. These adornments give a peculiar expression to the face, particularly when the man is speaking. Julio was especially proud of these ornaments and claimed that white men were just like women because they did not wear them. On special occasions a blue macaw feather [292] about 10 inches long with a bunch of red feathers [156] near the lower end is worn in the nose. Only shamans wear a hat made from jaguar skin.

301 The most popular necklace is made from tucum washers and is worn by men, women, and children. Short lengths of bamboo, monkey teeth, jaguar teeth and claws are also used for making necklaces for men. If very long, any necklace can be worn over one shoulder and under the arm. A special type of necklace for men is made by suspending black mutúm feathers from a string alternating with lengths of bamboo. Generally the feathers also alternate, some being long and some short. A rare but highly valued necklace is made from the shiny black horns of a large beetle.

Arm bands about an inch in width made of woven cotton are worn above the biceps by both men and women. From these, men suspend tassels of buriti fiber. This fiber is also worn around the wrists and ankles. Wrist bands are also made for women from the tail of the armadillo.

[p. 95(B)]

132
134 The soil here is sandy and the rainfall insufficient
to support a forest. The vegetation consisted of
136 stunted piqui, mangabeira, fruta de lobo, lixeiro,
137 and other gnarled cerrado trees with the surface
sparcely covered with bunches of wiry grass and
other drought-resistant plants. During the whole
day we saw only four deer and two rheas, which
gives some idea of the poverty of the area. This
000 is public domain and apparently unwanted by
stockmen owing to its poor soil and lack of water.
By now we had left the telegraph line, which
crosses unbridged rivers, and were winding around
the headwaters of the streams. That night we
camped at Sucuruina where two palm-leaf-cov-
ered sheds, left by "tropeiros," provided some
shelter from the drizzling rain.

133 The following day the skies cleared and from the
137 tops of the folds in the plateau we obtained
magnificient views of the great plain. What few
● 312 trees could be seen were no more than 5 or 6 feet
high. A curious phenomena seen along the plateau
are the patches of forest of 5 to 10 acres in extent
which appear to grow straight out of the semi-
desert. Evidently ground water comes near the
surface in these spots, permitting the growth of a
genuine forest. Another interesting sight was the
birth of rivers. In the shallow valleys formed by
the folds, one could first see swampy ground, then
tall grass, then bushes, then short trees, and
finally the tall trees forming a "galeria" forest
which bordered a river winding its way northward
to form one of the headwaters of the Amazon
system.

At 4 o'clock we arrived at the Sacre River where
the trucks had to be ferried across on a raft.
As this operation took until dark we camped for
the night in some vacant buildings left by rubber
workers. Before leaving next morning we visited
the waterfall (Salto Bello) about 200 yards below
the ferry where the Sacre River tumbles over a
sheer drop of about 180 feet. Early in the after-
noon we reached the Papagaio River and after
ferrying the trucks across we were in Utiarity.
Both the Sacre and the Papagaio are deep clear
streams about 100 yards in width at the ferry
crossings. These headwater streams are evidently
fed by underground water, for their level does not
vary appreciably during the year.

000 Utiarity, which was to be our base camp for the
remainder of June and for July, is built on an

Sometimes these distractions are prolonged far into the night, but in general, after some amusements of caressing and friendly fighting, the couples draw closer together, the mothers clutch their sleeping infants to them, everything becomes silent, and the cold night is

The Waklĭtisu do not
323 make pottery, but they sometimes acquire pots from the Paresí in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Waklĭtisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[482 and carrying a burden basket on her back and a
854] baby strapped on her hip, an older child following
222 her. As they move slowly along they collect fruits, nuts, insects, snakes, ants, lizards, rats, wild honey, and a great variety of grubs or larvae.
226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262] These were later thrown on hot coals and eaten
223 without being cleaned. Small birds no larger
222 than a sparrow are shot if the man can get near enough to use his bow and arrow. If they come
[314] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
●313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally stalked by a single hunter, particularly if he has
[177] a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

226 Xingú, the Nambicuara timbó fishing appears very elementary. The small fish are wrapped in [252] leaves and placed in hot ashes until cooked. Large fish are broiled on a babracot. The Nambicuara also claim that they fish at night with [177] torches along the river banks. This method may have been taken over from the Brazilians.

AGRICULTURE

241 The principal food crops grown by the Nambicuara are bitter manioc, sweetpotatoes, arrowroot, cará, maize, beans, and peanuts. To this list we must add such nonfood crops as cotton, tobacco, urucú, and gourds. The scientific and native names of these plants are listed in Appendix 1.[1] In more recent times they are known to produce sweet manioc and sugarcane. The dependence upon food crops in relation to game, fish, and wild food plants is difficult to gage. The statements of missionaries, however, appear to indicate that cultivated crops do not provide a year-round food supply and may actually play a minor role as compared with dependence upon noncultivated resources.

Farming is done on the slopes of the "galeria" forests, where, as we have seen, they also do most of their hunting and collecting. The Waklítisu band clears and cultivates a single field and, as we have said, lives in a single house while thus occupied. In the past the field (*haítsu*) was [177] cleared with a stone ax (*stúneu*) and a wooden club (*hukwéniu*). Today steel axes and machetes are used, but the method of planting is still the same. The efficiency of steel tools over stone axes and wooden clubs is indicated by the statement that in the past when a new field had to be cleared the people had to work during most of the wet season in order to fell the trees, a task which they now perform in May and June.

Formerly the light undergrowth was pulled out by hand and the bushes and saplings were beaten down with the wooden club. The Nambicuara 241 had a unique way of felling trees. Starting near • 313 the bottom of the slope, they cut all the small trees part way through, then selected a number of large trees as kingpins. When these large trees were felled they knocked down the smaller trees below them. This was continued until they had a circular clearing of the required size on the slope. 241 Today the clearing is done with axes and knives,

[1] [Cat. 116, pp. 124-126.—Ed.] [p. 90 (B)]

com a dois. As cestas de carga têm grande capacidade e são feitas de taquára. Os seus laços são fixados no fundo e nas paredes laterаes, passando pelas axilas e pelas espaduas de la india portadora.

Os Nhambiquára fazem ceramica de uma pasta grosseira, negra e mal cozida, na qual se acha a arjila misturada á grande porção de cinzas (Fig. 2).

[323]

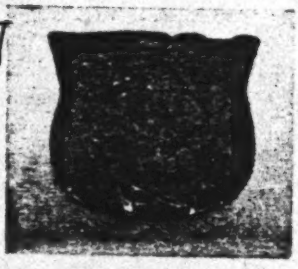

FIG. 2.—CERAMICA DOS NHAMBIQUÁRA.
[Nambicuara pottery]

Para derrubar as arvores do terreno destinado á cultura, uzam do machado de pedra (diabaze) fixado em um cabo de madeira, por meio de cordeis e breu (Fig. 3). O indio que consegue deitar abaixo certas arvores com este instrumento, recebe como premio uma bella pena de arara ou mutum (*Crax globulosa*), que se destina ao nariz. Esta especie de condecoração conferida por trabalho industrial é tanto, mais notavel quanto, em geral, taes distincções, entre os selvagens do Brazil, são reservadas ao merito guerreiro.

Os arcos geralmente muito grandes, muito fortes, de madeira vermelha, são muito bem alizados. A sua secção transversal é semi-cilindrica. Seu comprimento varia, nos que existem na coleção, entre 1 m. 80, e 2 m. 38. Para obter uma flexa de 50 c. entre a corda e o arco de 2 m. 38, em experiencia feita, precizámos uma força de tração correspondente á 60 k. verificados no dinamometro. A corda é de tucum (*Astrocarium tucum*), e tem um diametro de 2 mm.

[313 442]

FIG. 3.—MACHADO DE PEDRA (DIABAZE) PARA DERRUBAR ARVORES.
[Stone axe for felling trees]

As flechas destes indios têm aspétos diferentes e pódemser caracterizadas pela fórma das pontas, segundo 5 tipos (Fig. 4).

O primeiro tipo tem a ponta de madeira vermelha, inteiramente liza e cilindrica (Fig. 4, *e*); o segundo se caracteriza por um pequeno aculeo fixado á ponta, dando-lhe a fórma de harpão (Fig. 4, *b*); tem a ponta de taquára em fórma de punhal com cerca de 25 c. de comprimento, as flechas do terceiro tipo (Fig. 4, *af*); as do quarto tipo distinguem-se mui facilmente por ter a ponta achatada, e provida, lateralmente, de 11 pares de farpas. As mais curiosas das flechas dos Nhambiquára são as do quinto tipo (Fig. 4, *ai*). Sua ponta tem farpas fixadas por meio de fios de

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life.

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard.

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton.

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string.

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the *"Arawak"* type (pl. 37, *center, right*).

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour.

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark.

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood.

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

The Wakl'tisu do not
323 make pottery, but they sometimes acquire pots from the Paresí in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakl'tisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[482 and carrying a burden basket on her back and a
854] baby strapped on her hip, an older child following her. As they move slowly along they collect
222 fruits, nuts, insects, snakes, ants, lizards, rats, wild honey, and a great variety of grubs or larvae.
226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262] These were later thrown on hot coals and eaten
223 without being cleaned. Small birds no larger
222 than a sparrow are shot if the man can get near enough to use his bow and arrow. If they come
● [314] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally stalked by a single hunter, particularly if he has
[177] a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

baked manioc and other food which they have been preparing. When the messenger leaves with the food it is a sign that the men will return to camp after sunset.

Before the men arrive the women wash the girl and paint her with a mixture which includes latex from the rubber tree. A series of dots are painted on her face, breasts, abdomen, and thighs (pl. 6, *c* and *d*). When the men come in they dance in front of the girl's hut. She then comes out and is given a name and everyone tries to give her a necklace or some other object. During the night men and women join in the dance, holding hands and dancing in a circle, the dance steps being stamped out with the right foot in the direction in which the circle is moving. A special puberty song is also sung.

The Nambicuara tell of a strange medicine known only to the shamans which is given to girls during the puberty ceremony. It is a blue liquid which, when taken internally, stops menstrual bleeding for the remainder of the girl's life. The Wakĺtisu claim that they do not use it but that the other Eastern Nambicuara band do. The missionaries informed me that the Kitánrhu use this medicine, and the missionaries seemed to think that it was effective.

MARRIAGE

There is no special marriage ceremony, for when young people go through the puberty rites they are ready for marriage and a mate is selected for them by their parents. The young man, who is to become the husband of a girl just out of seclusion, goes to her parents and helps his future father-in-law build a small hut, and when it is finished the young man tells the girl to come out hunting with him. She takes a burden basket and they go off into the woods. In the afternoon the man builds a fire and tells the girl to prepare some food and honey. After the food has been eaten he tells the girl to come and lie beside him near the fire. She is supposed to resist and he takes a stick and threatens her. He then has sexual intercourse with her, and when they come back to camp that night they are accepted as a married couple. When wives are acquired by inheriting the widow of a brother or by abduction from other bands, no ceremony is held.

000 old Paressí Indian village site on the west bank of the Papagaio. It is a division point in the telegraph line, and besides the telegraph operator there is a section boss and a number of Paressí Indian linemen. As the Nambicuara take whatever wire they feel they need, the linemen are kept busy repairing the line. There are 12 houses in the settlement proper with the buildings of the Protestant Mission forming one end of the town and the buildings of the Jesuit Mission forming the other.

● [316]

The line boss, who is also the mayor of the town, gave Kaoro and me a two-room mud-and-wattle house as our quarters. Our meals we took with the two American missionary families. The Catholic Mission was under the charge of Father Roberto, a Frenchman, and Father João, an Austrian. In addition, there were three sisters in charge of a school. The priests had developed extensive fields of manioc and rice, irrigating the fields by diverting water from the river. They had also set up an electric-light plant, using water as a source of power. There are tremendous possibilities for power development, for Utiarity Falls, situated some half a mile distant, has a drop of about 240 feet. Unfortunately this power resource is located in a practically uninhabited, semiarid region.

797 484 The Rev. L. W. Buckman, who has been in the area since 1941, kindly consented to prepare a pack train, using the mission oxen and mules, to go in search of the nearest band of Nambicuara. On the third day after our arrival when our preparations were well along, however, a band of Nambicuara came to Utiarity. In fact they were able to get a ride on João Tapuya's trucks as he was returning from Burity, the end of the truck road. This was Julio's band of some 18 people known by the Nambicuara as the Waklítisu. Their purpose was to bring one of their men who had running syphilis sores to the Jesuit Mission for treatment. This changed our plans, for we now had one of the four Eastern Nambiucara bands in camp, which would give us plenty to do for the limited period of our visit. Also during the first 000 week, Father João returned from the Iranxe village, bringing five men, and offered to assist us in gathering whatever information we could get from them. This we found to be very difficult, as the Iranxe spoke no Portuguese and the mis-

THE PEOPLE AND THEIR HABITAT

The telegraph line which runs from Cuiabá, the capital of Mato Grosso, to Porto Velho on the Madeira River has created a narrow corridor of the known through the vast unknown stretches of northwestern Mato Grosso. Along this line the Government has established telegraph stations manned by telegraph operators, many of whom are Paresí Indians. A makeshift road, over which trucks can travel, follows the line a few miles past Utiarity to Burity; beyond this the road is no more than a trail along which men ride on horseback and goods are transported by pack oxen. At Vilhena there is an army airfield.

Since 1912, when the line was completed, this corridor has been the highway of men who have sought rubber, diamonds, gold, and Indian souls. No permanent settlements of farmers or stockmen, as yet, occupy this vast hinterland. The rubber concessioner, usually a man from Rio de Janeiro, São Paulo, or Cuiabá with sufficient funds to buy a truck or two, lays claim to a stretch of "galeria" forest, builds a camp along the road, hires a number of tappers, and goes into business. Each underpaid tapper works an area of trees, bringing his rubber to camp on his back or more rarely on oxback. Food must be brought in from Cuiabá, and as supplies, at best, are precarious, any delay in truck transportation brings scurvy and starvation. Eventually the workers drift away, some it is said dying on the way, and the operation ceases. During the last war the United States Government, through the Rubber Reserve, enabled rubber operations to expand. Good camps were established and the road improved. Today, however, the camps and the road are deteriorating, leaving the field to the shoe-string operator with his second-hand truck. The operations of the gold and diamond miners are still more uncertain. In small groups they enter the area, their scanty supplies carried on oxen and mules. Men unfamiliar with the semiarid wastes easily miss the areas where fodder and water can be obtained, the pack animals die and the stranded men are left to find their way out the best they can. At Utiarity I met a miner who was waiting for food supplies from Cuiabá. He had four oxen and two

[p. 82(B)]

carry water. Pottery, unknown to the eastern groups, is crude everywhere else. There are neither canoes nor dugouts. The Indians make five different types of musical instruments, all winds, which are often heard in festivals.

The difference in physical appearance between the Nambikwara and their eastern, western and southern neighbors—Paressi, Tupi-Kawahib and the tribes of the Guaporé—is striking. (2) And they

2. The anthropological study of the Nambikwara was the object of research of Dr. J.-A. Vellard, who was part of our expedition.

also differ from most of the other tribes of Brazil, whose physical type is generally more massive than theirs. In the case of the Nambikwara, the body is not exceptionally small; but they are slim, and their long hair, sometimes wavy and of more developed pilosity than the indigenous median, their hands and feet of reduced dimensions, their fine lineaments, and above all their faces, of characteristic outline but very purely chiseled, contribute to form a physical type far removed from that encountered most often in South America, but which reminds one persistently of certain types of southern Mexico and Guatemala, and even more of that characterized by the masks with pointed beards of the region of Vera Cruz.

* * * * *

The Nambikwara get up at dawn, stir up the fires, warm themselves as well as they can after the cold of the night, then they eat lightly of the [16] remains of last evening's yucca cakes. A little later the men leave, together or separately, for a hunting expedition. The women remain in the camp where they devote themselves to culinary duties. The first bath is taken when the sun begins to come up. The women and children often bathe together for amusement, and sometimes a fire is lighted before which they crouch to warm themselves on coming out of the water while they playfully exaggerate a natural shivering. Other bathing takes place during the day. The daily occupations vary little. The preparation of food is that which requires the most care and time. Yucca must be ground and pressed, and the pulp dried and cooked. Or else the cumaru nuts (Dipteryx odorata) which add their perfume to most dishes must be shelled and boiled. When the need is felt, women and children go out on foraging expeditions. If the provisions are sufficient, the women spin, crouched

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life.

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard.

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton.

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string.

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Aruaak*" type (pl. 37, *center, right*).

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour.

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark.

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood.

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

ties down to their smallest details. There is, undoubtedly, a function in chieftainship. This can, however, be reached only through analysis as the underlying principle of the institution. In other words, the differing structure of the digestive organs in man, ox, fish and clam do not point toward different functions of the digestive system. The function is always and everywhere the same, and can be better studied, and more fully understood where it exists under a simple form—for instance, in a mollusc. Similarly, and as Professor Lowie once wrote, if anthropology is to be considered as a scientific study, its subject matter cannot be individual cultures, but culture taken as a whole; the rôle of individual cultures being to offer, according to their own characteristics, special angles from which the basic functions of culture, although universal in application, can be more easily reached.

This will perhaps help us to eliminate preliminary questions which otherwise could have proved very difficult. Anthropologists in South America and elsewhere have been eagerly debating the question of whether these South American tribes—nomadic, relying mostly on collecting and gathering, with little or no agriculture, little or no pottery, and, in some cases, with no dwelling other than crude shelters—should be considered as truly primitive and as having preserved their exceptionally low cultural level through tarriance, or whether they did not previously possess a higher type of social and material organization and have regressed to a pseudo-archaism under unfavorable circumstances. The Nambikuara are one of those tribes which, along with the Siriono, on the other side of the Guaporé valley, the Cayapo, Bororo, Karaja of central Brazil, the so-called *Gé* of Central and Eastern Brazil, and some others, together form a kernel of primitiveness surrounded, in the West, by the higher tribes of the upper Amazon, the Bolivian plain and the Chaco, and from the Oronoco's to the La Plata's estuaries, by a coastal strip inhabited mostly by the Arawak, Carib and Tupi-Guarani linguistic families. An independent linguistic stock divided into several dialects, the Nambikuara seem to display one of the more backward cultures in South America. At least, some of their bands do not build huts and are wholly ignorant of pottery and, even among the others, these two arts are exceedingly poor. There is no weaving, except for the narrow arm and leg bands which are made of cotton; no dress whatsoever, either for the men or for the women; no sleeping contrivances, such as hammocks or platforms; the natives being used to sleeping on the bare ground without the protection of blankets, mats or hides.

The Wakítisu do not
323 make pottery, but they sometimes acquire pots from the Paressí in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakítisu band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[482 and carrying a burden basket on her back and a
854] baby strapped on her hip, an older child following
222 her. As they move slowly along they collect fruits, nuts, insects, snakes, ants, lizards, rats,
226 wild honey, and a great variety of grubs or larvae. When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262] These were later thrown on hot coals and eaten
223 without being cleaned. Small birds no larger
222 than a sparrow are shot if the man can get near enough to use his bow and arrow. If they come
[314] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

cos a dois. As cestas de carga têm grande capacidade e são feitas de taquára. Os seus laços são fixados no fundo e nas paredes lateraes, passando pelas axilas e pelas espaduas de la india portadora.

Os Nhambiquára fazem ceramica de uma pasta grosseira, negra e mal cozida, na qual se acha a arjila misturada á grande porção de cinzas (Fig. 2).

[323]

FIG. 2.—CERAMICA DOS NHAMBIQUÁRA.
[Nambicuara pottery]

Para derrubar as arvores do terreno destinado á cultura, uzam do machado de pedra (diabaze) fixado em um cabo de madeira, por meio de cordeis e breu (Fig. 3). O indio que consegue deitar abaixo certas arvores com este instrumento, recebe como premio uma bella pena de arara ou mutum (*Crax globulosa*), que se destina ao nariz. Esta especie de condecoração conferida por trabalho industrial é tanto, mais notavel quanto, em geral, taes distinçoes, entre os selvagens do Brazil, são reservadas ao merito guerreiro.

Os arcos geralmente muito grandes, muito fortes, de madeira vermelha, são muito bem alizados. A sua secção transversal é semi-cilindrica. Seu comprimento varia, nos que existem na coleção, entre 1 m. 80, e 2 m. 38. Para obter uma flexa de 50 c. entre a corda e o arco de 2 m. 38, em experiencia feita, precizámos uma força de tração correspondente á 60 k. verificados no dinamometro. A corda é de tucum (*Astrocarium tucum*), e tem um diametro de 2 mm.

[313
412]

FIG. 3.—MACHADO DE PEDRA (DIABAZE) PARA DERRUBAR ARVORES.
[stone axe for felling trees]

As flechas destes indios têm aspétos diferentes e pódemser caracterizadas pela fórma das pontas, segundo 5 tipos (Fig. 4).

O primeiro tipo tem a ponta de madeira vermelha, inteiramente liza e cilindrica (Fig. 4, *e*); o segundo se caracteriza por um pequeno aculeo fixado á ponta, dando-lhe a fórma de harpão (Fig. 4, *b*); tem a ponta de taquára em fórma de punhal com cerca de 25 c. de comprimento, as flechas do terceiro tipo (Fig. 4, *af*); as do quarto tipo distinguem-se mui facilmente por ter a ponta achatada, e provida, lateralmente, de 11 pares de farpas. As mais curiosas das flechas dos Nhambiquára são as do quinto tipo (Fig. 4, *cd*). Sua ponta tem farpas fixadas por meio de fios de

411
278

experiment with the resinous, supposedly poisonous substance found on the tip of one of these arrows. He injected a concentrated solution of it into frogs and guinea pigs, and the only resulting symptoms were muscular twitchings, unsteady gait, and some salivation.]

[Fig. 60]

411 Aieraçũ: The tip is blunt; it is used to stun birds that are to be caught alive or free from blood, which stains the feathers. [See fig. ... (59), p.55A] Often a smooth tip wrapped in a straw pellet is used for the same purpose.

[227] [274] Some unique fishing arrows have a double, triple or quadruple tip and a bone barb. [See fig. ... (37), p. 36B.] Some have feathers at the base, others do not. . . . .

All Serra do Norte arrows have shafts made of thin bamboo. The various parts of the weapon are secured with strips of the strong [824] imbé liana (Philodendron imbe, Mart.).

[Fig. 61] The clubs are extremely crude weapons of attack and defense, mere portions of thick branches cut when the occasion demands it.

● [324] [275] The axes of chipped stone are uniform in type. They are wedge-shaped, made of diorite, and they average two kilograms in weight. The handle is a piece of creeper stem, perhaps from a Bauhinia. The pitch and cord used to fasten the stone make the tool surprisingly strong. . . . .

381 [824] The pitch is made of mastic resin, jatai (Hymenea stigonocarpa or H. stilbocarpa), and wax, as well as other unknown substances. It is placed in pots and subjected to the action of fire, then kept in pellets fastened to embira strips or in loaves wrapped in leaves. Both the arrow "poison" and the axe pitch are called by the name of dukutaarũ, which means "wax."

[Fig. 62]

361 [226] We do not know yet what determines these shifts to nearby locations; they may perhaps be caused by the death of an
[768] Indian or by some communal misfortune. The distances involved are so small that the moves could not possibly derive from any significant ecological changes.

342 In order to keep rain water from seeping underneath the thatch, the Tagnani and Tawite Indians cover the inner ground perimeter of their conical huts with a series of overlapping plates made of jatobá shells.

The rain does not leak in.

354 It would not be fair to imagine the interior of the huts as hot and stuffy; air penetrates freely in between the leaves.

Nevertheless, the situation changes when the Indians light their small fires. Happily for them, the thatch is sufficiently permeable to keep their eyes free from the grave diseases often encountered among primitive peoples whose dwellings are smoky.

352 Household furnishings are rudimentary; except for the grids mentioned above and a few large pots, nothing else might properly be termed a piece of furniture. All other objects are tools, artifacts,
[484] weapons and ornaments [227] [plates p. 222] which they carry with them on every journey, no matter how brief. Only the heavier mortars and graters, which cannot be carried easily, are left in the hut. These barbarians in turn could say: "Omnia mea mecum porto" [everything that is mine I carry with me].

Straw pallets, cured hides, hammocks, sleeping platforms, cots and true beds represent types of bedding characteristic of different stages of civilization.

513 The use of pallets already indicates a certain degree of advancement; but the Nambicuara have no bed other than the earth. They sleep on the bare ground.

They did not possess the hammock, that inseparable companion of their neighbors the Paressi; now that they are acquainted with it, they hold it in high regard. It was difficult to obtain any rest among them during the night; no sooner had we set up our hammock than three or four candidates would appear... And once they had taken over, it was hard to get it back. We were frequently awakened by Indians who forcibly asserted their desire to sleep in the hammocks we occupied.

593 The conversation becomes animated and laughter spreads. In the dark
182 prairie the camp fires burn. Around the fire, the only protection
462 against the cold which descends, behind the frail windbreak of palms
● [342] and branches hastily planted in the ground on the side where wind or
[415] rain is expected; near the baskets filled with poor objects which constitute their whole earthly treasure; lying on the ground which extends around, haunted only by other bands equally hostile and fearful, the couples, embracing tightly, are truly seen as the support of one another, the comfort, the only help against the daily difficulties and the dreamy melancholy invades the Nambikwara soul from time to time. The visitor who camps in the brush with the Indians for the first time feels tenderness as well as anguish and pity before the spectacle of this humanity so completely unprotected; crushed, apparently against the soil of a hostile land by some implacable cataclysm; naked, shivering around the hesitant fires. He circulates tip-toe among the underbrush, in the dark, avoiding crushing in his walk a hand, an arm, a trunk, whose warm reflections are seen by the light of the fires. But this misery is animated by whispering and laughter. [56] The couples clasp one another as in the nostalgia of a lost union. Their caresses, at the same time tender and candid, are not interrupted by the passage of the stranger. One senses in all
[157] of them an immense gentleness, a profound carelessness, a naive and charming animal satisfaction, and, emanating from all that, something like the most moving and credible expression of human tenderness.

593 Thus it is not surprising that the attitude of the two sexes as con-
831 cerns one another is characterized by intense interest. This interest
462 is translated in certain cases by the vocabulary. In fact the Nambikwara
562 have only one word to express "pretty" and "young," and a single word to
[517] signify "ugly" and "old" (munjene, jeʔene, bl). Their esthetic judgments are thus based essentially on human considerations, and above all, sexual ones. But the interest which is manifested between the sexes is of a complex nature. Men judge women in a mass, as being a little different from themselves. Depending on the situation, they consider them with desire, admiration, or tenderness. In itself the confusion of terms pointed out above constitutes permanent homage. But it must not be forgotten that the form of economic adaptation realized by sexual division of labor a capital role attributes to the women, since family life rests to a very large degree (probably the greatest) on the collecting of the women, but it represents an
[83] inferior type of activity. The ideal life is conceived on the model of agricultural production or hunting. To have plenty of manioc, and

857 iõndage ʔutẽnturu kajãno kajãn kajãn hõte kajãnde ʔutentere kuajkano (b1).

When I am big, I shall catch the caetetu, caetetu, caetetu, the monkey, the caetetus, I shall kill them when it (the dog) barks.

[368] She makes an error in grammar which the father points out
857 laughingly: she should have said tilõdage, "when I am big,"
154 instead of the masculine form she used. The error is interesting, placed in context, which manifestly shows a feminine desire to raise the economic activities reserved for that sex to the level of those which are the men's privilege. As the exact sense of ʔutẽntere is "to kill by beating with a stick or club" (here, the digging stick), the informant tries unconsciously to identify [71] feminine collecting and gathering (which can only aim at the capture of small animals) with the masculine hunt, armed with bow and arrows.

593 The relationships between brothers and sisters have not given rise to any particular observation. In the central and southern group, one finds a special expression to designate the brother of the same sex, nlaõre, "the other one"; this term is not only applied to kinship relations, but also designates objects be-
[342] longing to the same type. Thus the five or six poles planted obliquely which fan out from the center, and which hold up the first skeleton of the hut, are called indelẽaore; likewise, the
[534] double (kalõde) or triple (lutandione) pipes or whistles. Friendly
857 groups are said to be "brothers" (1) also, and in discussions

1. See p. 92.

between adversaries they use the exclamation:

17. kakõtjane tãkanããtjane (b1).

Wicked one! You are no longer my brother!

[192] which indicates that among the Nambikwara the term "brother" has the same wide sense which it possesses in our vocabulary.
857 But in the heart of the infantile society, numerous attitudes take
182 form which prepare or advance later relationships. The orphan baby a9 spends nearly the whole day in the hands of her young sister a8 (one is 2 to 3 years old, the other 6 to 7). Her sister takes care of her, carries her, feeds her. a19 and a20 (who are "mothers") act like elders toward these two children, in a way more marked than the real difference in age calls for. In fact, a8 and a20 are contemporaries. The eldest, a19, cracks bacaiuva

SP17 Nambicuara SP17

When rains come, the *Nambicuara* settle in temporary villages, and the men open circular gardens in the gallery forest by burning and felling the trees with stone (now steel) axes. They till the soil with pointed sticks and raise both bitter and sweet manioc, several kinds of maize which are different from those of their more civilized neighbors (Roquette-Pinto, 1938, p. 297 n.), beans, gourds, cotton, urucú, and a variety of small tobacco with tiny leaves. Despite the difficulty of fishing in the deep, clear tributaries of the Juruena River, they have moderate success using fish arrows, basket traps, and a drug made of a vine.

Food preparation.—Game is usually only half cooked in hot ashes, but it is sometimes smoked on rectangular or pyramidal babracots. Manioc is grated on thorns of the catizal palm (*Iriartea* sp.) imbedded in palm wood plants. To remove the poisonous juice of bitter manioc, the pulp is either squeezed in a strip of bark twisted spirally or buried for several days to allow the juice to drain off. Balls of the pulp are then sun-dried and packed in leaves in baskets or buried at marked places. In times of scarcity, perhaps months later, the half-rotten balls are made into flat cakes, hastily cooked in hot ashes, and eaten.

The *Nambicuara* cannot bear to eat salt, which they do not know how to prepare, or pepper, which they do not cultivate. Even hot food is cooled with water before it is eaten. Wild honey, too, is diluted with water. The only condiment is a variety of cumarú bean which has a strong, bitter almond taste. It is boiled in pots; afterward the liquid is drunk and the beans are mixed with food, especially with grasshoppers crushed in mortars. Armadillo meat is often ground with maize flour.

Domestic animals and pets.—The *Nambicuara* have many pets, especially monkeys, coatis, parrots, and birds. Domesticated animals were unknown until the Rondón Commission introduced chickens and dogs. Although at first extremely afraid of dogs, the Indians quickly adopted them and treated them with the same deep affection they show all their tame animals. Even now they are terrified by oxen seen at telegraph stations, and call them by the name given to the deadly spirits of the water and the bush. They do, however, hunt and eat horses and mules as if they were wild game.

HOUSES

The surprising variety of house types suggests recent borrowing from neighboring tribes. The *Nambicuara*, like the *Sirionó*, may formerly have lacked houses entirely. During most of the year, even at the present time, they build only scanty temporary shelters for a single night. These consist of branches of palms stuck into holes dug in the sand to form a half or quarter circle on the side from which the sun, the wind, or rain are expected (pl. 37, *center, left*). Each individual family builds its own

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

342 [361] shelter and lights its own fire in the opening. During the rainy season, villages consisting of one or more beehive huts are built on slight hillocks above the course of a secondary stream. Some of the *Eastern Nambicuara* build only shelters, although larger and stronger than the ones described. The beehive hut is very light, each about 10 to 20 feet (3 to 6 m.) in diameter. The frame consists of several long, supple poles, bent so that both ends can be stuck into the ground and tied together at the top, where they cross. Circular branches running horizontally are tied to the poles at different levels. The *Central* and *Western Nambicuara* have a more elaborate hut (pl. 37, *top*) whose perimeter is about 50 feet (15 m.). It has a central post from the base of which several forked poles run obliquely to support the bent poles of the external frame. All types of huts are thatched with horizontal layers of palm leaves, those of *Central* and *Western Nambicuara* exactly like the houses of their southern neighbors, the *Kepikiriwat*.

A gabled house without walls was also observed by Roquette-Pinto, who recorded other kinds of temporary huts. Some were built by sticking two branches into the ground, bending them over and attaching them to a horizontal pole tied to two perpendicular posts and covering them with bunches of grass.

352 513 The *Nambicuara*, although all their neighbors use hammocks, sleep on bare ground or on flat pieces of bark from the paxiuba palm. Because of this custom, the *Paressí* nicknamed them *Uaikoakôre*, "Those Who Sleep on the Ground."

CLOTHING AND ADORNMENT

[291] 301 Both sexes are naked, except that men sometimes tie a small tuft of buruty straw to their belt to cover the sex organs. Both men and women wear a thin, cotton-thread belt strung with white or black beads cut from river mollusk shells or from tucumã palm nuts. Such beads, with larger triangular pieces of mollusk shells, are also used for necklaces, earrings, bracelets, and other ornaments. Men wear grass or reed pins through their upper and lower lips; and, through their nasal septum, a larger pin made of a jacu (*Penelope*) feather mounted on a stalk covered with plaited cotton thread and porcupine quills and trimmed with a red toucan feather ring. Both sexes wear armlets and anklets of woven cotton, burity straw, feathers, parts of dried birds, fur, or mollusk or crawfish shells. Women wear one or more bracelets cut from the tail of the great armadillo and double bandoleers of plaited cotton dyed with urucú and decorated with porcupine quills. Hair ornaments are confined to men: circlets of plaited straw, of straw and and toucan feathers, or of fur with feather pendants. War dress consists of a jaguar-skin bonnet (pl. 36, [714] *top, left*) with a long, plaited buriti-straw tail painted with red stripes And dots hanging down from the nape of the neck.

ties down to their smallest details. There is, undoubtedly, a function in chieftainship. This can, however, be reached only through analysis as the underlying principle of the institution. In other words, the differing structure of the digestive organs in man, ox, fish and clam do not point toward different functions of the digestive system. The function is always and everywhere the same, and can be better studied, and more fully understood where it exists under a simple form—for instance, in a mollusc. Similarly, and as Professor Lowie once wrote, if anthropology is to be considered as a scientific study, its subject matter cannot be individual cultures, but culture taken as a whole; the rôle of individual cultures being to offer, according to their own characteristics, special angles from which the basic functions of culture, although universal in application, can be more easily reached.

This will perhaps help us to eliminate preliminary questions which otherwise could have proved very difficult. Anthropologists in South America and elsewhere have been eagerly debating the question of whether these South American tribes—nomadic, relying mostly on collecting and gathering, with little or no agriculture, little or no pottery, and, in some cases, with no dwelling other than crude shelters—should be considered as truly primitive and as having preserved their exceptionally low cultural level through tarriance, or whether they did not previously possess a higher type of social and material organization and have regressed to a pseudo-archaism under unfavorable circumstances. The Nambikuara are one of those tribes which, along with the Siriono, on the other side of the Guaporé valley, the Cayapo, Bororo, Karaja of central Brazil, the so-called *Gé* of Central and Eastern Brazil, and some others, together form a kernel of primitiveness surrounded, in the West, by the higher tribes of the upper Amazon, the Bolivian plain and the Chaco, and from the Orenoco's to the La Plata's estuaries, by a coastal strip inhabited mostly by the Arawak, Carib and Tupi-Guarani linguistic families. An independent linguistic stock divided into several dialects, the Nambikuara seem to display one of the more backward cultures in South America. At least, some of their bands do not build huts and are wholly ignorant of pottery and, even among the others, these two arts are exceedingly poor. There is no weaving, except for the narrow arm and leg bands which are made of cotton; no dress whatsoever, either for the men or for the women; no sleeping contrivances, such as hammocks or platforms; the natives being used to sleeping on the bare ground without the protection of blankets, mats or hides.

clude at least one stretch of river and the "galeria" forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. Within this hunting territory they have camping places rather than villages. A semipermanent camp site where fields are cultivated for 2 or 3 years is known as *sinaidéu*. Any place where the band or a family may stop overnight is known as *sidaru*. At present the Wakítisu band has one house (*síru*) at the place where it is farming. The entire band occupies the house, each family having its own fire around which it sleeps at night. The unmarried men gather around another fire. Julio informed me that their house is rectangular with stake walls and a gable roof covered with sapé thatch. Some years ago when the band was larger he said they occupied a different place on which they built three houses. These houses were built by placing a series of saplings into the ground to form an oval. The tops were then fastened to a ridge pole, the framework being covered with sapé or palm fronds. A smaller beehive-shaped house is made in the same way. Houses of this type are from 6 to 10 feet high. Near the living house they build a small flute hut (*sinaidéhlaru*) and, when the occasion demands, a shaman's hut (*silderutu*).

If the weather is cold while they are out hunting the band or the family may build a temporary brush hut for the night. Sometimes only a windbreak (*sisidutu*) is considered sufficient. On warm nights during the dry season the group camps under a tree. In favorite hunting places the same camp site will be used repeatedly. When the soil around the permanent camp site or village becomes exhausted, fields are cleared some distance away and small huts are put up for the workers. As the distance increases the old camp site is eventually abandoned and a new camp site is established.

As the Nambicuara do not use hammocks, beds, or seats, there is not much in the way of furniture in their shelters. Utensils are restricted to a few gourd vessels, tin cans, burden baskets and small flat baskets, fire fans, bows and arrows, and tools used by men. When they move, these articles are placed in burden baskets which are carried by the women. The Wakítisu do not

At the house door —village on the Juina River

Cocozu hut — Juina River

Nambicuara village

341 The circular spot formed by the village grounds in the middle of the bush gradually acquires the appearance of a star, owing to the paths that lead out from its circumference.

[412 413] Access to the village grounds is free. There is no fence or hedge to prevent admittance to the plaza; no fortifications or other defensive features are to be found in the vicinity. (1)

> 1. The Tupian Indians of the Gi-Paraná, on the other hand (like the Tupinambá of old and other [tribes]), obstructed the paths leading to their villages with spikes [estrepes] which had to be removed when they established relations with the Rondon Mission. (See Col. M. Rondon, Conferencias [Lectures], pp. 161-162.)

Nambicuara villages always consist of two houses, which are set face to face at opposite ends of the plaza.

[37] [220] The region consists of extensive forests, stretches of scrubland [cerrado], areas of nearly impenetrable bush [charravascal], and a few stretches of open prairie. The Indians prefer the scrubland as the site of their villages.

The forest is dangerous on account of snakes, wild beasts, and even timber which often crashes down on the hunters; the prairie is dangerous because it exposes the village to enemy attack and does not afford any protection against invaders. But the scrubland serves the purpose very well; it has few disadvantages and many advantages.

342 This the Nambicuara know well: their hut blends into the greyish hues of the surrounding vegetation; it is like a shrub among other shrubs; from a distance it can hardly be distinguished. Its shape, though well defined, merges into the vague forms of the bush.

Naturally, those whose eyes are accustomed to the dust-veiled mass of xerophytic upland vegetation can quickly spot the huts; the illusion cannot deceive an experienced eye. But the mimicry is nevertheless real.

382 [221] The villages consist of fixed, permanent dwellings; in addition to these home shelters, the Nambicuara also use a type of temporary shelter which they erect rapidly wherever they may happen to be when night falls.

The permanent houses of the Juruena Valley differ but slightly from the dwellings of those Indians who live in the farther reaches of the Serra do Norte.

The Cocozu village we visited on the Juina River consisted of two houses. The first was small, hemispherical, poorly built, and

[opp. p. 220]

Distribution of round and oval houses (After Nordenskjöld).

(Caption on p. 21.)

342 provided with a fairly large doorway; it could easily hold some twenty people. The other had the shape of a triangular prism, with one of its [lateral] faces to the ground. It was more carefully constructed, and measured nine meters in length, three and a half in width and two and a half in height. One of its ends was closed; on the side, hidden by the leaves which hung from the roof, there was a small door. The other end was fully open. The hut was oriented in an east-west direction, the closed end facing the east. Thus in the afternoon the rays of the sun entered the house for a few hours.

Two forked stakes, one at each end of the building, supported the ridgepole. [222] Several beams designed to hold the huge covering leaves of the babassu palm ran from the ridgepole to the ground.

The palms which were laid on one side of the roof were folded at the top over the ridgepole onto the other side; in order to hold them in this position, two rods ran the length of the house, tied to [283 827] the inner beams with knots of embira (1) cord.

1. A bast fiber yielded by one of the embira trees. (Ed.)

Tagnani and Tawite villages also consist of two huts. Each, with its entrance oriented in an east-west direction, is evenly circular at ground level and conical in shape. From the apex of the cone a pole rises a few spans above the roof; it is always forked at the tip, as shown in the photograph. The doorways are set on opposite sides of the building, facing each other.

We still do not know how the Nambicuara trace the circle which delimits the hut; it must be a freehand line, for that is how they draw this figure on their gourds. In the middle of the house they set up four stakes forked at the tip and a central support. [Fig. 16]

The forked stakes form an overhead rectangle of wood, from which flexible poles run down into the ground along the circle which delimits the house. These poles are secured and connected by horizontal rods which complete the framework of the hut. The covering consists of bacaba palm leaves arranged in layers. As seen from within the hut, the first layer consists of plaited leaflets fastened to the [223] woodwork. [Plate p. 226]

[226]

342.

Indian house--Festa da Bandeira (Carumi) River

516

Nambicuara village

342 The external layers cover the whole building, like very precise and well clipped sheets of straw. The side walls are not distinct from the roof, but mere extensions of it.

Of the two houses we have described, in the village close to the Carumi (or Festa da Bandeira) River, the larger covers 30 meters in circumference, the other 28. Their doorways measure 0.37 meters in width by 0.52 meters in height. These two houses stand on a plaza some twenty meters in diameter.

352 354 [252] Inside the huts stand three bamboo grids [giraus] to dry manioc scrapings, and two enormous black pots which could not have come through the doors; lighter utensils and various other implements, as well as ornaments, are kept in the ceiling thatch. This serves as the Indians' closet, where they hide their smaller belongings. [Fig. 24]

354 A small fire burns underneath each grid.

These grids were made up of four bamboo stalks sunk into the ground and supporting a horizontal grate of small bamboo reeds. They measured about two meters in length by one and a half in width.

The huts are not equipped with any smoke holes, and none are needed. The smoke of inside fires filters easily through the interstices of the thatch.

356 Around the dwelling, scattered or in heaps, lie disjointed bones, fragmented coconuts, pods of the jatobá bean, corn cobs, charcoal, and food refuse, mixed with worn-out tools and utensils.

412 In the village on the Festa da Bandeira River, I found beside a house a large object which I only failed to bring back because it would have been absolutely impossible to transport it. It was of a kind commonly found in the sambaquis [224] of the Atlantic coast: a rock pitted with several depressions large enough to hold a fingertip. To one side lay a prodigious quantity of small bacaba nuts, both shelled and unshelled. It has often been inferred that this implement was used to produce fires, but in the Serra do Norte it merely serves to shell palm nuts. This stone, however, was much larger than those generally encountered in the sambaquis. [222 262]

342 The temporary shelter consists of a screen of leaves and branches. The Indians may use it for a few days if hunting in the area is good; then they abandon it.

342 In order to erect one of these screens, which the muleteers call "little hunting huts" [maloquinhas de caça], and which are found scattered between the Juruena and Doze de Outubro rivers, the Indians begin by clearing the ground thoroughly. Then they plant two large leafy branches into the earth, one at each end of a straight line, and bend them at the top over a crosspiece held by two forked stakes sunk into the ground in front.

They complete the covering with straw or with grass rooted up for the occasion, the earth still clinging to its roots.

Inside--or rather beneath--the shelter, a small fire is lit.

Each screen covers an area of approximately two to four square meters. If the Indians are numerous, each family group erects its own shelter. The structure is actually a good representative of what German ethnologists call Windschrim [windscreen].

The Indians of the groups farther north (Tagnani, Tawite) do not build their temporary shelters in the same way.

As a general rule, their provisional dwelling is simpler: it consists of one or more leaves of the babassu or some other palm [225] which are stuck into the ground. This is not a windscreen, but a mere shade against sun or rain squalls.

361 These [latter] Indians, incidentally, live in a region of extensive forests and thick bush which affords adequate protection against the rain; whereas the others inhabit an area consisting largely of fields and scrubland. Another instance of the geographic environment conditioning human behavior.

[121] The Cocozu Nambicuara call their village sicú, while the Anunze call it chicê. These words have the general meaning of "dwelling place": they signify either "house" or "village."

We do not know with certainty how they build their permanent dwellings.

[342] The women alone take part in the building of a hunting shelter; they cut down the necessary branches, while the children help by gathering the grass and straw which serve to complete the roof.

They change their dwelling place drequently. While following the trail that brought us to the Juina River village where we spent the night, we passed several former sites of the village.

but smooth-edged axes, is more akin to the proto-Neolithic or transitional period. The present trend is to recognize in the New World Paleolithic industries . . . but no formal overlapping periods as in Europe. (R. L.)

A later footnote by Heloisa Alberto-Torres which is not reproduced here contains the following statement: ". . . an interesting ethnographic relationship is [established by] the absolute identity of Australian and Nambicuara axes . . ." (Ed.)

At first observation, the Nambicuara might seem to be an old and backward branch of the Paressi tribe.

[308] What we know of the physical anthropology, ethnography and linguistics of both groups, however, invalidates this supposition.

177 Yet their culture bears unmistakable signs of Paressi influence.
[302] The first is the beehive-shaped house, formerly built by the Paressi. This is an import among the Nambicuara: the original house of the Serra do Norte Indians is the screen of leaves and branches, similar to the kijême of the Botocudo (Windschirm of the German ethnologists) and reminiscent of the North American wigwam.

[Fig., p. 61A]

[309] And if they did not borrow the large "round house" from the Paressi, they adopted it from Bolivian Indians.

[310] Another instance of alien influence is the nose plume, which the Paressi do not wear now but which formerly, according to Antonio
177 Pires, they could not do without; and also the nose flute, which
534 [the Nambicuara] play unskilfully, as though it were a little-known instrument of yet unfathomed secrets.

The double flute seems to have been brought from the north. It must be an import from the Maue and Munducuru, with whom the Serra do Norte Indians have had serious clashes as already mentioned above.

clude at least one stretch of river and the "galeria" forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. Within this hunting territory they have camping places rather than villages. A semipermanent camp site where fields are cultivated for 2 or 3 years is known as *sinaiéu*. Any place where the band or a family may stop overnight is known as *siénu*. At present the Waklítisu band has one house (*sínu*) at the place where it is farming. 342 [361] shelter and lights its own fire in the opening. During the rainy season, villages consisting of one or more beehive huts are built on slight hillocks above the course of a secondary stream. Some of the *Eastern Nambicuara* build only shelters, although larger and stronger than the ones described. The beehive hut is very light, each about 10 to 20 feet (3 to 6 m.) in diameter. The frame consists of several long, supple poles, bent so that both ends can be stuck into the ground and tied together at the top, where they cross. Circular branches running horizontally are tied to the poles at different levels. The *Central* and *Western Nambicuara* have a more elaborate hut (pl. 37, *top*) whose perimeter is about 50 feet (15 m.). It has a central post from the base of which several forked poles run obliquely to support the bent poles of the external frame. All types of huts are thatched with horizontal layers of palm leaves, those of *Central* and *Western Nambicuara* exactly like the houses of their southern neighbors, the *Kepikiriwat*.

A gabled house without walls was also observed by Roquette-Pinto, who recorded other kinds of temporary huts. Some were built by sticking two branches into the ground, bending them over and attaching them to a horizontal pole tied to two perpendicular posts and covering them with bunches of grass.

352 513 The *Nambicuara*, although all their neighbors use hammocks, sleep on bare ground or on flat pieces of bark from the paxiuba palm. Because of this custom, the *Paressi* nicknamed them *Uaikoakôre*, "Those Who Sleep on the Ground."

CLOTHING AND ADORNMENT

[291] 301 Both sexes are naked, except that men sometimes tie a small tuft of buruty straw to their belt to cover the sex organs. Both men and women wear a thin, cotton-thread belt strung with white or black beads cut from river mollusk shells or from tucumã palm nuts. Such beads, with larger triangular pieces of mollusk shells, are also used for necklaces, earrings, bracelets, and other ornaments. Men wear grass or reed pins through their upper and lower lips; and, through their nasal septum, a larger pin made of a jacu (*Penelope*) feather mounted on a stalk covered with plaited cotton thread and porcupine quills and trimmed with a red toucan feather ring. Both sexes wear armlets and anklets of woven cotton, burity straw, feathers, parts of dried birds, fur, or mollusk or crawfish shells. Women wear one or more bracelets cut from the tail of the great armadillo and double bandoleers of plaited cotton dyed with urucú and decorated with porcupine quills. Hair ornaments are confined to men: circlets of plaited straw, of straw and and toucan feathers, or of fur with [714] feather pendants. War dress consists of a jaguar-skin bonnet (pl. 36, *top, left*) with a long, plaited buriti-straw tail painted with red stripes And dots hanging down from the nape of the neck.

361 clude at least one stretch of river and the "galeria"
621 forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. 342 Wakiltisu band has one house (*síau*) at the place
621 where it is farming. The entire band occupies the house, each family having its own fire around
[513] which it sleeps at night. The unmarried men gather around another fire. Julio informed me that their house is rectangular with stake walls and a gable roof covered with sapé thatch. Some years ago when the band was larger he said they occupied a different place on which they built three houses. These houses were built by placing a series of saplings into the ground to form an oval. The tops were then fastened to a ridge pole, the framework being covered with sapé or palm fronds. A smaller beehive-shaped house is made in the same way. Houses of this type are from
[343 6 to 10 feet high. Near the living house they
346] build a small flute hut (*sinedéhkleu*) and, when the occasion demands, a shaman's hut (*sildentau*).

342 If the weather is cold while they are out hunting the band or the family may build a temporary brush hut for the night. Sometimes only a windbreak (*siatdatu*) is considered sufficient. On warm nights during the dry season the group camps under a tree. In favorite hunting places the same camp site will be used repeatedly.
[241] When the soil around the permanent camp site or village becomes exhausted, fields are cleared some distance away and small huts are put up for the workers. As the distance increases the old camp site is eventually abandoned and a new camp site is established.

352 As the Nambicuara do not use hammocks, beds, or seats, there is not much in the way of
415 furniture in their shelters. Utensils are restricted to a few gourd vessels, tin cans, burden baskets and small flat baskets, fire fans, bows and arrows,
[482 and tools used by men. When they move, these
462] articles are placed in burden baskets which are carried by the women. The Wakiltisu do not

The external layers cover the whole building, like very precise and well clipped sheets of straw. The side walls are not distinct from the roof, but mere extensions of it.

Of the two houses we have described, in the village close to the Carumi (or Festa da Bandeira) River, the larger covers 30 meters in circumference, the other 28. Their doorways measure 0.37 meters in width by 0.52 meters in height. These two houses stand on a plaza some twenty meters in diameter.

Inside the huts stand three bamboo grids [giraus] to dry manioc scrapings, and two enormous black pots which could not have come through the doors; lighter utensils and various other implements, as well as ornaments, are kept in the ceiling thatch. This serves as the Indians' closet, where they hide their smaller belongings. [Fig. 24]

A small fire burns underneath each grid.

These grids were made up of four bamboo stalks sunk into the ground and supporting a horizontal grate of small bamboo reeds. They measured about two meters in length by one and a half in width.

The huts are not equipped with any smoke holes, and none are needed. The smoke of inside fires filters easily through the interstices of the thatch.

Around the dwelling, scattered or in heaps, lie disjointed bones, fragmented coconuts, pods of the jatobá bean, corn cobs, charcoal, and food refuse, mixed with worn-out tools and utensils.

In the village on the Festa da Bandeira River, I found beside a house a large object which I only failed to bring back because it would have been absolutely impossible to transport it. It was of a kind commonly found in the sambaquis [224] of the Atlantic coast: a rock pitted with several depressions large enough to hold a fingertip. To one side lay a prodigious quantity of small bacaba nuts, both shelled and unshelled. It has often been inferred that this implement was used to produce fires, but in the Serra do Norte it merely serves to shell palm nuts. This stone, however, was much larger than those generally encountered in the sambaquis.

The temporary shelter consists of a screen of leaves and branches. The Indians may use it for a few days if hunting in the area is good; then they abandon it.

341 [226] We do not know yet what determines these shifts to nearby locations; they may perhaps be caused by the death of an [74] Indian or by some communal misfortune. The distances involved are so small that the moves could not possibly derive from any significant ecological changes.

342 In order to keep rain water from seeping underneath the thatch, the Tagnani and Tawite Indians cover the inner ground perimeter of their conical huts with a series of overlapping plates made of jatobá shells.

The rain does not leak in.

354 It would not be fair to imagine the interior of the huts as hot and stuffy; air penetrates freely in between the leaves.

Nevertheless, the situation changes when the Indians light their small fires. Happily for them, the thatch is sufficiently permeable to keep their eyes free from the grave diseases often encountered among primitive peoples whose dwellings are smoky.

352 Household furnishings are rudimentary; except for the grids mentioned above and a few large pots, nothing else might properly be termed a piece of furniture. All other objects are tools, artifacts, [84] weapons and ornaments [227] [plates p. 222] which they carry with them on every journey, no matter how brief. Only the heavier mortars and graters, which cannot be carried easily, are left in the hut. These barbarians in turn could say: "Omnia mea mecum porto" [everything that is mine I carry with me].

Straw pallets, cured hides, hammocks, sleeping platforms, cots and true beds represent types of bedding characteristic of different stages of civilization.

513 The use of pallets already indicates a certain degree of advancement; but the Nambicuara have no bed other than the earth. They sleep on the bare ground.

They did not possess the hammock, that inseparable companion of their neighbors the Paresi; now that they are acquainted with it, they hold it in high regard. It was difficult to obtain any rest among them during the night; no sooner had we set up our hammock than three or four candidates would appear... And once they had taken over, it was hard to get it back. We were frequently awakened by Indians who forcibly asserted their desire to sleep in the hammocks we occupied.

342 The external layers cover the whole building, like very precise and well clipped sheets of straw. The side walls are not distinct from the roof, but mere extensions of it.

fire, and the group of six personshas arrived late at the reunion, after an isolated trip. Fires 16 and 17, united at the winter camp (II), are completely isolated in camp (chart III); the same for fires 14 and 15 and for fires 3 and 10.

[24] (3) Since several families join around the same fire, it does not seem possible to deduce any rule of residence, which seems to confirm the impossibility of obtaining from the informants a clear answer to the question of whether the young couples establish themselves separately after marriage, or remain near the parents of the wife or the husband. In two cases, we see the daughters rejoin their parents fire: a12, abandoned by her husband, and a22 at the time of her widowhood. During the winter camp, the household of fire 4 resides with the parents of the husband; and household 6 with the wife's parents (fire 5 in the two cases). Likewise at this time, fire 2 is installed in the hut of the husband's "father." Finally, in two cases, one sees parents, unfit for the economic battle because of age or widowhood, installed at their daughter's fire, as A65 and a66, and

342 shelter and lights its own fire in the opening. During the rainy season,
[361] villages consisting of one or more beehive huts are built on slight hillocks above the course of a secondary stream. Some of the *Eastern Nambicuara* build only shelters, although larger and stronger than the ones described. The beehive hut is very light, each about 10 to 20 feet (3 to 6 m.) in diameter. The frame consists of several long, supple poles, bent so that both ends can be stuck into the ground and tied together at the top, where they cross. Circular branches running horizontally are tied to the poles at different levels. The *Central* and *Western Nambicuara* have a more elaborate hut (pl. 37, *top*) whose perimeter is about 50 feet (15 m.). It has a central post from the base of which several forked poles run obliquely to support the bent poles of the external frame. All types of huts are thatched with horizontal layers of palm leaves, those of *Central* and *Western Nambicuara* exactly like the houses of their southern neighbors, the *Kepikiriwat*.

A gabled house without walls was also observed by Roquette-Pinto, who recorded other kinds of temporary huts. Some were built by sticking two branches into the ground, bending them over and attaching them to a horizontal pole tied to two perpendicular posts and covering them with bunches of grass.

352 The *Nambicuara*, although all their neighbors use hammocks, sleep on
513 bare ground or on flat pieces of bark from the paxiuba palm. Because of this custom, the *Paressi* nicknamed them *Uaikoahöre*, "Those Who Sleep on the Ground."

CLOTHING AND ADORNMENT

[291] Both sexes are naked, except that men sometimes tie a small tuft of
301 buruty straw to their belt to cover the sex organs. Both men and women wear a thin, cotton-thread belt strung with white or black beads cut from river mollusk shells or from tucumã palm nuts. Such beads, with larger triangular pieces of mollusk shells, are also used for necklaces, earrings, bracelets, and other ornaments. Men wear grass or reed pins through their upper and lower lips; and, through their nasal septum, a larger pin made of a jacu (*Penelope*) feather mounted on a stalk covered with plaited cotton thread and porcupine quills and trimmed with a red toucan feather ring. Both sexes wear armlets and anklets of woven cotton, burity straw, feathers, parts of dried birds, fur, or mollusk or crawfish shells. Women wear one or more bracelets cut from the tail of the great armadillo and double bandoleers of plaited cotton dyed with urucú and decorated with porcupine quills. Hair ornaments are confined to men: circlets of plaited straw, of straw and red toucan feathers, or of fur with
[714] feather pendants. War dress consists of a jaguar-skin bonnet (pl. 36, *top, left*) with a long, plaited buriti-straw tail painted with red stripes and dots hanging down from the nape of the neck.

SP17 Nambicuara SP17

people are seldom met together, the average size of the bands being twenty individuals, women and children included. This demographic collapse cannot possibly have taken place without affecting the structure of the band. But here, too, we do not need to concern ourselves with such questions as the type of political organisation in earlier times. It is probably more difficult to understand Nambikuara sociology now than it was thirty years ago. Perhaps, on the contrary, the much reduced Nambikuara band offers, better than in the past, a privileged field for a study in social anthropology. My contention is that, precisely on account of its extreme impoverishment, Nambikuara political structure lays bare some basic functions which may remain hidden in more complex and elaborate systems of government.

Each year, at the end of the rainy season, that is, in April or in early May, the semi-permanent dwellings laid in the vicinity of the gallery-forest where the gardens are cleared and tilled, are abandoned and the population splits into several bands formed on a free choice basis. Each band includes from two to about ten families usually tied by kinship. This may be misleading when a band is met, for one easily gets the impression that it is formed as an extensive family. It does not take long to discover, however, that the kinship tie between two families belonging to separate bands may be as close, and eventually closer, than between two families inside the same band. The Nambikuara have a simple kinship system based on cross-cousin marriage and the subsequent dichotomy between "cross" and "parallel" in every generation. Therefore, all the men in one generation are either "brothers" or "brothers-in-law," and men and women are to one another either siblings (true or classificatory) or spouses (true or classificatory). Similarly, children are, in relation to the adults, either sons and daughters (true or classificatory) or nephews and nieces, which is the same as actual or potential children-in-law.[1] As a result, there is no great choice of terms to express kinship, and this explains why kinship inside the band may appear closer than it actually is, and kinship between people belonging to different bands more remote than shown by genealogies. Furthermore, a bilateral cross-cousin marriage system functioning in a relatively small tribe must produce a progressive narrowing, and even a multiplication, of the kinship ties between any two individuals. This is a supplementary reason preventing family

226 headwater streams. The deep clear streams make fishing with timbó difficult. Game in the forests and on the plain is scarce. Yet by exploiting all the resources of the area the Nambicuara are able to survive. In contrast to the other tribes 262 reported in this monograph the Nambicuara have the broadest resource base, as the list of their resources in Appendix 1 indicates.

132 The Eastern Nambicuara occupy the high plateau between Utiarity and Vilhena. At Utiarity the altitude is 442 meters and at Vilhena [131 133] 665 meters. The dry season extends from May to September. Except for occasional south winds, which bring a cold drizzling rain for a day or two, the season is clear, cool, and dry, the daily temperatures ranging from 60° to 80° F. During this 132 period the grass withers, the livestock of the white 221 men having to subsist on shrubs and what fodder the owners can provide. Horses and mules, par- [224] ticularly, suffer during these months. In August the Indians burn the dry grass so that with the first showers new grass can grow out and attract the deer, which the Indians can then hunt.

[805] The dry season, which the Nambicuara call *kwémbire*, is the most difficult. By the end of June they have consumed the manioc, maize, beans, and other crops which they have planted. During July and August they subsist on palm nuts, cumbaru beans, fruta de lobo, snakes, insects, fish, and whatever animals they can kill on the plateau or in the forest. The rainy season 805 (*wahásu*) is divided into periods depending upon the fruits as they come into season. September 221 is known as *pañdúwasu*, for during this period the people depend upon the jaboticaba fruit. October and November are called *pa'asadjíru*, for during these months the bacaba palm nut ripens. December and January are termed *dáru*, or piqui time. February and March are known as *cacáru*, which appears to cover a variety of berries and small fruits. April and May are termed *dasapañdíru*, as many fruits and nuts come into season, particularly, the cashew nut. During these months the garden crops also come in, giving the Nambicuara a short period of abundance.

SETTLEMENTS AND SHELTERS

361 Each of the four Eastern Nambicuara bands 621 has a defined area within which it hunts, fishes, collects, and grows its crops. These territories in-

[p. 87 (A)]

clude at least one stretch of river and the "galeria" forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. Within this hunting territory they have camping places rather than villages. A semipermanent camp site where fields are cultivated for 2 or 3 years is known as *sinaiéu*. Any place where the band or a family may stop overnight is known as *siéwa*. At present the Wakitiéu band has one house (*siéu*) at the place where it is farming. The entire band occupies the house, each family having its own fire around which it sleeps at night. The unmarried men gather around another fire. Julio informed me that their house is rectangular with stake walls and a gable roof covered with sapé thatch. Some years ago when the band was larger he said they occupied a different place on which they built three houses. These houses were built by placing a series of saplings into the ground to form an oval. The tops were then fastened to a ridge pole, the framework being covered with sapé or palm fronds. A smaller beehive-shaped house is made in the same way. Houses of this type are from 6 to 10 feet high. Near the living house they build a small flute hut (*sinadéhlaru*) and, when the occasion demands, a shaman's hut (*sihdeatu*).

If the weather is cold while they are out hunting the band or the family may build a temporary brush hut for the night. Sometimes only a windbreak (*siatdatsi*) is considered sufficient. On warm nights during the dry season the group camps under a tree. In favorite hunting places the same camp site will be used repeatedly. When the soil around the permanent camp site or village becomes exhausted, fields are cleared some distance away and small huts are put up for the workers. As the distance increases the old camp site is eventually abandoned and a new camp site is established.

As the Nambicuara do not use hammocks, beds, or seats, there is not much in the way of furniture in their shelters. Utensils are restricted to a few gourd vessels, tin cans, burden baskets and small flat baskets, fire fans, bows and arrows, and tools used by men. When they move, these articles are placed in burden baskets which are carried by the women. The Wakitiéu do not

[10] The position of all groups known to be scattered through the Serra do Norte and Juruena Valley is recorded on the ethnographic map of the region which goes with these notes.[1]

[218] The exact meaning of the names cited above cannot yet be given with certainty. In the light of existing data, however, their study leads to the following conclusions which cannot be far from the truth.

Cocozu: "Uncles"; thus called by the others, perhaps, because they are the most primitive members of the whole tribe.

[578] Anunzu: This is clearly a corruption of the term anungzú or anungçú, which means "woman's milk"--a disparaging epithet like so many others found throughout the Americas; it may mean "infants" (unweaned babies).

Uaintaçu: Apparently a corruption of uintaçú, which means "alligator" [Port. jacaré] in the language of the Juina Nambicuara. The Uaintaçu group would thus be none other than the old Jacare tribe mentioned in the first chapter of this work.

Tagnani: They are obviously the Tamarari of the old geographic maps; they should be equated with the Tamarare or Camarare, who gave the river its name and who are mentioned in several ancient documents.

Tawite: This word signifies "child" or "son" [offspring], a common appellation among other tribes as well.

In order to avoid future confusion, I propose to retain the name "Nambicuara" in conjunction with the specific name peculiar to each group.

[579] The villages of the Serra do Norte Indians are usually built on the crest of small hills, far from the watercourses. Some are more than one kilometer distant from the nearest river or stream.

It may be assumed that the choice of such sites has a twofold aim: the Indians suffer less from mosquitoes and they dominate the surrounding territory, which is an advantage to people leading as they did up to now a life of constant warfare.

The village is built on a large plaza, fifty meters in diameter; once cleared of bush, which is rooted up [219] by hand, the ground is kept clear by the constant tread of feet. One night of dancing, with its endless beat along the same path, suffices to smooth out the village square.

[580]

[1] [See map following foreign text, col. 16 - Analyst]

7: Roquette-Pinto--20 E-4, 5 (no date) 1938 SP17 Nambicuara SP17 (ca. 1912)

321 The circular spot formed by the village grounds in the middle of the bush gradually acquires the appearance of a star, owing to the paths that lead out from its circumference.

[312 +13] Access to the village grounds is free. There is no fence or hedge to prevent admittance to the plaza; no fortifications or other defensive features are to be found in the vicinity. (1)

> 1. The Tupian Indians of the Gi-Paraná, on the other hand (like the Tupinamba of old and other [tribes]), obstructed the paths leading to their villages with spikes [estrepes] which had to be removed when they established relations with the Rondon Mission. (See Col. M. Rondon, Conferencias [Lectures], pp. 161-162.)

Nambicuara villages always consist of two houses, which are set face to face at opposite ends of the plaza.

[37] [220] The region consists of extensive forests, stretches of scrubland [cerrado], areas of nearly impenetrable bush [charravascal], and a few stretches of open prairie. The Indians prefer the scrubland as the site of their villages.

The forest is dangerous on account of snakes, wild beasts, and even timber which often crashes down on the hunters; the prairie is dangerous because it exposes the village to enemy attack and does not afford any protection against invaders. But the scrubland serves the purpose very well; it has few disadvantages and many advantages.

342 This the Nambicuara know well; their hut blends into the greyish hues of the surrounding vegetation; it is like a shrub among other shrubs; from a distance it can hardly be distinguished. Its shape, though well defined, merges into the vague forms of the bush.

Naturally, those whose eyes are accustomed to the dust-veiled mass of xerophytic upland vegetation can quickly spot the huts; the illusion cannot deceive an experienced eye. But the mimicry is nevertheless real.

342 In order to erect one of these screens, which the muleteers call "little hunting huts" [maloquinhas de caça], and which are found scattered between the Juruena and Doze de Outubro rivers, the Indians begin by clearing the ground thoroughly. Then they plant two large leafy branches into the earth, one at each end of a straight line, and bend them at the top over a crosspiece held by two forked stakes sunk into the ground in front.

They complete the covering with straw or with grass rooted up for the occasion, the earth still clinging to its roots.

Inside--or rather beneath--the shelter, a small fire is lit.

Each screen covers an area of approximately two to four square meters. If the Indians are numerous, each family group erects its own shelter. The structure is actually a good representative of what German ethnologists call Windschrim [windscreen].

The Indians of the groups farther north (Tagnani, Tawite) do not build their temporary shelters in the same way.

As a general rule, their provisional dwelling is simpler: it consists of one or more leaves of the babassu or some other palm [225] which are stuck into the ground. This is not a windscreen, but a mere shade against sun or rain squalls.

● 361 These [latter] Indians, incidentally, live in a region of extensive forests and thick bush which affords adequate protection against the rain; whereas the others inhabit an area consisting largely of fields and scrubland. Another instance of the geographic environment conditioning human behavior.

[421] The Cocozu Nambicuara call their village ziçu, while the Anunze call it chicê. These words have the general meaning of "dwelling place": they signify either "house" or "village."

We do not know with certainty how they build their permanent dwellings.

[343] The women alone take part in the building of a hunting shelter: they cut down the necessary branches, while the children help by gathering the grass and straw which serve to complete the roof.

They change their dwelling place frequently. While following the trail that brought us to the Juina River village where we spent the night, we passed several former sites of the village.

361 [226] We do not know yet what determines these shifts to nearby locations; they may perhaps be caused by the death of an [748] Indian or by some communal misfortune. The distances involved are so small that the moves could not possibly derive from any significant ecological changes.

342 In order to keep rain water from seeping underneath the thatch, the Tagnani and Tawite Indians cover the inner ground perimeter of their conical huts with a series of overlapping plates made of jatobá shells.

The rain does not leak in.

354 It would not be fair to imagine the interior of the huts as hot and stuffy; air penetrates freely in between the leaves.

Nevertheless, the situation changes when the Indians light their small fires. Happily for them, the thatch is sufficiently permeable to keep their eyes free from the grave diseases often encountered among primitive peoples whose dwellings are smoky.

352 Household furnishings are rudimentary; except for the grids mentioned above and a few large pots, nothing else might properly be termed a piece of furniture. All other objects are tools, artifacts, [334] weapons and ornaments [227] [plates p. 222] which they carry with them on every journey, no matter how brief. Only the heavier mortar and graters, which cannot be carried easily, are left in the hut. These barbarians in turn could say: "Omnia mea mecum porto" [everything that is mine I carry with me].

Straw pallets, cured hides, hammocks, sleeping platforms, cots and true beds represent types of bedding characteristic of different stages of civilization.

513 The use of pallets already indicates a certain degree of advancement; but the Nambicuara have no bed other than the earth. They sleep on the bare ground.

They did not possess the hammock, that inseparable companion of their neighbors the Parecí; now that they are acquainted with it, they hold it in high regard. It was difficult to obtain any rest among them during the night; no sooner had we set up our hammock than three or four candidates would appear... And once they had taken over, it was hard to get it back. We were frequently awakened by Indians who forcibly asserted their desire to sleep in the hammocks we occupied.

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life. 301

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard. 302 [386]

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton. 481 501 354

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string. 283

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Aramaté*" type (pl. 37, *center, right*). 286

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour. 285

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of rosewood bark. 323 [314]

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood. 412 [372] [373]

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the 411

subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A favorite dish is to crush in a mortar manioc cakes with boiled beans, broiled meat, ants, palm nuts, monkey and bird bones.

As an example of the variety of uses to which the Nambicuara can put a plant we can take the buriti palm: (1) They eat the pulp surrounding the scaly covered nut. (2) They use the fiber from the new growth to make twine. (3) They use the tough, flexible cortex of the frond stalk for making baskets. (4) They fell the buriti so that a certain variety of grub can collect and multiply in the starchy pith in the heart of the tree. The grubs or larvae they then eat uncooked. (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buriti palm has male associations, for only men can prepare its products. When a male child dies a piece of buriti fiber is left over his grave.

The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 18 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick becomes into small smouldering balls. These he places into a handful of dry buriti fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

The material equipment of the Eastern Nambicuara is extremely simple. Many items, such as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small gourd and the few gourd vessels, small baskets, and twine, the women carried

e os lobulos das orelhas. Através dos orificios feitos no nariz passam pequenos pedaços de madeira—*enfeites*; dos lobulos das orelhas fazem pender brincos feitos de pequenas conchas do oleo. Usam braceletes, pulseiras e pernoiras tecidos com fundas; e ao redor do pescoço, um colar de contas de Miuellia (*Oncomyzus bicolor*, *Mart.*). Vivem de caça; mas tambem plantam milho, cará (*Dioscorea*), batata (*convolvulus*), mandioca e feijão. Fazem uma farinha muito semelhante ao tapioca brasileira.

Os indios que iam ao posto dormiam sobre o chão. Este fato tem uma grande importancia, que será acentuada ainda mais, si os linguistas puderem aproximar os idiomas dos lobados pelas tribus do grupo Gê. Certamente é preciso maior indagação para que se possa concluir alguma coisa; mas devemos ainda notar que não foram encontradas redes de dormir nas cabanas dos Nhambiquára, onde, em diferentes ensaios, foi possivel examinar todo o mobiliario desses habitações. E si foram confirmados os epitetos de R. Schuller sobre a natureza do grupo

linguistico Gê, passarão os Nhambiquára a fazer parte da familia Arauk, onde já se encontram os seus vizinhos Paressi.

Na colegão etnografica recebida pelo Museu, enviada pelo Coronel Rondon, acham-se varios exemplares ellucidativos encontrados nas tribus, bijóus e de uma cerimonia de mascaras muito semelhante ao "Khéhlé" dos Paressi. Existem tambem na colegão algumas amostras de leves bijóus. Fiamma negra que emolam o fundo a temperatura muito baixa, adquirindo intenso brilho, e dos pendentes claro redondo; parece que é uma mistura de resina do Cumaru (*Syphonia globulifera*), e oleo. O principal emprego desta massa é a fixação dos enfeites que ligam a ponta á haste das flechas.

Os artefactos dos Nhambiquára têm um certo valor. Para a confecção dos alargadores usam os lobulos do lombo (Fig. 1), sendo os foliculos tratados em grupos de 4, dois

273 the usual process: they masticate manioc or maize and allow the mush to ferment in large pots. One drink thus extracted from the wild pineapple was held in high regard by the personnel of the Telegraph Line.

[263] They are especially fond of monkey meat--a last vestige, 266 perhaps, of their former cannibalistic tastes.

I do not think that cannibalism still exists among them. But I believe that it has not been long since the habit was lost.

It is true, nevertheless, that they often accuse one another of this practice; they make such accusations in a perfectly clear manner, by means of unequivocal signs.

● 372 [233] They make fire by rubbing together two rods similar to those found elsewhere in Brazil.

This procedure takes much longer than might be expected.

The Indian begins by placing a dry leaf upon the ground; upon it he rests the "stationary fire stick," which he supports with his foot and knee.

[Fig. 28]

Holding the "movable fire stick" between the palms of his hands, he imparts to it the necessary rotary motion, bearing down with it at the same time against the other stick. This motion forces the hands downward along the rod; [when he gets to the bottom], the Indian starts again from the top. Now and then he stops briefly to lick his palm, which smarts from the friction. After a while, when sweat is already beading his forehead, a spark strikes up among the tinder which has been deposited on the leaf.

This process differs from the classical technique only by the presence of the protective leaf.

Because this procedure is laborious, the Indians carry it out with reluctance. Desirous of obtaining a film which would document all their routine activities, I had great difficulty in persuading an Indian to make fire. This is the reason why, of all gifts, matches are among those valued most highly; to make fire after their fashion on a rainy day or in humid weather is a hard and laborious task.

[262 [267 [195] The Tagnani and Tawize also eat a certain kind of mushroom (Polyporus sp.) which the others disregard.

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéra, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Utílkoikoríand Cutiahaniré to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guayeurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Utílkoikoré, and who, as now stated, are Nhambiquára. This name of Utílkoikoré is given by the Parecí of the sub-tribes Kazimití and Uaimaré of the rivers Arinos, Sacuriá-iná, Tabóra-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the *Rio Verde*, the Julia, Caloçal and Jauruí. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of cocoon. They wear armlets, bracelets, leg ornaments and head collars made from the fruit of the mucúcha. They live by the chase, but also plant maize, yams, potatoes, manihot, and bananas. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atsiri and the Amúdes of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kétchí of the Parecí, made from pounded manihot. The native *breu* or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Cuminí and wax, and is preserved in leaves of the Malé-malé palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an *arara* or mutúm feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 60 to 2m. 38 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malé-malé and *breu*. The upper disk has three orifices.

411
278

experiment with the resinous, supposedly poisonous substance found on the tip of one of these arrows. He injected a concentrated solution of it into frogs and guinea pigs, and the only resulting symptoms were muscular twinchings, unsteady gait, and some salivation.]

[Fig. 60]

411 Aiarçú: The tip is blunt; it is used to stun birds that are to be caught alive or free from blood, which stains the feathers. [See fig. ... (59), p.55A.] Often a smooth tip wrapped in a straw pellet is used for the same purpose.

[227] [274] Some unique fishing arrows have a double, triple or quadruple tip and a bone barb. [See fig. ... (37), p. 368.] Some have feathers at the base, others do not. . . . .

All Serra do Norte arrows have shafts made of thin bamboo. The various parts of the weapon are secured with strips of the strong [324] imbé liana (Philodendron imbe, Mart.).

[Fig. 61] The clubs are extremely crude weapons of attack and defense, mere portions of thick branches cut when the occasion demands it.

[324] [275] The axes of chipped stone are uniform in type. They are wedge-shaped, made of diorite, and they average two kilograms in weight. The handle is a piece of creeper stem, perhaps from a Bauhinia. The pitch and cord used to fasten the stone make the tool surprisingly strong. . . . .

381 The pitch is made of mastic resin, jatai (Hymenea stigonocarpa [324] or H. stilbocarpa), and wax, as well as other unknown substances. It is placed in pots and subjected to the action of fire, then kept in pellets fastened to embira strips or in loaves wrapped in leaves. Both the arrow "poison" and the axe pitch are called by the name of duhutaarú, which means "wax."

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life.

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard.

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton.

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string.

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Aruaak*" type (pl. 37, *center, right*).

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour.

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark.

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood.

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the

301 imitate our wedding rings; necklaces [242], several meters long, made of black beads; the feathers of black birds; the limbs of coleopters, also black; all attest to this preference.

[Fig. 45]

[237] The women make beautiful one-piece bracelets from the tail rings of the giant armadillo which they polish with wet stones. [See Fig. 65, p. 59A.]

[238] The Uaintaçu Nambicuara, who come to Campos Novos by way of the Guaporé and who are much more insolent, crude, wary and suspicious, do not attempt to wear the delicate lip plugs used by their relatives.

Some of them wear a porcupine quill fastened to their lip; others, a wooden splinter or a spike from some tree.

291 562 Also characteristic of the whole Serra do Norte and Juruena Valley is a palm-fiber cape (ialaçu), which hangs down the backbone from the neck. [See Fig. 66, p. 59B.] Women do not wear it; it is another example of male foppishness.

302 Body painting with urucu constitutes part of the ornamentation for men as well as for women.

[Plates, p. 236]

[243] They paint themselves on festive occasions; they do not [515] draw lines on the skin, but smear the dye all over their face. Women, after bathing, redden their whole body in this fashion.

[Fig. 44]

● [516] The Indians of the Juruena dissolve the urucu powder in pure water; the Tagnani prepare a paste or cream by mixing the dye with the fat of various animals, and perfume it quite pleasantly by way of some unknown process. (1)

1. The Bororo use mastic resin to perfume the urucu paste. See Alfredo de Andrade, "Estudo dos materiaes corantes [A Study of Coloring Materials]," Archivos do Museu Nacional, Vol. 28, p. 183.

372 They make fire with mastic resin sticks, the tips of which are wrapped in straw to protect them from the rain.

[Fig. 63]

291 415 Their plots are worked with pointed sticks. The seeds of urucu, gourd plants (Lagenaria) and cotton are kept in leaf containers.

275 520 Medicinal fruit (Solanum mammosum) is also saved, as well as roots, leaves, etc.

[Fig. 31]

586 The collection contains two samples of dyes: a paste of urucu and fat, sweetly scented, which the women use to paint their body after the bath (hudulukaidi); and a variety of red ocher. [279]

248 Cotton (1) is represented by seeds (rim de boi variety) in leaf

[171]

1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Andes and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[283 286] containers; cotton thread (kondzú) from a spindle (gdaretatú); skeins [555] of spun cotton; cotton fabric (sareguêzê--strap used to carry children).

[283] The spindle is made of a palm splinter imbedded in a round potsherd.

[Fig. 64]

415 524 Kamçá are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

[See fig. ...(28) p. 308.]

for about seven
months these bands go wandering across the prairie in search of small
[22] game, small animals such as caterpillars, spiders, grasshoppers,
rodents, snakes, lizards, and so forth, and fruits, grains, roots or
wild honey—in short, all that might keep them from dying of hunger.
Their camps, set up for one or several days, sometimes for several
weeks, consist of as many temporary shelters as families, made of
palms or branches stuck in a semi-circle in the sand and connected
at the top. This is the period when the quest for food absorbs all
activities. The women equip themselves with digging sticks and
221 the men hunt with the bow and arrow, of which several types must be
● 411 distinguished. The eastern groups have a bow with a flat section
184 which evolves toward a convex-plane section or a concave-convex
section when one moves westward. As for the arrows, those made
for hunting birds have a blunted tip. Arrows for fish have three to
five points, each one formed like a minute harpoon, and the item
is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 96.

by a sheath of bamboo, are reserved for hunting monkeys and small
game. Those for large game have a long lanceolate point. The barb
is attached or sewed on. Besides the bow and arrow, the men use a club
[159] which often takes the form of a javelin, and its use is reserved for
magic and war operations (1).

1. Cf. below, p. 99.

824 The primary materials of the indigenous industry consist of varied
825 woods, wax from wild bees, resin, fibers of the buriti palm trees
(Mauritia vinifera) and tucum (Astrocaryum tucuma) bone of the
monkey, teeth and claws of mammals, fur (only to make ornaments),
feathers, quills of porcupines, vegetable shells and river shells, stones,
412 cotton and grains. As implements they have knives made from a sharp
piece of bamboo, from stones crudely fashioned, or from fragments
of iron or steel obtained through exchange, and fixed with the aid of
wax and cord between two pieces of wood forming the handle. Drills
are made of a borer of stone or iron mounted at the end of a stick
[77] which they turn between their palms. The Rondon Commission ex-
panded the use of axes and metal hammers, and the old stone axes
serve now only as small anvil blocks for fashioning shell or bone.
[415] The use of stone polishers must also be mentioned and, among the
objects of current usage, the spindles, combs, baskets and gourds to
carry water.

789 Poison is thus nãñde par excellence, although the latter can exist in other forms, at the same time less precise and more complex. We attach extreme importance to the fact that a rigorously utilitarian technique of the manufacture of poisons is found associated with a theory which accounts for their effectiveness through the intermediary of metaphysical concepts. The presence among the Nambikwara of a curare reduced to a basic product, and whose preparation excludes all ritual, associated with the very low cultural level of these Indians, poses in a particularly impressive way the question of finding out if these characteristics which are very primitive are so by origin or constitute the residue of an impoverished culture. Now, it is much more reasonable to interpret the apparent contradiction of theory [121 174] and practice in matters of poison by the loss of complex rituals which farther north are attached to the making of curare, than it would be to explain how a theory of supernatural character could have been built on the bases of treatment which has remained purely experimental, of the root of the strychnos.

Besides the notion of nãñde we should examine another which is the object of a particularly advanced elaboration among the eastern groups, that of the atãñu (al). Atãñu signifies animal, but the use of the term by the Indians is complex. First of all it is the animal taken in a generic sense, in opposition to the inanimate. They present me with a honey cake and, pointing out the body of a bee which is still in it, I ask what it is. They do not answer, "it is a bee" but: atãñu, "it is the animal." Atãñu also means real animals, but ones without their own names in the vocabulary, and which are of particularly fearful character. Thus oxen are called by this name by the Nambikwara who never saw any [99] before the years 1910-1915, and who entertain a great fear of them. Then we find the same term to designate the stars (eastern groups), and the same name is given to the ticktock of the clock, both conceived of as realities animated by mysterious characteristics. Finally, atãñu is a special animal of supernatural essence, which is seen appearing in two cases—at night, on the road, in certain places and during certain periods, and upon the approach of death. In the first case, one risks being attacked and killed by the atãñu if one does not defend oneself 789 in the appropriate manner. This means is found in the throwing stick ●411 [épieu] (distinct from the digging stick), thrown in a prescribed manner. The throwing stick, a large piece of wood of flattened form [286 531] and pointed at the end is furnished with a handle usually decorated with black and white bark weaving (javelin: hĩ'dosu [al], kẽ'ũ'ere

789 [sic], makalé [cl]. This instrument is used in three circumstances:
411 in war; to conjure up (or to attract?) rain by manipulating it according to an approved ritual as if one were tracing signs in the air while brandishing it; finally to kill the atáiu, by throwing it in the direction of the apparition, using as intermediary a tooth of the jaguar: the throwing stick is placed obliquely in the left hand, the point turned in the direction of the atáiu, and the tooth, manipulated by the right hand, acts as a hook for projection. The atáiu appears only at night. It may borrow the form of the jaguar or of other animals who are then filled with murderous intentions. When the atáiu is caught in his terrestrial form at the point of the javelin, a great flow of blood is produced. The "supernatural" animal is never eaten. They abandon its body to the carrion.

789 In the second case, one is faced with a real theory of death.
761 The sick person who sees the atáiu appear knows that he is condemned, and the animal actually carries him off on the spot or returns to get him a little later. The current version of the death of A21, drowned in a river in July 1938, was that the atáiu carried him to the bottom of the waters. The atáiu would live in the water. An informant described it as having "a large mouth and lots of collars."

789 The southern, central and northern groups bear witness to a
771 more elaborate religious thought. Among these peoples, the preceding
74 notions are crowned by a third, which does not appear as clearly in the eastern groups although it is probably present, that of the wind and thunder, hypostasized in the forms of a semi-personal power named amã. (1) In these groups, this is substituted for the atáiu in the theory

1. The Tupi origin of this term is evident. One can compare Montoya, "amã: cloud of waters; Nogueira, "amã: cloud; Coudreau (Bibliothèque Linguistique Americaine, XV, 1892), "amane (Oyampi): rain; Gonçalves Diaz, "amana: (chuva) rain; Kissenberth (Baessler Archiv, VI, 1-2, 1916-1917), "amana, aman, amã (Tapirapé): rain; Nimuendaju (Zeitschrift für Ethnologie, XLVI, 1914), "amã (Lingua Géral): (chuva) rain.

of death, and it is possible to communicate with it through revelations and visions.

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life. 301

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard. 302 [386]

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton. 481 501 854

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string. 283

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Aramaé*" type (pl. 37, *center, right*). 286

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour. 285

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark. 323 [314]

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood. 412 [372] [373]

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the 411

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

411 string (secondary release). Four types of arrows are used: (1) featherless fishing arrow with three to five prongs; (2) bird arrow with a blunt point; (3) big-game arrow with a lanceolate bamboo point; and (4) poisoned arrow, used chiefly for hunting monkeys, with several barbs which are attached to the point with cotton wrapping and which break easily in the wound, being, therefore, usually protected by a bamboo sheath. The last three have a bamboo shaft and "Arara" feathering. Sewed feathering is known by the central and northern groups but seldom [726] used. For warfare, big game arrows with serrated bamboo points are used.

278 *Nambicuara* arrow poison is a curare prepared by grating the root of a *Strychnos* shrub, and by infusing (*Eastern Nambicuara*) or boiling (*Central* and *Northern Nambicuara*) it until the water evaporates and leaves a thick brownish substance, which is smeared on a wax-coated arrow point. It can be preserved in tiny pots for several months. Among South American arrow poisons, it is remarkable because it is made of only one vegetable substance and is prepared openly—in some groups by the chief or shaman, in other groups by anyone—without magical practices or taboos. Its great toxic properties were studied by Vellard (1939 b).

Other poisons of unknown composition are used for amorous or political revenge. They are in the form of powders and are kept in tubes made of feather quills, bamboo, or other woods, each ornamented with paintings and cotton or bark wrappings.

411 Clubs are carved in the shape of a flattened or cylindrical pointed spade; the handle is often adorned with black and white plaiting of philodendron bark and bamboo strips. Their purpose is mostly ceremonial.

SOCIAL AND POLITICAL ORGANIZATION

601 Kinship terms identify parallel-cousins with siblings, and cross-cousins with potential or actual spouses. Cross-uncles and cross-aunts are called by the same terms as parents-in-law and grandparents; parallel-uncles and parallel-aunts are equated with parents. Similarly, parallel-nephews and parallel-nieces are classed with children, and cross-nephews and cross-[502] nieces with children-in-law. Marriage is between cross-cousins or between the maternal uncle and his niece. Monogamy is the rule, but [595] polygyny is the privilege of the chief and other important men. Polygyny is usually with several sisters (sororal) or with a woman and her daughters by a former union. The first wife runs the household, subsequent wives being assistants to the husband. The deficiency of avail-[838] able women which results from polygyny is compensated by homosexuality between adolescent male cross-cousins (Lévi-Strauss, 1943 a).

622 The village is ruled by a chief, but each of the nomadic bands into which it splits during the dry season is led by a secondary chief. Chief-

[end plate 2]

412 in her burden basket, whereas the modern axes,
415 knives, and other tools, along with his ornaments, the man carries in a similar basket, or he straps this basket on the back of a boy while he walks in front of the file carrying his bow and arrows or gun ready to shoot whatever game is met along
[264] the way. Whenever they kill some animal or catch a few fish and feel hungry they stop and prepare a meal. During the dry season they are at home anywhere in their band territory, moving only when hunger spurs them on.

411 Today, of course, the Nambicuara have steel
412 axes and knives. The heavy equipment of the
177 Waklitisu band in 1949, consisted of three axes, two shotguns, and some half dozen hoes which were hidden near their permanent house. Each man had a butcher knife, but all men did not have bows and arrows. There did not appear to be any desire on the part of each man to possess these implements. So long as the band had a few of these objects everyone seemed to be satisfied. Cascudo, a widower when he arrived in Utiarity, did not possess a bow and arrow, nor a gun, nor an ax. By working for the Protestant missionaries he acquired an ax and when Marciano died he inherited his bow and arrows. After a
[439] few days, however, he had given the bow and arrows to a Brazilian in exchange for a felt hat.

412 Examining the hand tools which Julio used, the following articles were found: A chisel (*kwatíru*) made by inserting a piece of steel into a wooden handle wound with twine; a small bamboo
[306] knife (*alkúkwirikatu*); a hardwood drill (*kíkatu*), used with sand for perforating tucum nut shells in making beads; a piece of sandstone (*dálgisu*), used as a whetstone; a number of rough leaves of the lixeiro tree (*kis'énatu*), used as sandpaper; and a
415 comb (*ka'dlatu*). Each of Julio's three wives had a burden basket, a small square basket, and two or three gourd vessels of various sizes. A single wooden mortar and pestle did service for the whole band.

411 One of the most important implements of the Nambicuara is the bow, *kákisu*, made from the piuva (jacaranda-copaia) or the siriva palm (*Syagrus species*). By far the most common is the bow made from piuva, ranging between 6 and 7 feet in length, flat on the inside and convex on the outside. One of the bows examined measured 2 meters and 14 cm. in length, 4 cm. in width, and 1.5 cm. in

[p. 93 (A)]

411 thickness in the middle. This bow is made from the honey-colored heartwood of a small piuva tree. After cutting a piece of the required length the bow maker splits it by using two or three axes. He then trims off the outer layer of wood with an ax, shapes it with a knife, and polishes it with lixeiro leaves. The inner side of the bow is flat or slightly concave, depending upon how the wood splits. Shoulders are made at each end to hold the bowstring. The bow is made from green wood, no attempt being made to season it. The siriva bow is the same shape and is made in the same way but the black wood surrounding the center is used. The siriva bow is more common among the Western Nambicuara. [184]

The bowstring (*kalunutnisu*) is made from tucum fiber and is about one-eighth of an inch in thickness. The cord is much longer than required and the extra length is wound around the bow for about 6 inches just above the hand hold. The cord is wound from left to right, the running end being brought back over the previous turn to form a cross on the inside of the bow. The string is always smeared with urucú (*dúse*). As the bowstring wears out it is not removed but new lengths of tucum fiber are woven into the extra length. [283]

The basis of the Eastern Nambicuara arrow is the jointless shaft (*alukotrihatu*), which appears to be cane (*Gadua* sp.). Before being made into an arrow the cane shaft is heated over a fire to harden it. Into this cane shaft, which is roughly three-eighths of an inch in diameter, a piuva foreshaft (*ihdikatutu*) is inserted for a distance of 4 or 5 inches, leaving about 20 inches protruding. The joint is wound with sipó vine for about 6 inches. To feather the arrow, a 10-inch macaw feather (*akinintu*) is split and the halves are laid parallel to one another on opposite sides of the butt end of the shaft. The feathers are lashed to the shaft with cotton twine, the lashings being about an inch apart. Although the feathers are laid straight along the shaft, they assume a propellerlike pitch which gives the arrow its revolving motion when in flight. The lashings are covered with beeswax. The butt has a V-notch to hold the bowstring, which is again tightly wound with waxed cotton twine. By attaching various parts to the end of the foreshaft, four different kinds of arrows about 5 feet long are made. [237] [284] [237] [284]

411 (1) The *hánysu*, an arrow which is used for [223] shooting monkeys and large birds, is made by lash- [224] ing an inch-long slender barb of siriva palm or piuva about an inch back from the sharpened point of the foreshaft.

[227] (2) The *saltítsu*, or fish arrow, is made by lashing four slender points of wood about 2 inches long to the end of the foreshaft. This arrow need not be feathered. Today wire is sometimes substituted for the wooden points.

[223] (3) The *dánkisu*, or blunt bird arrow, used for shooting small birds, has a separate piuva foreshaft, the end of which forms a rounded flat surface about an inch in diameter.

[224] (4) The *hóptisu*, or big game arrow, has a broad split bamboo point about 12 inches in length which is lashed to the foreshaft. As the bamboo point is slightly grooved along the center, the foreshaft lies along the groove permitting it to be lashed firmly to the tapered sides of the point. Formerly curare poison was smeared along the groove. This was also the arrow used in war.

Sometimes a bamboo point is serrated on one or both sides. In former times, this arrow-head was poisoned with curare. It was attached loosely to the shaft so that when it struck an animal it became detached from the shaft. This arrow was used against big game like the jaguar, tapir, deer, and against human enemies.

The bow is held in a vertical position when shooting; the arrow is held with the thumb and forefingur while the middle and ring finger pull the bowstring, with the arrow resting against the hand side of the bow.

283 Cordage is made from the fibers of the tucum and buriti palms and from cotton. The tucum [306] palm (*Astrocaryum tucuma*), *hatátsu*, provides not only fiber but the hard shell of the nut is used for making the black, round, flat necklace washers, [259] and the thorns from the trunk are used as spikes in the manioc grater. Tucum twine which is a little stronger than buriti twine is used for bow-strings, for stringing beads, and for many other purposes. When a man needs tucum twine he sends his wife to gather the palm leaves. As the young trees grow in clumps, it is a simple matter for the woman to cut off a number of fronds. The woman then takes a long slender leaf, bends it double in the middle so that the woody fiber breaks, then doubles it back and pulls downward

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéra, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákoré and Quihanieré to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guaycurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoákoré, and who, as now stated, are Nhambiquára. This name of Uáikoákoré is given by the Parecí of the sub-tribes Kazinitís and Uaimaré of the rivers Arinos, Sacuriú-iná, Tahura-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Cabaçal and Jauxú. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of coconut. They wear armlets, bracelets, leg ornaments and bead collars made from the fruit of the mbacúba. They live by the chase, but also plant maize, yams, potatoes, mandioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atziri and the Amúdsa of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kêtêhê of the Parecí, made from pounded mandioc. The native *breu* or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Oanini and wax, and is preserved in leaves of the Malá-malá palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutúm feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 38 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malá-malá and breu. The upper disk has three orifices.

Indian of the Serra do Norte shooting an arrow for elevation.

000

[245] The Tagnani also use a kind of fish trap.

A rare type of blunt arrow is designed for the capture of birds which serve as playmates to Nambicuara children.

The birds are felled by the impact and caught easily. Some become used to their cruel captivity; a woodpecker (Colaptes campestris, Vieil) was occasionally imprisoned by a boy under a gourd. No sooner did the child remove the cup than the bird, instead of flying away, would perch upon him. It is true that the Indian nourishes his domesticated birds very well: he constantly feeds them from his own mouth, gently gorging them.

[Fig. 59]

To our intense surprise, as the cephalic measurements of an Anunze woman were being taken, a baby rat fell from the nape of her neck where it had apparently been living cozily, hiding in her hair as in the grass where it was born.

Doves (Chamepelius talpacoti), young vultures (Sarcoramphus papa, Catharista atratus brasiliensis, Bonap), monkeys and small owls are also domesticated in the Serra do Norte.

Before the days of the Rondon Commission, the Nambicuara were not familiar with the ox, the mule or the dog. They are still afraid of the ox because of its horns; they have a liking for the donkey, whose meat they find similar to that of the tapir.

[246] They are now good friends of the dog, which at first frightened them greatly; they steal a few whenever they can, and these dogs quickly take a fancy to [the Indians] because they are so well fed. In the master's eating gourd there is always room for the dog's muzzle.

They carry their children in a strap slung over the shoulder and across the chest, which the Cocozu make with straw and the others with cotton.

They take along everything they own on the shortest excursions; this is a nomadic habit surviving among a nearly sedentary people.

A population as large as that of the Serra do Norte would be unable to subsist exclusively on hunting and fishing. The Indians would be forced to travel far and wide in search of food; they would have been annihilated long ago, or else deprived of those characteristics which only their isolation could maintain.

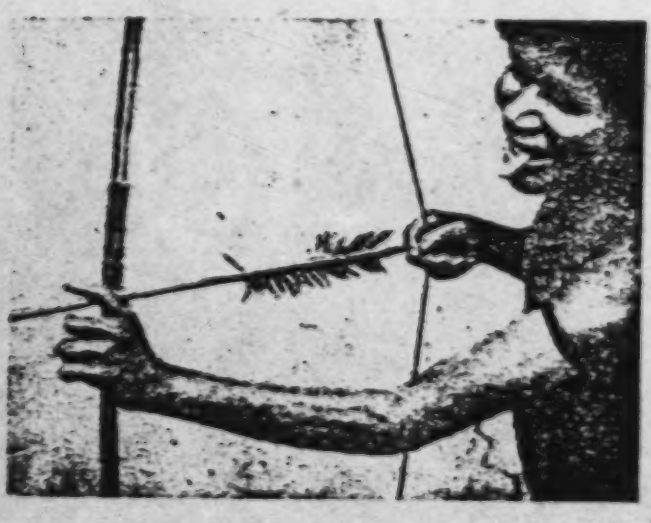
302
316

Cocozu Nambicuara

411
301



Nambicuara Indian stringing his bow.

535 Anunze and Uintaçu tribes participated; and a festive dance in which we took part, executed in our honor at Três Buritis by the Tagnani and Tawite.

The war dance filmed in Campos Novos was later also [253] performed by the Tagnani in Três Buritis.

Armed with bows and arrows, the warriors form a line some 15 meters from a piece of wood which represents the enemy, singing in two-part time and marking the beat on the ground with their feet. [Fig. 25]

Two Indians leave the line, arrows ready and bows half strung, and walk as if cautiously hiding among shrubs in the bush. After a wide detour they come near the "enemy" and hurl their weapons at him.

This is the signal to attack; the singing ceases and a rain of arrows falls on the "unfortunate victim"...

411 Then they advance upon him and give him a thorough drubbing
324 with their bows or with sticks. Incidentally, this is always the func-
726 tion of the arrow--to immobilize the enemy or game and permit the attacker to come close and finish his work with blows. In the hunt or in combat, attack is always made from ambush. This is because the aim of the Indians at a distance [Fig. 27] is not as sure as generally supposed. The Nambicuara are not especially good archers. They certainly cannot draw the bow with their feet like the Bororo. Some can shoot well in height. They use no shield whatever either in the hunt or in war. After the attack they try to recover their projectiles. An arrow represents a certain amount of labor and must not be squandered...

They hold a number of arrows in their left hand and shoot them one after the other with incredible rapidity.

535 Men, women and girls participated in the festive dance.

A large circle was formed to the sound of an endless chant. The women stood on the men's left; pair after pair were joined until the circle was closed. [254] Each man placed his hand on the shoulder of the woman next to him. Within the circle, three girls of approximately the same age accompanied them in a close line, eyes lowered, hands crossed upon the chest. The girl in the center acted as a hub for this choreographic formation... [Fig. 43]

194
197

it reached the Chaco region, where they would thus appear to have lived at an earlier time. (See Krause, op. cit.)

On the other hand, as already pointed out elsewhere, the Nambicuara seem to have received this cultural influx by way of a different route--probably through the other channel of sub-Andean cultural expansion described by Nordenskjöld, which ran from northeastern Bolivia down the Amazon and La Plata watersheds. (Nordenskjöld, op. cit., Vol. 1).

(H. A. T.)

This is perhaps where the problem becomes most difficult: although Ehrenreich places the Xingo Indians alongside the Ge, other experts on South American linguistics believe, perhaps rightly, that they should be included with the Caraja in Chamberlain's "Carajan" group. (2)

2. Krickeberg, Rivet, and other experts still place the Suya among the Ge.

[Fig. 83]

Yet it is also inevitable to recognize in the Nambicuara language certain special characteristics of the Kiriri tongue. These traits are exclusively phonic, and [thus much less significant than if they were lexical or morphological.

[267] They merely consist of the tx, tz and kr sounds, which are accepted as peculiar to the Kiriri language (Baptista Caetano).

In the absence of well translated texts, it is impossible to delve more deeply into the study of these dialects. Even the relationships suggested above will be subject to revision when more complete linguistic materials become available.

411 As regards the [National] Museum collection, the following data are worthy of note.

The bows of the Serra do Norte Indians (hukicú) are made of ipê (1) wood and are very long, measuring from 1.70 to two meters;

1. [In this region, the term covers] trees of the Tecoma and Jacaranda genuses, Bignonia family. The forest variety is I. copaia, D. Don; the field varieties comprise the yellow type (T. ochracea, Mart.) and the purple or black kind (T. ipê, Mart.). (A. J. de S.)

the section is semi-circular. Of all Brazilian tribes, only the Catukina of the Purus River coil the twine around the weapon in a similar way. The cross-section of the Catukina bow, however, is quadrangular.

[Fig. 54]

We made an experiment to determine the approximate strength required to lend a bow the necessary power.

The bow we used measured 2.38 [sic] meters in length by 0.047 meter in its greatest width; its tucum cord [268] had a diameter of 0.002 meter. To set in this bow a fifty-centimeter arrow required 68 kilograms of dynamometric traction.

The [Serra do Norte] Indians use the Mediterranean release (Morse's fourth method): bow vertical, arrow resting against the left edge of the bow and held at the base between the index and middle fingers of the right hand.

In the Americas, this method is peculiar to the Eskimo; the "Redskins" employed another. In Brazil, no [other] tribe uses it as far as I have been able to ascertain; [269] for the most part, our Indians use the third method outlined by Morse.

[268] [Brazilian bows fall into the following categories listed by Hermann Meyer: 1) Peruvian; 2) Northern Brazilian; (1) 3) Guiana;

1. Semi-circular cross-section; dark red, smooth wood of a leguminous tree.

7;Roquette-Pinto--53A E-4, 5 (no date)1938 SP17 Nambicuara SP17
(ca. 1912)

Fig. 56. Uaeliçú--Bamboo-tipped arrow.

[271]

Fig. 57. Aie-uiçú--Serra do Norte arrow.

4) Chaco; 5) Eastern Brazilian.]

Nambicuara bows must be placed in the second group on account of their cross-section, which is indeed quite similar to that of Mundurucu bows. Their twine is coiled in the manner of Meyer's Perutypus group.

[Plates p. 248]

[271] [Fig. 58] Meyer classifies Brazilian arrows into seven groups, now insufficient because other types have since been found, but which nevertheless cover the principal characteristics of our arrows. His classification is based on the feathering of the shaft. [1) Eastern Brazilian or Tupian-Ge; 2) Guiana; 3) Xingu; 4) Arara; 5) Mawe; 6) Peruvian with fibers; 7) Peruvian with resin, where Nambicuara arrows belong.] This last group is further divided in two: a northern division covering the Amazon Valley, and a southern division covering the Chaco region. The feathers are slit lengthwise, their stem scraped until only the outer layer remains; [272] they are tied spirally to the shaft by means of twine and black resin.

[Fig. 55]

Our collection includes war, hunting and fishing arrows. It must be noted, however, that these distinctions are not always maintained; when necessary, the Indians use all three types interchangeably.

Anitçú: The tip is of red wood, cylindrical, smooth; used to hunt monkeys.

[Fig. 56]

Uaelitçú: The tip is sharp, made of taquaruçu bamboo (Merostachys sp.); used in war and to hunt large game--capybara, tapir, jaguar. . . . .

Aieuinçú: The tip is smooth, with a barb at the end.

[Fig. 57]

[273] Arukirikatçú: A unique type, armed with a series of barbs secured with twine and pitch. It is coated with a black substance which the Indians believe to be poisonous; for this reason, they protect the tip with a bamboo sheath. It is a war weapon. The "poison" of Nambicuara arrows is harmless... (1)

1. [Alvaro Osorio de Almeida notes here that he carried out an

411
278

experiment with the resinous, supposedly poisonous substance found on the tip of one of these arrows. He injected a concentrated solution of it into frogs and guinea pigs, and the only resulting symptoms were muscular twitchings, unsteady gait, and some salivation.]

[Fig. 60]

411 Aieraçú: The tip is blunt; it is used to stun birds that are to be caught alive or free from blood, which stains the feathers. [See fig. ... (59), p.55A] Often a smooth tip wrapped in a straw pellet is used for the same purpose.

[227] [274] Some unique fishing arrows have a double, triple or quadruple tip and a bone barb. [See fig. ... (37), p. 36B.] Some have feathers at the base, others do not. . . . .

All Serra do Norte arrows have shafts made of thin bamboo. The various parts of the weapon are secured with strips of the strong [324] imbé liana (Philodendron imbe, Mart.).

[Fig. 61] The clubs are extremely crude weapons of attack and defense, mere portions of thick branches cut when the occasion demands it.

[324] [275] The axes of chipped stone are uniform in type. They are wedge-shaped, made of diorite, and they average two kilograms in weight. The handle is a piece of creeper stem, perhaps from a Bauhinia. The pitch and cord used to fasten the stone make the tool surprisingly strong. . . . .

381 The pitch is made of mastic resin, jatai (Hymenea stigonocarpa [324] or H. stilbocarpa), and wax, as well as other unknown substances. It is placed in pots and subjected to the action of fire, then kept in pellets fastened to embira strips or in loaves wrapped in leaves. Both the arrow "poison" and the axe pitch are called by the name of duhutaarú, which means "wax."

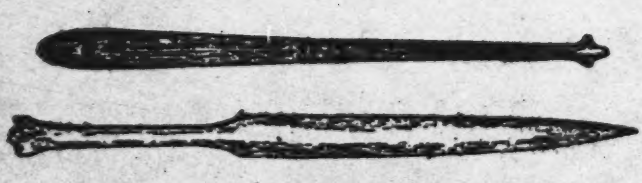

Fig. 61. Clubs found among the Serra do Norte Indians.

/215 cont./

278 Curare of the Ñambikwara of the Rio Juruena

The technique of the Ñambikwara of the right bank of the Rio Juruena is more primitive.

They use only bark which has just been gathered. The draining off of the bark is done only once and with warm water: the bark /216/ is put on the fire in a rather large amount of cold water, and the operation is ended when the temperature reaches 37° to 40° /centigrade/. It is filtered quickly by squeezing the bark with the hands to extract all the liquid from it. Then comes rapid boiling over a high fire and skimming. After several minutes of a rolling boil the fire is lowered and the liquid kept at a temperature a little below boiling until it has a pasty consistency.

[415] [237] The curare is kept in paste form in bamboo tubes or changed into a very hard mass by the addition of meliponine beeswax.

This method exposes the curare to strong heat for at least two hours. The Çabanè method reduces this time to ten minutes, the other operations being carried out at low heat. Both produce curares with about the same activity.

[192] [411] The Rio Juruena Ñambikwara call curare and the plant a'utĭsú or a'ukisú; the roots ta'ădisú; the poisoned arrow aurú kiritkatsú, and its protective bamboo sheath asirikatsú.

Utilization of Curare

278 411 The Ñambikwara are not familiar with the blowgun. They use curare to poison large arrows with long, notched points, capped with a protective bamboo sheath. The points of the Tamandé curare arrows are shorter and more slender than those of the other Ñambikwara. They are usually placed in twos, threes, and fours under a single protective sheath.

According to the Indians an arrow's activeness does not last more than three or four months. The curare in paste form is kept for a longer time (close to a year). Hard curare can be kept for years.

/216 cont./

224 The poisoned arrows are intended for hunting certain ani-
278 mals, some large birds, cervids, and especially monkeys.
411 Birds wounded by one of these arrows fall almost immediate-
[203] ly.

A monkey mortally wounded with an ordinary arrow or even a bullet often remains hanging from the branches. Under the action of curare it holds itself immobile at first, then begins to tremble and falls several minutes later (five to 10 at the most) as soon as paralysis is produced.

A peccary or small deer such as the Cervus campestris wounded in the body runs for one or two minutes, then stops exhausted, is attacked by tremors and lies down.

The tapir, very large, resists a long time; it can run for two hours before stopping; hence the Indians do not hunt it with curare.

[262] /217/ The meat of animals killed with curare may be
[252] eaten without harm; the Ñambikwara of the Juruena content themselves with cutting away the flesh around the wound impregnated with poison and colored yellow; the Çabanè do not even take this precaution.

278 Poisoned arrows are also used for war; this is perhaps their
411 principal object among many Ñambikwara groups, who possess
726 only a very few specimens during normal times.

None of the Indians know of an efficacious antidote. According to our informants wounds in the trunk would always be fatal to men. By immediately drawing out the arrow, it might be possible to survive a wound in a limb; in order to make their extraction more difficult, the points of the poisoned arrows, especially those of the Çabanè, are very lightly attached to their shafts.

For about seven
221 months these bands go wandering across the prairie in search of small
[222] game, small animals such as caterpillars, spiders, grasshoppers, rodents, snakes, lizards, and so forth, and fruits, grains, roots or wild honey—in short, all that might keep them from dying of hunger. Their camps, set up for one or several days, sometimes for several weeks, consist of as many temporary shelters as families, made of palms or branches stuck in a semi-circle in the sand and connected at the top. This is the period when the quest for food absorbs all activities. The women equip themselves with digging sticks, and
221 411 184 the men hunt with the bow and arrow, of which several types must be distinguished. The eastern groups have a bow with a flat section which evolves toward a convex-plane section or a concave-convex section when one moves westward. As for the arrows, those made for hunting birds have a blunted tip. Arrows for fish have three to five points, each one formed like a minute harpoon, and the stem is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 95.

by a sheath of bamboo, are reserved for hunting monkeys and small game. Those for large game have a long lanceolate point. The barb is attached or sewed on. Besides the bow and arrow, the men use a club
[789] which often takes the form of a javelin, and its use is reserved for magic and war operations (1).

1. Cf. below, p. 99.

824 The primary materials of the indigenous industry consist of varied
825 woods, wax from wild bees, resin, fibers of the buriti palm trees (Mauritia vinifera) and tucum (Astrocaryum tucuma) bone of the monkey, teeth and claws of mammals, fur (only to make ornaments), feathers, quills of porcupines, vegetable shells and river shells, stones,
● 412 cotton and grains. As implements they have knives made from a sharp piece of bamboo, from stones crudely fashioned, or from fragments of iron or steel obtained through exchange, and fixed with the aid of wax and cord between two pieces of wood forming the handle. Drills are made of a borer of stone or iron mounted at the end of a stick
[77] which they turn between their palms. The Rondon Commission expanded the use of axes and metal hammers, and the old stone axes serve now only as small anvil blocks for fashioning shell or bone.
[415] The use of stone polishers must also be mentioned and, among the objects of current usage, the spindles, combs, baskets and gourds to carry water.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life.

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard.

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton.

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string.

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the *"Arawak"* type (pl. 37, *center, right*).

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour.

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark.

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood.

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the

224 with them and informs the flanking hunters with bird calls. When completely surrounded the flanking parties drive the pigs back against the central group where the best archers are stationed. As the pigs charge back, they are shot at close range. Usually an arrow will stop a peccary so that it can be killed later with a club. If the hunters are well organized very few peccaries escape.

252 The hunters then open up all the pigs and take out the viscera. The entrails are emptied and [264] along with the heart, liver, etc., are thrown on hot coals to broil and are eaten on the spot. [412] When opening an animal the hunter grasps a handful of skin over the belly and cuts it off with a bamboo knife leaving a round hole through which the viscera are drawn out. After everyone has eaten, the carcasses are carried back to camp where the meat is cut up and shared among the families, the man with a large family getting more than one with a small family even though the [251] man had not shot anything. All meat that cannot be eaten in a day or two is cut up and dried.

224 The Nambicuara now have a few dogs which [231] they use when hunting jaguars. The dogs drive the jaguar into a tree where it can be shot with a gun or with arrows. Sometimes a wounded jaguar will attack the hunters, and injuries occur. Marciano's 6-year old son had his head and face clawed by a wounded jaguar which his father was not able to kill with the first shot of his shotgun.

Armadillos are dug out of holes. The soil is first loosened with a stick and then dug with a gourd, the diggers sometimes having to go as deep as 8 feet. When they get near the armadillo they put a long stick under it and force it up against the top of the hole in order to prevent it from digging further. When near enough a man reaches into the hole with his hand and pulls out the armadillo. If the hunters are very hungry [264] they will roast the armadillo on the spot, taking left-over pieces of roasted meat home to their families.

224 Although sharing is the custom, and it is amus-
264 ing to observe several men sitting around a 6-inch lizard to eat it, single hunters sometimes succeed in avoiding their obligations. One day as I walked along with Cascudo, followed by several Nambicuara some distance behind, he killed a snake and threw it into the bushes and signaled

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A favorite dish is to crush in a mortar manioc cakes with boiled beans, broiled meat, ants, palm nuts, monkey and bird bones.

As an example of the variety of uses to which the Nambicuara can put a plant we can take the buriti palm: (1) They eat the pulp surrounding the scaly covered nut. (2) They use the fibers from the new growth to make twine. (3) They use the tough, flexible cortex of the frond stalk for making baskets. (4) They fell the buriti so that a certain variety of grub can collect and multiply in the starchy pith in the heart of the tree. The grubs or larvae they then eat uncooked. (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buriti palm has male associations, for only men can prepare its products. When a male child dies a piece of buriti fiber is left over his grave.

The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 18 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick loosens into small smouldering balls. These he places into a handful of dry buriti fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

The material equipment of the Eastern Nambicuara is extremely simple. Many items, such as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small grater and the few gourd vessels, small baskets, and twine, the woman carries

[p. 92(B)]

412 415 in her burden basket, whereas the modern axes, knives, and other tools, along with his ornaments, the man carries in a similar basket, or he straps this basket on the back of a boy while he walks in front of the file carrying his bow and arrows or gun ready to shoot whatever game is met along the way. Whenever they kill some animal or [264] catch a few fish and feel hungry they stop and prepare a meal. During the dry season they are at home anywhere in their band territory, moving only when hunger spurs them on.

411 412 177 Today, of course, the Nambicuara have steel axes and knives. The heavy equipment of the Waklítisu band in 1949, consisted of three axes, two shotguns, and some half dozen hoes which were hidden near their permanent house. Each man had a butcher knife, but all men did not have bows and arrows. There did not appear to be any desire on the part of each man to possess these implements. So long as the band had a few of these objects everyone seemed to be satisfied. Cascudo, a widower when he arrived in Utiarity, did not possess a bow and arrow, nor a gun, nor an ax. By working for the Protestant missionaries he acquired an ax and when Marciano died he inherited his bow and arrows. After a [439] few days, however, he had given the bow and arrows to a Brazilian in exchange for a felt hat.

412 Examining the hand tools which Julio used, the following articles were found: A chisel (*kwatíru*) made by inserting a piece of steel into a wooden handle wound with twine; a small bamboo [306] knife (*alkúkwirikatu*); a hardwood drill (*Mskatu*), used with sand for perforating tucum nut shells in making beads; a piece of sandstone (*ddligisu*), used as a whetstone; a number of rough leaves of the lixeiro tree (*kle'énatu*), used as sandpaper; and a 415 comb (*ha'dlatu*). Each of Julio's three wives had a burden basket, a small square basket, and two or three gourd vessels of various sizes. A single wooden mortar and pestle did service for the whole band.

411 One of the most important implements of the Nambicuara is the bow, *húkisu*, made from the piuva (jacaranda-copaia) or the siriva palm (*Syagrus speciosa*). By far the most common is the bow made from piuva, ranging between 6 and 7 feet in length, flat on the inside and convex on the outside. One of the bows examined measured 2 meters and 14 cm. in length, 4 cm. in width, and 1.5 cm. in

[p.93(A)]

a dois. As cestas de carga têm grande capacidade e são feitas de taquára. Os seus laços são fixados no fundo e nas paredes lateraes, passando pelas axilas e pelas espaduas de la india portadora.

Os Nhambiquára fazem ceramica de uma pasta grosseira, negra e mal cozida, na qual se acha a arjila misturada á grande porção de cinzas (Fig. 2).

[323]

FIG. 2.—CERAMICA DOS NHAMBIQUÁRA.
[Nambicuara pottery]

Para derrubar as arvores do terreno destinado á cultura, uzam do machado de pedra (diabaze) fixado em um cabo de madeira, por meio de cordeis e breu (Fig. 3). O indio que consegue deitar abaixo certas arvores com este instrumento, recebe como premio uma bella pena de arara ou mutum (*Crax globulosa*), que se destina ao nariz. Esta especie de condecoração conferida por trabalho industrial é tanto, mais notavel quanto, em geral, taes distincções, entre os selvagens do Brazil, são reservadas ao merito guerreiro.

Os arcos geralmente muito grandes, muito fortes, de madeira vermelha, são muito bem alizados. A sua secção transversal é semi-cilindrica. Seu comprimento varia, nos que existem na coleção, entre 1 m. 80, e 2 m. 38. Para obter uma flexa de 50 c. entre a corda e o arco de 2 m. 38, em experiencia feita, precizámos uma força de tração correspondente á 60 k. verificados no dinamometro. A corda é de tucum (*Astrocaryum tucum*), e tem um diametro de 2 mm.

[313 412]

FIG. 3.—MACHADO DE PEDRA (DIABAZE) PARA DERRUBAR ARVORES.
[Stone axe for felling trees]

As flechas destes indios têm aspétos diferentes e pódemser caracterizadas pela fórma das pontas, segundo 5 tipos (Fig. 4).

O primeiro tipo tem a ponta de madeira vermelha, inteiramente lisa e cilindrica (Fig. 4, *e*); o segundo se caracteriza por um pequeno aculeo fixado á ponta, dando-lhe a fórma de harpão (Fig. 4, *b*); tem a ponta de taquára em fórma de punhal com cerca de 25 c. de comprimento, as flechas do terceiro tipo (Fig. 4, *af*); as do quarto tipo distinguem-se mui facilmente por ter a ponta achatada, e provida, lateralmente, de 11 pares de farpas. As mais curiosas das flechas dos Nhambiquára são as do quinto tipo (Fig. 4, *cd*). Sua ponta tem farpas fixadas por meio de fios de

5:Roquette-Pinto E-4 (no date)1913 SP17 Nambicuara SP17

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéra, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákorê and Ouihanierê to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guaycurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoákorê, and who, as now stated, are Nhambiquára. This name of Uáikoákorê is given by the Parecí of the sub-tribes Kaxinití and Uaimaré of the rivers Arinos, Sacuriú-iná, Tahura-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Cabaçal and Jauxú. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of coconut. They wear armlets, bracelets, leg ornaments and bead collars made from the fruit of the mbacába. They live by the chase, but also plant maize, yams, potatoes, mandioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atzíri and the Amúesa of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kêtêhê of the Parecí, made from pounded mandioc. The native *breu* or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Oanini and wax, and is preserved in leaves of the Malá-malá palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutúm feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 38 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malá-malá and breu. The upper disk has three orifices.

● 412

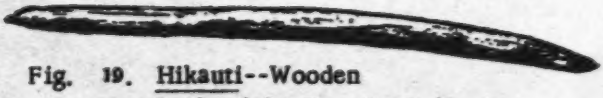

Fig. 19. Hikauti--Wooden knife of the Tawaite Indians.

342 The external layers cover the whole building, like very precise and well clipped sheets of straw. The side walls are not distinct from the roof, but mere extensions of it.

Of the two houses we have described, in the village close to the Carumi (or Festa da Bandeira) River, the larger covers 30 meters in circumference, the other 28. Their doorways measure 0.37 meters in width by 0.52 meters in height. These two houses stand on a plaza some twenty meters in diameter.

352 Inside the huts stand three bamboo grids [giraus] to dry manioc
354 scrapings, and two enormous black pots which could not have come
[252] through the doors; lighter utensils and various other implements, as well as ornaments, are kept in the ceiling thatch. This serves as the Indians' closet, where they hide their smaller belongings. [Fig. 24]

354 A small fire burns underneath each grid.

These grids were made up of four bamboo stalks sunk into the ground and supporting a horizontal grate of small bamboo reeds. They measured about two meters in length by one and a half in width.

The huts are not equipped with any smoke holes, and none are needed. The smoke of inside fires filters easily through the interstices of the thatch.

356 Around the dwelling, scattered or in heaps, lie disjointed bones, fragmented coconuts, pods of the jatobá bean, corn cobs, charcoal, and food refuse, mixed with worn-out tools and utensils.

412 In the village on the Festa da Bandeira River, I found beside a house a large object which I only failed to bring back because it would have been absolutely impossible to transport it. It was of a kind commonly found in the sambaquis [224] of the Atlantic coast: a rock pitted with several depressions large enough to hold a fingertip. To
[222 one side lay a prodigious quantity of small bacaba nuts, both shelled
262] and unshelled. It has often been inferred that this implement was used to produce fires, but in the Serra do Norte it merely serves to shell palm nuts. This stone, however, was much larger than those generally encountered in the sambaguis.

342 The temporary shelter consists of a screen of leaves and branches. The Indians may use it for a few days if hunting in the area is good; then they abandon it.

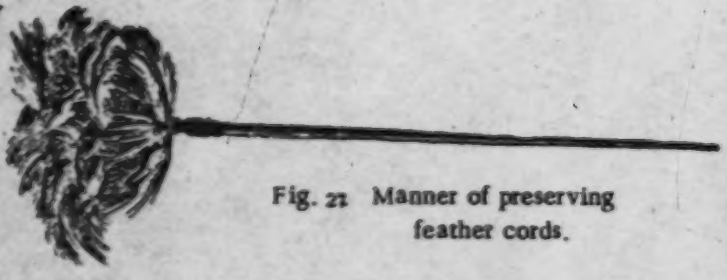

Fig. 21 Manner of preserving feather cords.

Çabanè

/214 cont./

278 Only the bark of the roots impregnated with a reddish,
824 gummy juice is used in the preparation of curare. The plants which grow in sandy places are considered to be richer in poison; they are recognized by the bright red color and moisture exuding from incisions made in the bark. Roots from clayey earth are dry and considered incapable of giving an active product.

The Nambikwara of the Juruena consider it essential to gather the roots in the morning at dawn before the sun gets too hot, and they only use fresh bark. The Çabanè use dried, stored bark by preference.

Çabanè Curare

278 The preparation of Çabanè curare may be taken as typical. It comprises three main operations: draining of the bark in portions with fresh water; rapid boiling to rid the product of some of its impurities; slow concentration at low heat.

[illegible] Immediately after their harvest the roots are washed and then scraped with a splinter of bamboo or a piece of iron to detach the bark. Small, very fine shavings are thereby obtained which are dried and kept in baskets or gourds.

[illegible] Draining of the bark. The bark is placed in a small, elongated basket (kɔnɔ̨simatá) of bamboo lamellae reinforced by large leaves (kɔnɔ̨kɔnɔ̨sí) and hung by two vertical supports over an earthen dish. Over the bark they pour 200 to 250 cubic centimeters of cold water; a blood-red liquid filters off slowly. The filtering takes 15 to 20 minutes; when it is almost over fresh water is again poured over the bark. This operation is repeated six to eight times until the bark is exhausted (Pl. IV, A-B).

[illegible] Boiling on a brisk fire. After each operation the liquid obtained is poured into a receptacle placed directly over a strong fire; it is constantly /215/ stirred with a wooden spatula and does not take long to boil in large bubbles. When it

/215 cont./

278 threatens to overflow it is removed from the fire for a second and then put back to boil. A thick, reddish scum forms which [414] holds the largest impurities; it is removed as it appears with a straw from a palm tree (Pl. V, A). After five to ten minutes on an average the boiling diminishes; the liquid turns brown [415] and begins to thicken. It is then taken from the fire and poured with the aid of a funnel (kõ̤li) made from a rolled leaf into a new receptacle to be concentrated (Pl. IV, C).

[416] [172] Concentration. The concentration is done in a receptacle (here, a tin can from the mission) suspended 40 or 50 centimeters above a small fire, into which successive portions of liquid are added as they are prepared. The concentration takes two to three hours. According to its degree /of concentration/ they obtain a thick blackish-brown liquid, reddish when looked through, ready to be applied to the arrows with a straw, or a black paste which becomes very hard on cooling and can be kept for a long time. Before being used this paste must be softened at low heat.

The Çabanè recommend that one not touch the curare with the fingers nor even breathe the steam from it during the boiling. This hypothetical toxicity of the steam had already been noted by former travelers; it was even asserted that these emanations were so dangerous that the Indians had the curare prepared by old women who almost always succumbed to it. One can see (Pl. V, A) that the Çabanè sorcerer is not afraid of it.

Curare does not enter healthy skin; and the Ñambikwara of the Juruena press the water-soaked bark between their hands, taking the sole precaution of washing immediately afterward. The steam that I voluntarily inhaled never caused me the least sickness.

[172] The Çabanè call curare and the plant which produces it irĩwa, and the still unconcentrated liquid from soaking iriwiya. The Tagnani name the plant and the curare naĩdẽ̤.

361 The circular spot formed by the village grounds in the middle of the bush gradually acquires the appearance of a star, owing to the paths that lead out from its circumference.

[712 413] Access to the village grounds is free. There is no fence or hedge to prevent admittance to the plaza; no fortifications or other defensive features are to be found in the vicinity. (1)

> 1. The Tupian Indians of the Gi-Paraná, on the other hand (like the Tupinamba of old and other [tribes]), obstructed the paths leading to their villages with spikes [estrepes] which had to be removed when they established relations with the Rondon Mission. (See Col. M. Rondon, Conferencias [Lectures], pp. 161-162.)

Nambicuara villages always consist of two houses, which are set face to face at opposite ends of the plaza.

[137] [220] The region consists of extensive forests, stretches of scrubland [cerrado], areas of nearly impenetrable bush [charravascal], and a few stretches of open prairie. The Indians prefer the scrubland as the site of their villages.

The forest is dangerous on account of snakes, wild beasts, and even timber which often crashes down on the hunters; the prairie is dangerous because it exposes the village to enemy attack and does not afford any protection against invaders. But the scrubland serves the purpose very well; it has few disadvantages and many advantages.

342 This the Nambicuara know well: their hut blends into the greyish hues of the surrounding vegetation; it is like a shrub among other shrubs; from a distance it can hardly be distinguished. Its shape, though well defined, merges into the vague forms of the bush.

Naturally, those whose eyes are accustomed to the dust-veiled mass of xerophytic upland vegetation can quickly spot the huts; the illusion cannot deceive an experienced eye. But the mimicry is nevertheless real.

413

Fig. 41. Surgical instrument of the Serra do Norte Indians.

For a[illegible] seven
221 months these bands go wandering across the prairie in search of small
[222] game, small animals such as caterpillars, spiders, grasshoppers, rodents, snakes, lizards, and so forth, and fruits, grains, roots or wild honey—in short, all that might keep them from dying of hunger. Their camps, set up for one or several days, sometimes for several weeks, consist of as many temporary shelters as families, made of palms or branches stuck in a semi-circle in the sand and connected at the top. This is the period when the quest for food absorbs all activities. The women equip themselves with digging sticks, and
221 411 184 the men hunt with the bow and arrow, of which several types must be distinguished. The eastern groups have a bow with a flat section which evolves toward a convex-plane section or a concave-convex section when one moves westward. As for the arrows, those made for hunting birds have a blunted tip. Arrows for fish have three to five points, each one formed like a minute harpoon, and the stem is without barb. The poisoned arrows (1), whose tip is protected [15]

1. See below, p. 95.

by a sheath of bamboo, are reserved for hunting monkeys and small game. Those for large game have a long lanceolate point. The barb is attached or sewed on. Besides the bow and arrow, the men use a club
[189] which often takes the form of a javelin, and its use is reserved for magic and war operations (1).

1. Cf. below, p. 99.

824 The primary materials of the indigenous industry consist of varied
825 woods, wax from wild bees, resin, fibers of the buriti palm trees (Mauritia vinifera) and tucum (Astrocaryum tucuma) bone of the monkey, teeth and claws of mammals, fur (only to make ornaments), feathers, quills of porcupines, vegetable shells and river shells, stones,
412 cotton and grains. As implements they have knives made from a sharp piece of bamboo, from stones crudely fashioned, or from fragments of iron or steel obtained through exchange, and fixed with the aid of wax and cord between two pieces of wood forming the handle. Drills are made of a borer of stone or iron mounted at the end of a stick
[177] which they turn between their palms. The Rondon Commission expanded the use of axes and metal hammers, and the old stone axes serve now only as small anvil blocks for fashioning shell or bone.
[415] The use of stone polishers must also be mentioned and, among the objects of current usage, the spindles, combs, baskets and gourds to carry water.

593 The conversation becomes animated and laughter spreads. In the dark
182 prairie the camp fires burn. Around the fire, the only protection
462 against the cold which descends, behind the frail windbreak of palms
[342] and branches hastily planted in the ground on the side where wind or
[415] rain is expected; near the baskets filled with poor objects which constitute their whole earthly treasure; lying on the ground which extends around, haunted only by other bands equally hostile and fearful, the couples, embracing tightly, are truly seen as the support of one another, the comfort, the only help against the daily difficulties and the dreamy melancholy invades the Nambikwara soul from time to time. The visitor who camps in the brush with the Indians for the first time feels tenderness as well as anguish and pity before the spectacle of this humanity so completely unprotected; crushed, apparently against the soil of a hostile land by some implacable cataclysm; naked, shivering around the hesitant fires. He circulates tip-toe among the underbrush, in the dark, avoiding crushing in his walk a hand, an arm, a trunk, whose warm reflections are seen by the light of the fires. But this misery is animated by whispering and laughter. [56] The couples clasp one another as in the nostalgia of a lost union. Their caresses, at the same time tender and candid, are not interrupted by the passage of the stranger. One senses in all
[57] of them an immense gentleness, a profound carelessness, a naive and charming animal satisfaction, and, emanating from all that, something like the most moving and credible expression of human tenderness.

593 Thus it is not surprising that the attitude of the two sexes as con-
831 cerns one another is characterized by intense interest. This interest
462 is translated in certain cases by the vocabulary. In fact the Nambikwara
562 have only one word to express "pretty" and "young," and a single word to
[517] signify "ugly" and "old" (munɨ̨ene, jeʔene, bl). Their esthetic judgments are thus based essentially on human considerations, and above all, sexual ones. But the interest which is manifested between the sexes is of a complex nature. Men judge women in a mass, as being a little different from themselves. Depending on the situation, they consider them with desire, admiration, or tenderness. In itself the confusion of terms pointed out above constitutes permanent homage. But it must not be forgotten that the form of economic adaptation realized by sexual division of labor a capital role attributes to the women, since family life rests to a very large degree (probably the greatest) on the collecting of the women, but it represents an
[83] inferior type of activity. The ideal life is conceived on the model of agricultural production or hunting. To have plenty of manioc, and

622 and oxen for carrying could pass. The provisions of manioc proved to be insufficient and one morning the little band found itself without anything to eat. Our own attempts to kill some animal were in vain, and the worst [88] bad humor began to reign, the chief of the group being obviously held responsible for an affair which we, he and I, had contrived. In place of undertaking a hunting or collecting expedition, each one decided to go to sleep in the shade of shelters, and they left the chief alone to find the solution to the problem. He disappeared, accompanied by one of his wives (his first wife a2, 622 contrary to usual procedure; but a3 and a4 shared the general irrita- 416 tion) and toward evening both were seen reappearing, their heavy baskets filled with grasshoppers which they had spent the entire day [262] catching. Although grasshopper pie is not a particularly esteemed dish, everyone ate with good appetite and found his good humor again. They took up the journey again the next morning.

But other things than these exceptional relief measures are expected of the chief. He must sing and dance willingly and well, and be capable of animating the collective life. He must organize the work in the most reasonable way in order to eliminate useless fatigue and effort. Thus on the eve of a departure, B1 recites for us his order of march:

30. mãdɔ́rige mãdohaʔdhudne haitehãdige nãnjehnile
ɰietnonaʔnahara jãuehara kanahaniʔndeere hinkɔ́naha
iinɨ́amnjẽ ʔkeena iinãmnjẽ ihikɔ́ro ihikɔ́ro. (b1)
When it is hot, one is tired, one is hungry, the
children walk badly; when one marches at dawn,
one marches well, at dawn, one should march, change
routes, march; on the way! on the way!

He must also win over his companions by numerous gifts. According to B1, who gives in willingly to the servitude of power, generosity plays a fundamental role in determining the degree of popularity which the new chief will enjoy, and the companions indulge in all sorts of speculations:

31. ɰilikã̃ aheni ʔinire tunun ʔentutnɨɰilikã̃ agnhaʔhare
tunũriani (b-1)
The chief is leaving; the one who will come will give me
a great deal. --"Chief! Be generous! Give to me!"

The presents thus anticipated consist of food or objects which the chief will have made himself with the assistance of his polygamous wives, or that he will have procured by good exchanges with neighboring bands, or which might come from war booty. Often, it seems,

721 Excitement and enthusiasm decline, and the group returns home.
But some are pushed until realized, [95] and can be very murderous.
726 The Nambikwara usually attack at dawn and extend their ambush by
dispersing throughout the bush. The signal for attack is given from
[534 202] place to place, thanks to the whistle which the Indians carry hanging
from their necks. This little whistle, composed of two bamboo tubes
[136] tied with cotton thread reproduces the cry of the cricket approximately,
and doubtless for that reason has the same name (kalõde) as this insect.

MAGIC, RITES AND RELIGIOUS BELIEFS

278 Some beliefs of a magical and religious character also play
[771] their role in social life. The most important is the notion of
nãnde (bl). To analyze it, we should first say a few words con-
cerning poisons. The Nambikwara are very expert poisoners. They
make curare for their arrows, or at least for some of them, pre-
● [415] served in little earthen pots. (1) Without enlarging here upon the

1. The study of the Nambikwara curare was made, on the occasion of our expedition, by our friend and companion Dr. J. A. Vellard. Cf. Vellard, "A preparacão do curare pelos Nambikwaras," Revista do Archivo Municipal de São Paulo, LIX, 1939, p. 5-16; "Communication à l'Académie de Médicine de Paris," id. LVIII, 1931, p. 117-118.

manufacture of the curare, it must be noted that this preparation, although reserved for chiefs and sorcerers, is not surrounded by any ritual and does not give rise to any magical operation. The Indians make the curare publicly, applying recipes and taking precautions which are either essential to the effectiveness of the product or which constitute simple prejudices, but all of which have a positive character. Their attitude towards this poison thus may be considered as scientific. Along with curare, the Nambikwara know other poisons likewise of vegetable origin, and which take the form of powders
[415] contained in small tubes. These are made of quills, feathers, or stalks of bamboo or other wood, cleaned out and corked at both ends with a piece of vegetable pith or cotton, and sometimes decorated with red dots and lines made with urucu paste. (2) These tubes are

2. Cf. Rondonia. Roquette Pinto collected examples of these tubes and reproduced one of them (Rondonia,

278
●[415]

p. 239 and Fig. 34), but seems not to know their usage nor the nature of their content.

usually tied in bundles of two or three or more, and thus all the Indians possess a provision of poison from which they rarely become separated. We were not able to find out anything concerning the preparation of these drugs, but it seems that different varieties exist, used either by men or women. Notably, the poisons whose small doses are contained in the feather quills would be [96] according to an informant, women's poisons, and also much more to be feared. The "tube poisons" (as compared with the arrow poison which is only employed for hunting, and never for war) play an important role in inter-individual relationships. They are the usual instrument for amorous or commercial vengeance. To define these poisons, there are special terms according to dialects. Thus the arrow poison has a special name: inãru (a1); dãdnesu (a2); tiĩre, nãnde (b1); ãĩrare (b2); iriụã (c). But all of the arrow poisons and tube poisons are called by a more general term, belonging to dialect b1, but which is understood and used by all the groups: ĩãnde, which one might be wrongly tempted to translate as poison. It must be noted, however, from now on that in the case of tube poisons, the term nãnde means the tube and its contents simultaneously.

789 However besides these "true" poisons which we shall call scientific, there are other substances whose supposed action is of a purely magical character. Certain tubes contain, not a powder meant to be mixed with food, but fragments of resin of the tree called "barrigudo" or [824] "barrigudeira" in Portuguese (Bombax ventriculosa) and sahãrudĩtããru (a1/2), irĩdare (b1), iakĩụa (c) in Nambikwara. These fragments are used for certain "magic projections" which are carried out in the following way: a fragment of resin is placed between the lower edge of the palm of the left hand, held horizontally, and the tip of the index of the right hand held vertically (position called iuuehãre [a1]). By exercising strong pressure of the finger on the edge of the other hand, the index trips and throws the small projectile as far as several meters (asatããkedjuzu [a1], adãmdige [b1], ndãmdige [b2]). It is believed that the person reached by a fragment thrown in this way will become like the trunk of the barrigudo tree, narrow at the base and at the top and bloated in the center. He will fall ill, his stomach will begin to inflate, and finally he will die. This method of throwing is also often used for teasing, especially children, and to bombard an adversary with small fruit, with pieces of dirt,

clude at least one stretch of river and the "galeria" forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. Within this hunting territory they have camping places rather than villages. A semipermanent camp site where fields are cultivated for 2 or 3 years is known as *sinoidesu*. Any place where the band or a family may stop overnight is known as *sidnou*. At present the Wakitisu band has one house (*sisu*) at the place where it is farming. The entire band occupies the house, each family having its own fire around which it sleeps at night. The unmarried men gather around another fire. Julio informed me that their house is rectangular with stake walls and a gable roof covered with sapé thatch. Some years ago when the band was larger he said they occupied a different place on which they built three houses. These houses were built by placing a series of saplings into the ground to form an oval. The tops were then fastened to a ridge pole, the framework being covered with sapé or palm fronds. A smaller beehive-shaped house is made in the same way. Houses of this type are from 6 to 10 feet high. Near the living house they build a small flute hut (*sinoditakisu*) and, when the occasion demands, a shaman's hut (*sikidentsu*).

If the weather is cold while they are out hunting the band or the family may build a temporary brush hut for the night. Sometimes only a windbreak (*siotdutsi*) is considered sufficient. On warm nights during the dry season the group camps under a tree. In favorite hunting places the same camp site will be used repeatedly. When the soil around the permanent camp site or village becomes exhausted, fields are cleared some distance away and small huts are put up for the workers. As the distance increases the old camp site is eventually abandoned and a new camp site is established.

As the Nambicuara do not use hammocks, beds, or seats, there is not much in the way of furniture in their shelters. Utensils are restricted to a few gourd vessels, tin cans, burden baskets and small flat baskets, fire fans, bows and arrows, and tools used by men. When they move, these articles are placed in burden baskets which are carried by the women. The Wakitisu do not

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

252 The Nambicuara method of processing manioc in comparison with that of the Camayurá is simple and crude. The following describes the method used today: Marciano's wife dug up a burden basket full of manioc from a field belonging to the Protestant Mission. She sat under a tree [171] and peeled the tubers with an old butcher knife (formerly a piece of bamboo was used). She washed the peeled tubers and placed them in a calabash. She then took a grater made from a piece of kerosene box about 2 feet long and 6 inches wide to which an 18-inch strip of perforated tin was nailed. She placed one end of the grater in a larger copper basin (belonging to the mission) while the other end rested on the edge, and while steadying the grater with one hand she grated the tuber with the other. The tubers did not stand in water nor were they dipped in water during the process of grating.

After the tubers were grated she dipped out a calabash full of mash and began pressing it with her hands and pouring the juice into another calabash. After she had drained off as much juice as possible she picked up a handful of mash (*wáhaeru*) and rolled it and squeezed it until no more juice could be expelled. This ball she placed in another calabash and continued making balls until the calabash was full. She then patted down the balls to form a round loaf about 10 inches in diameter and 4 inches thick, which she set out on the bare ground to dry in the sun. [251] After several days in the sun these loaves get hard and dry and form the storable product (*hinokónaeru*) from which the edible cake *hi'tsáiv* (also called *wahóaeru*) is baked. The juice (*syduse*) which was left in the calabash she poured into a slight depression in the ground, and after the liquid had drained off she collected the thin film of starch flour (*ahutsáiu*) along with some sand, rolled it into a ball, and placed it in hot ashes to bake. [415] The lack of pottery vessels prevents the Nambicuara from saving and boiling the juice. They know, however, that the juice is valuable, and when they have cooking vessels they boil it to form a thick porridge.

When the Nambicuara wish to prepare a greater quantity of pulp they use a piece of bast for a press. This is a piece of embira bark about 3 feet long and 8 inches wide called *sáva*. A woman rolls a ball of pulp in the strip of bark and twists the bark until the pulp is dry. The balls are then

4: Oberg Σ-5 (1949) 1953
SP17 Nambicuara SP17

subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A favorite dish is to crush in a mortar manioc cakes with boiled beans, broiled meat, ants, palm nuts, monkey and bird bones.

As an example of the variety of uses to which the Nambicuara can put a plant we can take the buriti palm: (1) They eat the pulp surrounding the scaly covered nut. (2) They use the fibers from the new growth to make twine. (3) They use the tough, flexible cortex of the frond stalk for making baskets. (4) They fell the buriti so that a certain variety of grub can collect and multiply in the starchy pith in the heart of the tree. The grubs or larvae they then eat uncooked. (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buriti palm has male associations, for only men can prepare its products. When a male child dies a piece of buriti fiber is left over his grave.

The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 18 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick loosens into small smouldering balls. These he places into a handful of dry buriti fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

The material equipment of the Eastern Nambicuara is extremely simple. Many items, such as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small grater and the few gourd vessels, small baskets, and twine, the woman carries

[p. 92(5)]

412 in her burden basket, whereas the modern axe,
●415 knives, and other tools, along with his ornaments, the man carries in a similar basket; or he straps this basket on the [illegible] in front of [illegible] his carrying his bow and arrows or gun ready to shoot whatever game is met along [264] the way. Whenever they kill some animal or catch a few fish and feel hungry they stop and prepare a meal. During the dry season they are at home anywhere in their band territory, moving only when hunger spurs them on.

411 Today, of course, the Nambicuara have steel
412 axes and knives. The heavy equipment of the
177 Wakitiu band in 1948, consisted of three axes, two shotguns, and some half dozen hoes which were hidden near their permanent house. Each man had a butcher knife, but all men did not have bows and arrows. There did not appear to be any desire on the part of each man to possess these implements. So long as the band had a few of these objects everyone seemed to be satisfied. Cascudo, a widower when he arrived in Utiarity, did not possess a bow and arrow, nor a gun, nor an ax. By working for the Protestant missionaries he acquired an ax and when Marciano [439] died he inherited his bow and arrows. After a few days, however, he had given the bow and arrows to a Brazilian in exchange for a felt hat.

412 Examining the hand tools which Julio used, the following articles were found: A chisel (*kwatéru*) made by inserting a piece of steel into a wooden handle wound with twine; a small bamboo [306] knife (*alkálwa-likatu*); a hardwood drill (*kókatu*), used with sand for perforating tucum nut shells in making beads; a piece of sandstone (*dálipiru*), used as a whetstone; a number of rough leaves of the *kwiro* tree (*kiz'éuatu*), used as sandpaper; and a
415 comb (*ka'dlatu*). Each of Julio's three wives had a burden basket, a small square basket, and two or three gourd vessels of various sizes. A single wooden mortar and pestle did service for the whole band.

411 One of the most important implements of the Nambicuara is the bow, *kálkiza*, made from the piuva (jacaranda-copaia) or the *úiriva* palm (*Syagrus sporioce*). By far the most common is the bow made from piuva, ranging between 6 and 7 feet in length, flat on the inside and convex on the outside. One of the bows examined measured 2 meters and 14 cm. in length, 4 cm. in width, and 1.5 cm. in

[249] Yet a wild form of manioc has been found (Manihot utilissimo, Pohl); if not the very species we use, at least one of the same genus. But maize?

Where on the surface of the earth does maize exist in a wild state except for the tunicated Zea mais which is sometimes considered to be the ancestor of the modern species?

What unveiling of mysteries, if this question were to be answered!

Some Tagnani who were watching the herdsman João Lucas weed a small plot in Três Buritis began to laugh at him, indicating that it would be better to root up the weeds; the hoe severed the stems but left in the roots, and the plants would grow up again. When the Nambicuara weed, they pull out everything that is not useful. Their plots are always clean.

Their tobacco is the Nicotiana that grows wild in their mountains; it may not properly be said that urucu and cotton are cultivated: they are planted and utilized. Some large beans of various kinds de-
278 241 serve mention. [250] They are to be found in the Indians' baskets along with many other plants; but we never saw an Indian eating them or making any use of them. Pending further research, I am of the opinion that they are saved for medicinal undertakings carried out in secret by old men and women. The same may be said of the castor oil plant (Ricinus communis), which is definitely adventitious.

226 Tephrosia toxicaria is a poisonous legume, a kind of tingui
824 [Lupinus cascavella] used in fishing.
278 They are not familiar with the fishhook, and use [276: full page of figures] [277] a sort of fish trap made with bamboo or with the stem of the titara liana (Desmoncus sp.).
262 The following foodstuffs are represented in the collection.

--Guaiatú: white maize.

--Urinodzu: manioc dough, which under microscopic examination proved to be very rich in starch grains. The root, once grated, 252 is pressed [by wringing] with a straw cord, the caaru. (1) The grater
[415]

1. [Heloisa Alberto Torres notes that the cylindrical tube used to press manioc by some Amazonian tribes must have spread from the Guianas to the valley of the Amazon. Métraux considers the woven band used for the same purpose and found on the periphery of the tube territory a more primitive form. The simple straw cord of the Nambicuara would thus constitute an even more primitive variant.]

is of the type used by the Xingu Indians (Suya, etc.). It consists of a board with about two [twenty?] rows of small sticks.

[Fig. 17]

262 --The larvae of a butterfly, which they eat alive.

--Katunuzú: anthill clay, which they also eat.

. . . . . .

[824] --A mushroom, orelha de pau (Polyporus sp.), which is eaten, and beans (Phaseolus sp.) of unusual aspect were also found in one village. [278] The smoked [moqueada] head of a great anteater was [251] found in a basket by Miranda Ribeiro during the 1909 expedition.

415 Mortars (nutêzê) are hollowed out by means of fire and used to
252 pound meat and other foods.

372 They make fire with mastic resin sticks, the tips of which are wrapped in straw to protect them from the rain.

[Fig. 63]

241 415 Their plots are worked with pointed sticks. The seeds of urucu, gourd plants (Lagenaria) and cotton are kept in leaf containers.

278 824 Medicinal fruit (Solanum mammosum) is also saved, as well as roots, leaves, etc.

[Fig. 31]

386 The collection contains two samples of dyes: a paste of urucu and fat, sweetly scented, which the women use to paint their body after the bath (huduhukaidi); and a variety of red ocher. [279]

248 Cotton (1) is represented by seeds (rim de boi variety) in leaf

[171]

1. According to the studies of Fa. Schmidt and Nordenskjöld (concerning hammocks), cotton reached Brazil from the Andes and was cultivated mostly by the Tupian Indians in the midst of the Amazon jungle. It is used less extensively among the Arawakan Indians. This distribution, due in part to the needs of the plant, explains its presence among the Nambicuara, who are located at the extreme west of the plateau. (R. L.)

[283 286] containers; cotton thread (kondzú) from a spindle (gdaretatú); skeins [855] of spun cotton; cotton fabric (sareguêzê--strap used to carry children). The spindle is made of a palm splinter imbedded in a round [283] potsherd.

[Fig. 64]

415 924 Kateçú are fruits of the Lagenaria genus used as containers and storage vessels. Some hold crudely chopped tobacco and are stoppled with a corn cob, a method frequently used by the frontiersmen.

[See fig. ... (28) p. 30B.]

/214 cont./

278 Only the bark of the roots impregnated with a reddish,
224 gummy juice is used in the preparation of curare. The plants which grow in sandy places are considered to be richer in poison; they are recognized by the bright red color and moisture exuding from incisions made in the bark. Roots from clayey earth are dry and considered incapable of giving an active product.

The Ñambikwara of the Juruena consider it essential to gather the roots in the morning at dawn before the sun gets too hot, and they only use fresh bark. The Çabanè use dried, stored bark by preference.

Çabanè Curare

278 The preparation of Çabanè curare may be taken as typical. It comprises three main operations: draining of the bark in portions with fresh water; rapid boiling to rid the product of some of its impurities; slow concentration at low heat.

[H2] Immediately after their harvest the roots are washed and then scraped with a splinter of bamboo or a piece of iron to detach the bark. Small, very fine shavings are thereby obtained which are dried and kept in baskets or gourds.

• [H5] Draining of the bark. The bark is placed in a small, elongated basket (kọnọsimatá) of bamboo lamellae reinforced by large leaves (kọnọkọnọsi) and hung by two vertical supports over an earthen dish. Over the bark they pour 200 to 250 cubic centimeters of cold water; a blood-red liquid filters off slowly. The filtering takes 15 to 20 minutes; when it is almost over fresh water is again poured over the bark. This operation is repeated six to eight times until the bark is exhausted (Pl. IV, A-B).

[H2] Boiling on a brisk fire. After each operation the liquid obtained is poured into a receptacle placed directly over a strong fire; it is constantly /215/ stirred with a wooden spatula and does not take long to boil in large bubbles. When it

/215 cont./

278 threatens to overflow it is removed from the fire for a second and then put back to boil. A thick, reddish scum forms which [412] holds the largest impurities; it is removed as it appears with a straw from a palm tree (Pl. V, A). After five to ten minutes on an average the boiling diminishes; the liquid turns brown and begins to thicken. It is then taken from the fire and [415] poured with the aid of a funnel (kõli) made from a rolled leaf into a new receptacle to be concentrated (Pl. IV, C).

[415] [417] Concentration. The concentration is done in a receptacle (here, a tin can from the mission) suspended 40 or 50 centimeters above a small fire, into which successive portions of liquid are added as they are prepared. The concentration takes two to three hours. According to its degree /of concentration/ they obtain a thick blackish-brown liquid, reddish when looked through, ready to be applied to the arrows with a straw, or a black paste which becomes very hard on cooling and can be kept for a long time. Before being used this paste must be softened at low heat.

The Çabanè recommend that one not touch the curare with the fingers nor even breathe the steam from it during the boiling. This hypothetical toxicity of the steam had already been noted by former travelers; it was even asserted that these emanations were so dangerous that the Indians had the curare prepared by old women who almost always succumbed to it. One can see (Pl. V, A) that the Çabanè sorcerer is not afraid of it.

Curare does not enter healthy skin, and the Nambikwara of the Juruena press the water-soaked bark between their hands, taking the sole precaution of washing immediately afterward. The steam that I voluntarily inhaled never caused me the least sickness.

[492] The Çabanè call curare and the plant which produces it irĩwa, and the still unconcentrated liquid from soaking iriwiya. The Tagnani name the plant and the curare nalõç̃.

Rio Juruena

/215 cont./

278 Curare of the Ñambikwara of the Rio Juruena

The technique of the Ñambikwara of the right bank of the Rio Juruena is more primitive.

They use only bark which has just been gathered. The draining off of the bark is done only once and with warm water: the bark /216/ is put on the fire in a rather large amount of cold water, and the operation is ended when the temperature reaches 37° to 40° /centigrade/. It is filtered quickly by squeezing the bark with the hands to extract all the liquid from it. Then comes rapid boiling over a high fire and skimming. After several minutes of a rolling boil the fire is lowered and the liquid kept at a temperature a little below boiling until it has a pasty consistency.

[415] [237] The curare is kept in paste form in bamboo tubes or changed into a very hard mass by the addition of meliponine beeswax.

This method exposes the curare to strong heat for at least two hours. The Çabanè method reduces this time to ten minutes, the other operations being carried out at low heat. Both produce curares with about the same activity.

[192] [411] The Rio Juruena Ñambikwara call curare and the plant a'utlisú or a'ukisú; the roots ta'ñdisú; the poisoned arrow aurú kiritkatsú, and its protective bamboo sheath agirikatsú.

Utilization of Curare

278 411 The Ñambikwara are not familiar with the blowgun. They use curare to poison large arrows with long, notched points, capped with a protective bamboo sheath. The points of the Tamandé curare arrows are shorter and more slender than those of the other Ñambikwara. They are usually placed in twos, threes, and fours under a single protective sheath.

According to the Indians an arrow's activeness does not last more than three or four months. The curare in paste form is kept for a longer time (close to a year). Hard curare can be kept for years.

627 The chief admon-
[622] ishes quarrelsome individuals but appears to have no powers of coercion. The Wakitisu claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

543 The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very close. On occasion they share each other's wives. No particular respect is paid to in-laws.

RELIGIOUS BELIEFS AND PRACTICES

774 According to the Wakitisu the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*sydakudiw*), bring sickness unless offerings of food are made to them. The ghosts of dead shamans (*swiaw*), belonging to other bands bring thunderstorms which destroy gardens and make hunting difficult. In addition to the ghosts, there is *tsuptá*, the hawk of death who lives in the sky, and *wlurá*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

Tsuptá is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human bones. This tree (*kikakutsu*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tsuptá* defecating at night. A small red bird (*dintsuna*), who lives with *tsuptá*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

[p. 99(2)]

conscious function the bringing of psychological compensations incommensurable among themselves, rather than for establishing equivalences of value.

The Nambikwara have two types of burial. The eastern groups practice double interment. The bodies are first placed in a crouching position (ãriuaerekititu, a1) in a circular ditch (sinitãkurisu, a1) seven feet deep heaped up with earth and branches. For two months, they sing, dance and weep around this provisional tomb, until the body is decomposed. Then the bones are carried to the river where they are carefully washed. Then they are carried in a cloth to be permanently buried in the village. The village is then abandoned, but the site is often visited:

53. apregande ãũnikere kadukãrage ĩaudrige ende ende ende inare inaretaire ĩinoribate (b1)
to dig the grave, to close it, to wait one moon, one moon, one moon, to take out the bones, to bury them in the village.

In the central groups, on the other hand, the bodies would be buried (aoʔenĩkere, b1) in a prone position (idtarige, b1).

The funeral rites distinguish between movable goods and immovable goods. The first are carefully destroyed; they break and burn the weapons; they unravel the beads and necklaces.

The garden of the dead man, if he cultivated one, is, however, only abandoned, and can be reclaimed later:

54. dõõre dutige adede autadutige audotahãmdige audotaãmde odenehẽire odunhĩnde njaotumnie narainidãnde naradutige afredugeidtige den den den nagiaode aire dugiotige tiaugidtige (b1)
The arrows are broken, everything must be broken the beads are unstrung, the beads of the deceased, the fields of the deceased are abandoned one moon, one moon, one moon, and when all is forgotten, another takes the field.

Yet it is necessary to avoid confusion on this point. Strictly speaking, there is no land property among the Nambikwara. The chief invites his men to group together to cultivate the gardens, but sometimes such and such an individual decides to clear a field on his own account. These personal appropriations do not give rise to any incidents since the cultivatable land is usually far larger than the collective needs. However, a garden represents a value, because of the considerable amount of work spent in clearing it, especially for people who have never seen metal tools until 30 years ago. Also the rule of destruction of the goods of the deceased respects the

423 garden, with the stipulation, of [113] a psychological and moral order, that one wait to take possession until "the memory of the dead has been lost." However, this semijudicial means of acquiring land does not imply the existence of an inheritance right. The relatives are not favored, and anybody can avail oneself of the same title.

GENERAL PSYCHOLOGY AND DAILY LIFE

The Categories

128 The linguistic study of the Nambikwara should be the object of special publications, (1) and we shall thus content ourselves

> 1. C. Lévi-Strauss, Sur certaines similarités, etc., loc. cit.; Paul L. Garvin, Esquisse du Système, etc., loc. cit.

here with several summary pieces of information destined to bring into sharper focus what can be inferred concerning the broad logical categories of thought, and to assign a place to the Nambikwara group within the orbit of other American cultures.

193 The most remarkable trait of the Nambikwara language,
197 made particularly evident by the central and southern dialect (b1),
811 is an extended use of the classificatory suffixes. The systematic character of the classification of things and beings is comparable only to that found in the Ŝibŝa linguistic family. Furthermore, if one ignores several secondary differences, the division of the world into categories in Nambikwara presents a remarkable similarity with that found in the Ŝibŝa dialects. (2)

> 2. The following examples are borrowed from Walter Lehmann, Zentral-Amerika, 2 vols., Berlin, 1920, I, pp. 277-279, 404, 440, 454, 571.

In the division of things and beings into eleven principal logical categories, ten are found to be common to the Nambikwara and to the Ŝibŝa. The category "season, weather, sky" seems to be broken up, in Nambikwara, into several suffixes. Inversely, the same suffix-are classes two categories logically related but distinguished by

627 [622] The chief admonishes quarrelsome individuals but appears to have no powers of coercion. The Waklítisu claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. 421 Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. [428] [764] The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

593 The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. [837] The bond between brothers is very close. On occasion they share each other's wives. No particular respect is paid to in-laws.

RELIGIOUS BELIEFS AND PRACTICES

774 According to the Waklítisu the spirits are the source of all danger, misfortune, sickness, and death. [782] The ghosts of the dead (*aydnkadiru*), 753 bring sickness unless offerings of food are made to them. [821] The ghosts of dead shamans (*anúnu*), belonging to other bands bring thunderstorms which destroy gardens and make hunting difficult. In 776 addition to the ghosts, there is *tauptú*, the hawk of death who lives in the sky, and *ulurú*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

Tauptú is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human bones. [821] This tree (*lúlukutsu*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tauptú* defecating at night. A small red bird (*dinínuwa*), who lives with *tauptú*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

[p. 99 (B)]

that their southern neighbors make particularly nice necklaces. Also the meeting of the two groups, when it can take place in a peaceful manner, has as a consequence a series of reciprocal presents. The always impending conflict gives way to a market. This has some very remarkable characteristics in the sense that if one regards the presents only as presents, they do not bring any thanks nor proof of satisfaction. And if one considers them exchanges, they are effected without any bargaining, attempts to set the value of the article, depreciation, or manifestation of disagreement between the parties. Truthfully, they take pains not to admit that there are exchanges going on. Each goes about his usual occupations, and the objects or products go from one to the other, without the one who gives making note of the gesture by which he hands over his present, and without the one who receives paying any attention to his new wealth. In this way are exchanged husked cotton and balls of thread; blocks of wax or resin; urucu paste; shells, earrings, bracelets and necklaces; tobacco and seeds; feathers and sticks of bamboo destined for making arrow points; skeins of palm fibers, porcupine quills; whole pots or broken pottery; gourds. This mysterious circulation of merchandise goes on without haste for a half day or a whole day, after which the groups separate, and each one takes inventory of what he has received, and remembers what he has given. Thus, as regards the equity of the transactions, the Nambikwara trust entirely, the generosity of the partner. The idea that one might estimate, discuss or bargain, demand or take back is entirely foreign to them. We had promised an Indian a hunting sword as the price of transporting a message to a neighboring group. The commission was done, but upon the return of the messenger we had neglected, occupied by other cares, to give him immediately the agreed upon recompense, thinking that he himself would come to get it. He did nothing, and the next day we could not find him. He had left, very irritated his companions told us, and we did not [94] see him again. We were forced to entrust the present to another Indian. Under these conditions, it is not surprising that when the exchanges are finished, one of the groups departs discontented with its lot and, while taking inventory of its acquisitions and recalling its own presents, accumulates bitterness for weeks or months, which become greater and greater and more aggressive. It seems that wars very often have no other origin. Naturally other causes exist, such as a murder or carrying off women, depending on whether one desires to take the initiative, or whether one wishes to avenge a preceding attack; but it does not seem that a band feels

302 [431] Whenever they received good presents such as axes or beads, they would go to the brook and return with their whole face set ablaze by the blood-colored paint.

[609] This practice was carried out on outsiders by the Tagnani as a mark of special esteem. We were all granted this honor in Três Buritis...

The men do not pluck their pubic or axillar hair; sometimes they even grow a sparse mustache or an even sparser beard. The women depilate themselves completely.

487 [244] The foot paths they use are narrow, similar to cow paths in pastoral regions; in certain areas, the ground is criss-crossed with them. They also make lanes in the woods by cutting branches.

To cross a small river they make a footbridge by cutting down a tree on the bank and guiding its fall in the right direction.

501 If the river is wide, they make a bundle of muriti leaves as a float and allow the current to carry them diagonally across the stream.

[Fig. 36]

481 They are not familiar with the canoe or with navigation; they are good swimmers.

They walk fast. They cover many leagues a day, always at a brisk pace--the "long stride" [marcha em extensão] of the physiologists--with the muscles taut, the body erect.

224 The hunting of big game--tapir, capybara, the Rondon Commission's horses and donkeys--is carried out in groups. For certain species they use special arrows that will be described later.

227 In fishing they do not use fishhooks, but special arrows. (1)

The Tagnani also use a kind of fish trap.

1. According to Ehrenreich the hook is not habitually used by the Indians because of the piranha fish (Pygocentrus sp.) which are so voracious that they do not allow the fisherman to gather in his catch. Nevertheless, a hook made of thorn--the so-called pindá dos tupis [Tupian fishhook]--is found in many areas.

[Fig. 37]

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads. 622

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet. 619 438

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being presaged by its appearance the following day. 721 787

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts. 844

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony. 881 [304]

Both cross-cousin and avunculor marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony. 584 585

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance. 586 684 682

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it. 764

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups. 531

to grow manioc and sweet potatoes. He also gave them the flute (*sakiwika*), and taught them how to sing and dance. Okkkkkliu is thus the culture hero of the Nambicuara. In human form he looks like a Nambicuara Indian, wears ornaments in his ears, nose, and upper lip and paints himself with urucú. Yet today people no longer see okkkkkliu, for he has gone away. They do not have rituals connected with him, nor do the shamans solicit his aid. But the stone mountain from which the Nambicuara came is still recognized as the place of the dead. On ceremonial occasions the ghosts of the ancestors come to the encampments and villages from the mountain, returning after they have been given food.

622

Although every band has a leader or chief it is not quite certain whether these leaders get their positions through succession or by personal strength and prestige. Julio claimed that he is headman because his father was a headman, but the other members of the Wakitlóu band claim that the strongest man is always the leader by common agreement. The Nambicuara appear to value two qualities in a man—"a strong body" and "a strong mouth." The chief is like a tapir (*alóuru*) which is the strongest of the animals; thus, a chief is called *alouruldóuru*. A shaman gains power by talking or by having "a strong mouth," as the Nambicuara say. The strongest man is one who combines these qualities and is at once a strong man and shaman—he becomes an important chief.

The survival of the band, the Nambicuara believe, depends upon the *alouruldóuru*. He is the hunt leader, the head farmer, the one who organizes trade between the bands, the ceremonial head, the war leader, and the settler of disputes. Every successful chief is supposed to have four wives but otherwise has nothing to distinguish him from the rest of the tribesmen.

619

Relationships between the bands of the Eastern Nambicuara are characterized by intermarriage, trade, occasional joint ceremonies, and wife stealing and consequent armed conflicts. Intermarriage occurs when cross cousins are not available for marriage within the band. The Chiwéiu and Hágudáu obtain pots from the Western Nambicuara in exchange for war, feather ornaments, beads, and bows and arrows. These pots they in turn exchange with the Eastern Nambicuara bands for knives, axes, and tin cans.

[582]

438 619

When one band wants to meet another in order to exchange goods the approach is made in a very formal manner. The approaching band stops

[p. 96(B)]

619 #138 several hundred yards off and messengers are sent out to arrange a meeting. When agreement is reached the visiting band enters the camp, the visiting chief kneels on one knee and holding his bow and arrows above his head with his right hand he makes a speech extolling the hosts and their goods and depreciating the things which his band has brought. The host then makes a similar speech, and trading begins.

Important items are traded by the two chiefs representing their respective bands, while small items can be exchanged by individual owners. In all cases, however, the technique of trading is the same. If an individual wants an object he extolls it by saying how fine it is. If a man values an object and wants much in exchange for it, instead of saying that it is very valuable he says that it is no good, thus showing his desire to keep it. "This ax is no good, it is very old, it is very dull," he will say, referring to his ax which the other wants. This argument is carried on in an angry tone of voice until a settlement is reached. When agreement has been reached each snatches the object out of the other's hand. If a man has bartered a necklace, instead of taking it off and handing it over, the other person must take it off with a show of force. Disputes, often leading to fights, occur when one party is a little premature and snatches the object before the other has finished arguing. The term "boca forte" (strong mouth) applies particularly to trading, for a man with a strong mouth gets what he wants and convinces the other that he, too, has made a good bargain. This method of trading contrasts sharply with that practiced among the Upper Xingú tribes where each party places a pile of goods opposite the article he wants, usually without saying a word. If agreement is not reached, each one eventually withdraws his goods.

619 583 After a satisfactory exchange of goods the two bands go hunting and prepare a quantity of food and dance as long as the food lasts. During these meetings marriages are sometimes arranged, but more often, when leaving, some strong man will try to steal the wife of some other man. If a fight should occur in which one man is killed the winner will take not only his wife or wives but his children and property as well.

619 Rev. L. W. Beckman gave the following account which reveals something of the tension between

1: Lévi-Strauss--105 E-6 (1938-1949)1948 SP17 Nambikuara SP17

622 The command carries, moreover, a certain number of fixed offices. It is the chief who makes the poison for arrows; and he presides over ceremonies of initiation, of marriage or burial, concerning which we shall speak later. He organizes chants and dances, festivals both when they assume a ritual character, and when they have as a goal purely secular distraction. It is he who organizes 622 ball games. The ball game is widespread in western and northern 526 Mato Grosso, for it is found from the Paresi to the tribes of the Lower Guaporé. Among the latter people we have been able to gather evidences of its sociological significance. It is perhaps the same among the Nambikwara; but, at least during the period of nomadic life, the ball game is practiced with a purely recreational goal in mind. The teams are built up haphazardly from those present and upon the spur of the moment, and the game takes place in a spirit of complete improvisation.

WAR AND TRADE

648 The two subjects should be treated simultaneously, commercial 609 exchanges usually representing potential wars peacefully re-[91] 439 solved, and the wars, the outcome of unhappy transactions. Among the numerous bands which cross through the bush during the dry season, it is necessary to distinguish those who are related by family ties, and who often represent the population of a winter village—or of a group of villages—which has "burst forth" in the pursuit of the nomadic life. Among themselves these bands entertain relationships which are normally pacific, although not necessarily so. On the contrary, bands which are strangers to one another, composed of members not related among themselves and whose geographic location is far distant, or who are even separated by differences of language, mistrust one another at the same time that they feel themselves necessary to one another. Only when they meet can they procure desirable articles which only one of them is capable of obtaining or of making. These articles seemed to us to belong essentially to three categories: first of all women, whom only victorious expeditions are permitted to carry off. Next seeds, notably bean seeds, and finally ceramics, or [283] even fragments of pottery used to make the weights of spindles. Group [94] al whose cultural level is clearly inferior (especially in its ignorance concerning pottery) to that of its western and southern neighbors, according to the word of its chief, had carried on several campaigns during the last few years with the goal of procuring these two last articles.

37. tamaĩ'a ãtne munãtjere munãtjenãtitore njanã' (bl)
The Tamandé sing well; as for me, I cannot sing well any more!

In one case which we witnessed, the general tone was quickly raised with the excitement of the meeting, and the night had not yet ended before the speeches mixed with chants made an extraordinary uproar, whose significance escaped us completely. Menacing gestures were outlined, sometimes even some scuffles were produced while other Indians intervened as mediators. All of these hostile manifestations are stylized, and end as gestures calling to mind sexual parts of the body. On the part of the aggressor, menace, or the gesture of Nambikwara hostility, consists of seizing the penis with two hands and directing it towards the adversary while inflating the stomach and thrusting it out, and of flexing the knees (the men also make this gesture in fun toward children when they wish to get rid of them). The second stage consists of an act of aggression toward the person [291] of the adversary, with a view to tearing off the piece of buriti straw attached to the front of the waist, above the sex organs. The latter "are hidden by the straw" and "they fight to tear away the straw." This action is entirely symbolic, for the covering of the male sex organs is made of such fragile material and is reduced so small in size (and often non-existent) that it is out of the question for it to assure protection of or be any kind of covering for the organs. Another form of aggression consists of seizing the adversary's bow and arrows and laying them aside. In all of these actions the attitude of the Indians is extremely tense as if they were (and really, they are) in a state of violent and contained anger. Doubtless these brawls degenerate at times into generalized conflicts, but in our case, they calmed down at dawn. Always [93] in the same state of apparent irritation, and with gestures devoid of friendship, the adversaries looked at one another to inspect one another, rapidly [301] feeling the earrings, the cotton bracelets, the little feather ornaments, while murmuring rapid words:

38. tõhẽ' tõhẽ' kãhẽ' kãhẽ' mutinĩ'ti (bl)
Give, give, see, see, it is pretty!

This "inspection of reconciliation" marks the normal conclusion of the conflict. And actually it is this which introduces the new aspect which the relationships between the two groups are going to take—commercial exchanges. However summary the material culture of the Nambikwara may be, the products of the industry of the different groups are highly prized by their neighbors. The eastern groups need pottery and seeds; the northern and central groups consider

that their southern neighbors make particularly nice necklaces. Also the meeting of the two groups, when it can take place in a peaceful manner, has as a consequence a series of reciprocal presents. The always impending conflict gives way to a market. This has some very remarkable characteristics in the sense that if one regards the presents only as presents, they do not bring any thanks nor proof of satisfaction. And if one considers them exchanges, they are effected without any bargaining, attempts to set the value of the article, depreciation, or manifestation of disagreement between the parties. Truthfully, they take pains not to admit that there are exchanges going on. Each goes about his usual occupations, and the objects or products go from one to the other, without the one who gives making note of the gesture by which he hands over his present, and without the one who receives paying any attention to his new wealth. In this way are exchanged husked cotton and balls of thread; blocks of wax or resin; urucu paste; shells, earrings, bracelets and necklaces; tobacco and seeds; feathers and sticks of bamboo destined for making arrow points; skeins of palm fibers, porcupine quills; whole pots or broken pottery; gourds. This mysterious circulation of merchandise goes on without haste for a half day or a whole day, after which the groups separate, and each one takes inventory of what he has received, and remembers what he has given. Thus, as regards the equity of the transactions, the Nambikwara trust entirely, the generosity of the partner. The idea that one might estimate, discuss or bargain, demand or take back is entirely foreign to them. We had promised an Indian a hunting sword as the price of transporting a message to a neighboring group. The commission was done, but upon the return of the messenger we had neglected, occupied by other cares, to give him immediately the agreed upon recompense, thinking that he himself would come to get it. He did nothing, and the next day we could not find him. He had left, very irritated his companions told us, and we did not [94] see him again. We were forced to entrust the present to another Indian. Under these conditions, it is not surprising that when the exchanges are finished, one of the groups departs discontented with its lot and, while taking inventory of its acquisitions and recalling its own presents, accumulates bitterness for weeks or months, which become greater and greater and more aggressive. It seems that wars very often have no other origin. Naturally other causes exist, such as a murder or carrying off women, depending on whether one desires to take the initiative, or whether one wishes to avenge a preceding attack; but it does not seem that a band feels

63. tenũkẽ tenũkẽ utawtiri (bl). 157
To me! To me! Throw! 521

However the artisan at work also makes his wife, child, neighbor participate in the execution of the work on whose vicissitudes he comments gaily:

64. tiõ tanĩ tiõ... ẽmi... kãtaha... munẽlina... kãtiaene... nocua... talumẽ... nãhin... iahena... mãhiana. (bl)
Hold it [the cord] so that I can twist it... let it go! It fell!... There!... It is difficult!... It is done!... Does it suit you?.. It is ugly!... No, it is pretty!

The last formula is ritual, it is the one they use at the end of [88]
chants and dances; the protagonists excuse themselves: "it is ugly"; and the audience responds: "No, it is pretty!"

[123] This politeness is not always without malice, and compliments 157
sometimes hide attempts at mockery. We cited above the formula used by 521
a group to depreciate their dances in comparison to those of their companions 576
they have just met; (1) but a few hours earlier, disdaining a present of beads

1. Cf. p. 92.

which I offered and which were not much appreciated because of their color, they advised me:

65. uõtin maimãdé tumãhãde (bl)
Keep them to give to the Maimandé.

One day we were sold poison tubes (by group a2) described as so 439
dangerous that we should abstain from ever opening them under pain of im- 799
mediate death. They proved to be empty, which testifies to great 157
ingenuity if the mystery was improvised on our account. In any case, it throws a curious light on the relationships between neighboring groups.

412 415 in her burden basket, whereas the modern axe, knives, and other tools, along with his ornaments, the man carries in a similar basket, or he straps this basket on the back of a boy while he walks in front of the file carrying his bow and arrows or gun ready to shoot whatever game is met along [264] the way. Whenever they kill some animal or catch a few fish and feel hungry they stop and prepare a meal. During the dry season they are at home anywhere in their band territory, moving only when hunger spurs them on.

411 412 177 Today, of course, the Nambicuara have steel axes and knives. The heavy equipment of the Wakitisu band in 1948, consisted of three axes, two shotguns, and some half dozen hoes which were hidden near their permanent house. Each man had a butcher knife, but all men did not have bows and arrows. There did not appear to be any desire on the part of each man to possess these implements. So long as the band had a few of these objects everyone seemed to be satisfied. Chacrudo, a widower when he arrived in Utiarity, did not possess a bow and arrow, nor a gun, nor an ax. By working for the Protestant missionaries he acquired an ax and when Marciano died he inherited his bow and arrows. After a • [439] few days, however, he had given the bow and arrows to a Brazilian in exchange for a felt hat.

412 Examining the hand tools which Julio used, the following articles were found: A chisel (*kwotiru*) made by inserting a piece of steel into a wooden handle wound with twine; a small bamboo [306] knife (*alkikwirikutu*); a hardwood drill (*Mokutu*), used with sand for perforating tucum nut shells in making beads; a piece of sandstone (*dälipiru*), used as a whetstone; a number of rough leaves of the lixeiro tree (*kle'dnutu*), used as sandpaper; and a 415 comb (*ka'dlutu*). Each of Julio's three wives had a burden basket, a small square basket, and two or three gourd vessels of various sizes. A single wooden mortar and pestle did service for the whole band.

411 One of the most important implements of the Nambicuara is the bow, *kälkiu*, made from the piuva (jacaranda-copaia) or the siriva palm (*Syagrus speciosa*). By far the most common is the bow made from piuva, ranging between 6 and 7 feet in length, flat on the inside and convex on the outside. One of the bows examined measured 2 meters and 14 cm. in length, 4 cm. in width, and 1.5 cm. in

of the couple among the Nambikwara. It is the economic and psychological unit par excellence. Not only among errant bands which are made and unmade unceasingly does the couple appear as the only stable reality (at least theoretically), but it is the couple alone which assures the subsistence of the members of the group. The Nambikwara live under a double economy: the economy of hunters and gardeners on one hand, the economy of collectors and gatherers on the other. The first is assured by the man, the second by the woman. While the masculine group departs for a whole day to hunt, armed with bows and arrows, or works in the gardens during the rainy season, the women, armed with digging implements, wander with their children across the plain, and gather, pull out, pick, capture, seize [55] everything on their route that is worthy of serving as food: grain, fruits, berries, roots, tubers, eggs, small animals of all sorts. At the end of the day, the couple meets around the fire. When the manioc is ripe, and as long as it remains so, the man brings a bundle of roots which the women pound and press to make a kind of pancake (uridnonu, al), and when the hunt has been fruitful, they rapidly cook pieces of small animals by burying them under the burning cinders of the family fire. But for seven months of the year, manioc is rare. As for the hunt, it is most often a matter of chance in these sterile sands where a skinny small animal hardly ever leaves the shade, and the pasture lands at the heads of rivers are separated from one another by considerable stretches of semi-desert brush. Thus, the family must most often subsist on the collection of the women. Very often we have attended (and sometimes shared) these diabolical doll-size snacks which, for the Nambikwara, for half the year, are the only hope of not dying of hunger. When the man, silent and fatigued, returns to camp and throws his bow and arrows which he could not use to one side, from the basket of the woman is extracted an extraordinary and moving collection: some orange fruit from the buriti palm (e?eru, al, e?ende, bl, ?ola, c), two fat poisonous spiders (korai'su, al, kuende, bl), some tiny lizards' eggs and some of these animals (katerisu, al, nagade, bl, tali'me, c), a bat, some small nuts from the bacaiuva palm (arookesu, al, lokoninde, bl), or uaguassu (aradikisu, al), a handful of grasshoppers (takedasu, al, tagere, bl, tarki, c). The pulpy fruits are crushed with the hands in a calabash filled with water, the nuts cracked with the blows of a stone, the animals and larvae buried pell-mell in the coals; and this repast is gaily devoured, a meal which would not be sufficient to satisfy the hunger of a white person, but which feeds a family here.

593 182 462 The conversation becomes animated and laughter spreads. In the dark prairie the camp fires burn. Around the fire, the only protection against the cold which descends, behind the frail windbreak of palms [342] and branches hastily planted in the ground on the side where wind or [415] rain is expected; near the baskets filled with poor objects which constitute their whole earthly treasure; lying on the ground which extends around, haunted only by other bands equally hostile and fearful, the couples, embracing tightly, are truly seen as the support of one another, the comfort, the only help against the daily difficulties and the dreamy melancholy invades the Nambikwara soul from time to time. The visitor who camps in the brush with the Indians for the first time feels tenderness as well as anguish and pity before the spectacle of this humanity so completely unprotected; crushed, apparently against the soil of a hostile land by some implacable cataclysm; naked, shivering around the hesitant fires. He circulates tip-toe among the underbrush, in the dark, avoiding crushing in his walk a hand, an arm, a trunk, whose warm reflections are seen by the light of the fires. But this misery is animated by whispering and laughter. [56] The couples clasp one another as in the nostalgia of a lost union. Their caresses, at the same time tender and candid, are not interrupted by the passage of the stranger. One senses in all [157] of them an immense gentleness, a profound carelessness, a naive and charming animal satisfaction, and, emanating from all that, something like the most moving and credible expression of human tenderness.

593 831 462 542 [517] Thus it is not surprising that the attitude of the two sexes as concerns one another is characterized by intense interest. This interest is translated in certain cases by the vocabulary. In fact the Nambikwara have only one word to express "pretty" and "young," and a single word signify "ugly" and "old" (munjene, jeʔene, bi). Their esthetic judgments are thus based essentially on human considerations, and above all, sexual ones. But the interest which is manifested between the sexes is of a complex nature. Men judge women in a mass, as being a little different from themselves. Depending on the situation, they consider them with desire, admiration, or tenderness. In itself the confusion of terms pointed out above constitutes permanent homage. But it must not be forgotten that the form of economic adaptation realized by sexual division of labor a capital role attributes to the women, since family life rests to a very large degree (probably the greatest) on the collecting of the women, but it represents an [153] inferior type of activity. The ideal life is conceived on the model of agricultural production or hunting. To have plenty of manioc, and

593 831 462 [83] 562 fat pieces of meat is a constantly relished dream, even though rarely realized. On the other hand, the provisions haphazardly collected are considered—and really are—the daily misery. In Nambikwara folklore, the expression "to eat grasshoppers" (tagare yirige, b1), a typically feminine and infantile harvest, is nearly equivalent to the French "to eat the mad cow" (to rough it). At the same time the woman is considered a tender and good being, but of the second [198] order. The language which she uses habitually separates her from the men and unites her with the children (in the same way that she collaborates with the children in expeditions of collecting and gleaning). We shall see later that this assimilation also continues into the metaphysical thinking and that, on this latter plan, discrimination between the sexes attains proportions whose psychological attitudes are only a derisive indication. It is considered well-bred for men to speak of women with a pitying good will, and, in conversations between the two sexes, to address them with a slightly mocking indulgence. Certain sayings are heard often among men speaking among themselves:

[538] 5. yirtnoʃunatukhne joʔotnuʃutnãdnjani denesunatukhne. (b1)
The children do not know, I know, the women do not know.

and they bring up the group of women (dosu, a1), their jokes, their conversations, with a tone of tenderness and mockery. But, of course, that is only [57] a social attitude. When the man finds himself alone with his wife around the camp fire, he listens to her complaints, considers her demands attentively, asks her help in a hundred undertakings. The male line of talk disappears, and gives way to the collaboration of two partners conscious of the essential value which they have for one another.

198 562 This ambiguity of male attitude as regards women has its exact correspondence in the equally ambivalent behavior of the female group. The women think of themselves collectively, and manifest it in several ways. In the first place they do not talk like the men. Even though a sexual language does not exist in the true sense of the word, in conversation a thousand inflections, shades of pronunciation are found which are typically feminine. Women articulate badly and affect a sort of jabbering which is reminiscent of infants' pronunciation. They whisper instead of talking out loud, and emit sounds with an affected mannerism and preciosity which are at times seductive when they are not exasperating. Thus, in dialect a1, they give words an ending —ʃu instead of the usual—su or —tu. They also pronounce—kititu, the verbal suffix which is for men, —kedjutu or —kedjuzu.

198 It is certain that they are perfectly aware of this peculiarity.
562 When one does not understand them and asks them to repeat, they exaggerate maliciously, and more each time, the style that is particular to them, and when one desists, discouraged, they laugh and exchange jokes. They have succeeded. This is especially true of young women who do not yet have children, and of young concubines. The mothers and older women stress these differences less, although one also finds them among this group upon occasion. Besides, the young women like the society of children and adolescents, play and joke constantly with them; and it is the women who take care of the animals in that very human way peculiar to certain South American Indians. All this contributes to creating a special atmosphere around the women, in the interior of the group, at the same time child-like, happy, affected and provocative, in which the men participate when they return from the hunt or the gardens.

462 But a completely different attitude is manifested among the women when they are to undertake some one of the forms of activity which are especially intrusted to them. They accomplish their tasks as artisans with ability and patience, in the solitary camp, arranged in a circle and with their backs to one another, and, during trips they [188] valiantly carry the heavy basket which contains the provisions and riches of the whole family and the quiver of arrows, while the husband walks ahead with the bow and one or two arrows, the wooden spear or the digging implement, looking for the flight of an animal [48] or a fruit tree. One sees these women then, the forehead bound with [48] the tump line, the back completely covered by the wide basket in the form of an inverted bell, walking for kilometers with their characteristic step; [58] the thighs very tense, the knees together, the ankles turned out, the feet turned in; leaning on the outer edge of the foot and moving the hips, courageous, energetic and gay. We give on the opposite page[1] a chart of the division of tasks between the sexes, but this division should be interpreted in a less strict manner than usual for phenomena of this type. Among the Nambikwara collaboration between husband and wife is carried so far that many tasks are done jointly. More exactly, if the man rarely intervenes in feminine tasks, the woman on the other hand (and above all the supplementary wives in case of polygamy) unceasingly aid their husband. We have indicated by crosses between parentheses the cases where a task attributed to one sex is occasionally practiced by the [462] other. Thus, when they are alone or among themselves, the men do the carrying, but they do not carry from the forehead (senasikitiu, al).

[1] [See p. 11. Duplicate]

462
[62] like the women, but from the shoulder (adiuisi'kititu, al), and frequently lightening the load by dragging the strap in the left hand, which they explain by saying that they need to watch out for possible game. And they naturally do not neglect collecting and gleaning whenever the occasion is presented or necessity is felt. In like manner, the women normally aid their husbands (especially the polygamous wives) in their work in the gardens. Both sexes cut down wood, the men for constructing huts or shelters and for making bows, arrows, spears and clubs, etc., and the women, more often, for the fire wood. Above all, and when she is not occupied by her own work, the woman aids her husband in all the tasks that are his. She holds his implements, gives them to him when he asks for them, supports the end of the arrow or the wood of the bow while he repairs or polishes them, or begins to twist the cord while he finishes the wooden part. She does the retouching and finishes the work. This frequent and always harmonious collaboration gives the impression that the sexual division of labor is much less strict among the Nambikwara than it is commonly, and sometimes one might even think it non-existent. This is not so; but the rule is constantly made flexible or masked by the unity of the couple.

601 As we have shown in studying the kinship system all the classifi-
602 catory contemporaries of an individual belonging to a different sex are divided by him into husbands and wives, and brothers and sisters. We have found no term which designates the actual spouse, and allows one to distinguish him in conversation from the classifying spouse. A man calls his wife or wives, and his cross-cousins (fem.) indiscriminately asiesu, as the woman designates her husband and her cross-cousins (masc.) by the same term owensaesu. But, of course, behavior is very different in the two cases. It has just been seen to what extent relationships are close and active between true husband and wife. As regards his potential wives, a man does not adopt any particular attitude, and the relationships do not seem to be either [59] [Table: Sexual Division of Labor] more or less intimate than those which he carries on with his sisters (the same remark is true as regards the relationship of a woman with her potential husbands and her brothers). In these two cases, the relationships are characterized by [60] great reserve, the individuals involved do not pay much attention to one another and rarely address one another except for definite reasons. But it is a question here of a mass attitude, conditioned by usage, rather than of an over-all picture of conscious and stylized reactions. The Indians do not seem to perceive

601 The Indians do not seem to perceive
602 the specific nature of certain inter-individual relationships except in
[123] the case of relationships of stepmother and stepfather, as will be seen farther on. Nevertheless, the very great liberty which reigns between a man and his wife on one hand, and his brothers-in-law on the other, contrasts greatly with the more serious and dull character of his dealings with his sisters or his (theoretical) wives. This reserve goes to the point of forbidding the verbal expression of the relationship of potential spouses among the children to a certain degree. In the
[124] course of our interrogations, we have always found it difficult to obtain an answer from the interested parties themselves or from their close relatives when the relationship was that of husband and wife (1).

1. The Indian questioned answers that he "does not know" or changes the subject of conversation.

However, there was no case where the exact answer was not given after several evasive words, or an affectation of ignorance, or an attitude of ill will. But however slight the prohibition (the exact information seems to be considered rather as an impropritey or an
[355] indelicacy), it is no less odd because of it, since children classed as potential spouses behave often, and very openly, as such, without anyone objecting to it.

595 Several times we have alluded to polygamy, concrete examples
462 of which were analyzed on the occasion of the study of the kinship systems. Among the Nambikwara, polygamy represents a general tendency limited by the quantity of available women, and a prerogative existing among the chiefs of the groups, the shamans, or outstanding personalities. From this point of view, it springs from the study of command, and we shall return to this when this problem is tackled. Whenever it exists, polygamy is not a substitute for monogamous marriage, it is added to it without suppressing it. An individual begins by marrying one single woman, and upon the occasion of his social advancement, or of happy occasions, it is suitable for him to add some companions. But a very clear distinction, even though it is not sanctioned by the vocabulary of kinship (2), is

595
601 2. To characterize the functions of the first wife, an informant (A6) once used the term asiẽtu atouerelisu (a1); to designate the supplementary wives, another informant (B1) mentioned a form nukẽnãtere, which could be a feminine of nukẽnãtore (b1), "companion," a term which the chief uses to designate the men of his group. But the

595
601

sense of this term remains doubtful. And it has never been possible, in the course of the questions on kinship, to obtain from polygamous husbands discriminating terms for each of their wives.

595 established between the first wife and the new arrivals. The first
462 wife takes care of her children and devotes herself to the cares of
[252 the household, shredding the manioc and cooking the cumaru nuts.
262] She is occupied with feminine craft tasks. In short, she carries on her activities within the [61] limits of the sexual division of labor. The other wives aid her occasionally, but their main duty seems to be to assist their husband in his masculine tasks. They are comrades and collaborators who, in the general plan of the division of labor, could be more justifiably classed with the men. Their aid seems like a method on the part of the chief of the group to fulfill his heavy duties more easily, and like a psychological compensation for his responsibilities. When he leaves on a hunting or reconnoitering expedition, one of his polygamous wives accompanies him to hold his arrows and to carry in her basket the eventual prize. When he works around the camp or in the village, it is with their aid and com-
[515] pany. Although men and women do not bathe at the same time, one sometimes sees the husband and his polygamous wives take a bath together, the pretext for great struggles in the water, and innumerable
[832 jokes. In the evening he plays with them, either amorously, rolling
524] in the sand embracing two, three or four, or in a childlike way. For example A1, a3 and a4, stretched out on their backs, by way of making a star with three points on the ground, raise their feet in the air and knock them against one another, bottom of foot against bottom of foot, in a regular rythm (this game is described by the term eridnakititu, al).

595 The polygamous union is thus presented as a super-imposition
182 of a plural form of amorous companionship on the monogamous marriage, and at the same time, we insist, as an attribute of command with a functional value from the psychological point of view as well as from the economic. The women usually live on very good terms, and although the first wife has a role that might seem a little unappreciated, working while she hears at her side the bursts of laughter of her husband and of his little mistresses, and sometimes even witnesses more tender frolicking, she does not show either bitterness or jealousy. In fact, this distribution of roles is not either unchangeable or rigorous, and, upon occasion, although rarely, the

846 784 1. She wears no decoration or ornament;

[107] 2. She does not touch food, neither to harvest it, to gather it, to prepare it nor to cook it;

3. She speaks to no one and no one says a word to her;

4. She avoids groups and when curiosity draws her toward our circle, she attends the distribution and exchange of gifts from a distance and in silence. If someone gives her or her husband a present (for example some beads), it is immediately given to the baby;

5. Every day she receives her food from her mother (a18), who gives it to her without speaking, and occupies herself with certain cares of the baby such as delousing it;

6. She does not bathe in the river, but washes herself with the water which she herself goes to draw in a gourd;

7. She goes away with her husband, sometimes for whole days, and, upon departure, follows him at a distance without saying a word; on these occasions, she takes the baby along;

A21 behaves similarly:

1. He does not go with the masculine group when they go hunting or gardening;

2. He rarely goes away, and then with his wife. The rest of the time he spends stretched out without taking part in any creative activity; *they say he is ill* (*inkaltu*);

3. In the degree to which he and his wife perform the most [162] indispensable activities, there is no division of labor between them. Either one buries the baby's excrement, or places in the coals the manioc received by a22 and a18 which constitutes their sole nourishment. Both are extremely thin, and appear very weak; their hair has not been cut or washed for a long time.

Toward June 20, 1938, this behavior was modified. For three consecutive days A21 and a22 disappeared for the whole day, doubtless to hunt, for, after several fruitless trips, they return (June 23 at 15 o'clock) with the following small game:

a. An irara (Mustela sp.);

b. Three bats;

c. Two lizards and their eggs.

846 252 The irara and the bats have already been put over the flame to burn off the hair. a22 begins immediately—and for the first time—to clean and crush a small quantity of manioc and she quickly puts a cake under the coals. At the same time she puts the broken lizard eggs there, and [108] takes them out barely cooked; she divides

361 clude at least one stretch of river and the "galeria"
621 forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. Within this hunting territory they have camping places rather than villages. A semipermanent camp site where fields are cultivated for 2 or 3 years is known as *sinaiáre*. Any place where the band or a family may stop overnight is known as *sáiare*. At present the
342 Wakítiau band has one house (*síre*) at the place
621 where it is farming. The entire band occupies the house, each family having its own fire around
[513] which it sleeps at night. The unmarried men gather around another fire. Julio informed me that their house is rectangular with stake walls and a gable roof covered with sapé thatch. Some years ago when the band was larger he said they occupied a different place on which they built three houses. These houses were built by placing a series of saplings into the ground to form an oval. The tops were then fastened to a ridge pole, the framework being covered with sapé or palm fronds. A smaller beehive-shaped house is made in the same way. Houses of this type are from
[343 6 to 10 feet high. Near the living house they
346] build a small fire hut (*sinaiáhárare*) and, when the occasion demands, a shaman's hut (*sikiárare*).

342 If the weather is cold while they are out hunting the band or the family may build a temporary brush hut for the night. Sometimes only a windbreak (*nanáwé*) is considered sufficient. On warm nights during the dry season the group camps under a tree. In favorite hunting places the same camp site will be used repeatedly.
[241] When the soil around the permanent camp site or village becomes exhausted, fields are cleared some distance away and small huts are put up for the workers. As the distance increases the old camp site is eventually abandoned and a new campsite is established.

352 As the Nambicuara do not use hammocks, beds, or seats, there is not much in the way of
415 furniture in their shelters. Utensils are restricted to a few gourd vessels, tin cans, burden baskets and small flat baskets, fire fans, bows and arrows,
[482 and tools used by men. When they move, these
462] articles are placed in burden baskets which are carried by the women. The Wakítiau do not

Children are treated with great affection and refused nothing. They are rarely punished. Many an Indian, already elderly would walk for leagues [256] with a child on his back to come to us and give the little one some of the presents we were distributing.

They have no clearly defined chiefs. Some men the muleteers call chiefs are merely individuals of some influence frequently heeded by the others.

One day, in Campos Novos, we were visited by the Cocozu and Anunze. Several young men of both groups spent the night there: Nuleke, Kriiricoinerã (Manduca), Paixão, Preguiça [Port. "sloth], Damasceno, and the famous Cavagnac, supposed chief of the Urutau village, a scoundrel who used to ambush the muleteers on the Line and take their packs.

On the following day many Uaintaçu came; they were bold, rough, and quite unpleasant people.

The others, when they saw the Uaintaçu approaching, gave signs of agitation. Finally the Uaintaçu arrived, very much excited by the presence of our guests. An endless discussion ensued among the three groups. They all talked and gesticulated in angry fashion, with gleaming eyes, ready to attack each other. Fearing a conflict which would be disastrous on every count, we intervened by distributing cigarettes, matches, axes, etc., in order to distract them. They calmed down. But some of the Cocozu and Uaintaçu boys continued to argue and were gradually surrounded by the others who listened attentively. Two on one side would speak; two from the other side would reply. The two Indians who talked, Damasceno and Cavagnac, were more intelligent, clever and bold. There was nothing to indicate that they were true chiefs, recognized as such on every occasion. They were temporary chiefs.

Among the Tagnani and Tawite, on the other hand, there are clearly defined secular chiefs. One of them stood out because he wore no ornaments whatever [257]. He actually commanded and was obeyed by all. He had three wives.

The status of the Nambicuara woman is not so degraded as that of other Brazilian Indian women. She works hard, it is true. She gathers fruit, grates manioc, handles the mortar and pestle, erects the hunting shelters, spins cotton, carries the family belongings, cares for the children, takes part in cultivating the plot; but usually she is

198 It is certain that they are perfectly aware of this peculiarity.
562 When one does not understand them and asks them to repeat, they exaggerate maliciously, and more each time, the style that is particular to them, and when one desists, discouraged, they laugh and exchange jokes. They have succeeded. This is especially true of young women who do not yet have children, and of young concubines. The mothers and older women stress these differences less, although one also finds them among this group upon occasion. Besides, the young women like the society of children and adolescents, play and joke constantly with them; and it is the women who take care of the animals in that very human way peculiar to certain South American Indians. All this contributes to creating a special atmosphere around the women, in the interior of the group, at the same time child-like, happy, affected and provocative, in which the men participate when they return from the hunt or the gardens.

462 But a completely different attitude is manifested among the women when they are to undertake some one of the forms of activity which are especially intrusted to them. They accomplish their tasks as artisans with ability and patience, in the solitary camp, arranged in a circle and with their backs to one another, and, during trips they [465] valiantly carry the heavy basket which contains the provisions and riches of the whole family and the quiver of arrows, while the husband walks ahead with the bow and one or two arrows, the wooden spear or the digging implement, looking for the flight of an animal [462] or a fruit tree. One sees these women then, the forehead bound with [463] the tump line, the back completely covered by the wide basket in the form of an inverted bell, walking for kilometers with their characteristic step: [58] the thighs very tense, the knees together, the ankles turned out, the feet turned in; leaning on the outer edge of the foot and moving the hips, courageous, energetic and gay. We give on the opposite page a chart of the division of tasks between the sexes, but this division should be interpreted in a less strict manner than usual for phenomena of this type. Among the Nambikwara collaboration between husband and wife is carried so far that many tasks are done jointly. More exactly, if the man rarely intervenes in feminine tasks, the woman on the other hand (and above all the supplementary wives in case of polygamy) unceasingly aid their husband. We have indicated by crosses between parentheses the cases where a task attributed to one sex is occasionally practiced by the [465] other. Thus, when they are alone or among themselves, the men do the carrying, but they do not carry from the forehead (senasïkititu, a).

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life. 301

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard. 302 [386]

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton. 481 501 854

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string. 283

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Aruwak*" type (pl. 37, *center, right*). 286

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour. 285

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark. 323 [314]

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood. 412 [372] [373]

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the 411

Whenever they received good presents such as axes or beads, they would go to the brook and return with their whole face set ablaze by the blood-colored paint.

This practice was carried out on outsiders by the Tagnani as a mark of special esteem. We were all granted this honor in Três Buritis. . .

The men do not pluck their pubic or axillar hair; sometimes they even grow a sparse mustache or an even sparser beard. The women depilate themselves completely.

[244] The foot paths they use are narrow, similar to cow paths in pastoral regions; in certain areas, the ground is criss-crossed with them. They also make lanes in the woods by cutting branches.

To cross a small river they make a footbridge by cutting down a tree on the bank and guiding its fall in the right direction.

If the river is wide, they make a bundle of muriti leaves as a float and allow the current to carry them diagonally across the stream.

[Fig. 36]

They are not familiar with the canoe or with navigation; they are good swimmers.

They walk fast. They cover many leagues a day, always at a brisk pace--the "long stride" [marcha em extensão] of the physiologists--with the muscles taut, the body erect.

The hunting of big game--tapir, capybara, the Rondon Commission's horses and donkeys--is carried out in groups. For certain species they use special arrows that will be described later.

In fishing they do not use fishhooks, but special arrows. (1)

The Tagnani also use a kind of fish-trap.

1. According to Ehrenreich the hook is not habitually used by the Indians because of the piranha fish (Pygocentrus sp.) which are so voracious that they do not allow the fisherman to gather in his catch. Nevertheless, a hook made of thorn--the so-called pindá dos tupis [Tupian fishhook]--is found in many areas.

[Fig. 37]

513 [514] on the ground in the position known by the name "aztec"--on their knees, the legs and feet flat on their inner side and the buttocks resting on the heels. Or else they cut, polish and file beads from nutshells or sea shells, earrings or other ornaments. And if the work bores them, they pick the lice from one another, stroll around or sleep.

512 521 During the warmest hours the camp is silent. The inhabitants, silent or asleep, enjoy the uncertain shade of the shelters. The rest of the time, the occupations are carried on with animated conversations. Nearly always gay and laughing, the Indians exchange jokes, and sometimes, with unmistakable gestures, obscene or scatological accounts which are greeted with great shouts of laughter. The work is often interrupted by mutual visits or questions; when two dogs or birds copulate, everybody stops and contemplates the operation with fascinated interest; then work is taken up again, after an exchange of commentaries about this important happening.

512 The children lounge around during a great part of the day, the girls surrendering themselves at times to the same jobs as their elders, the boys idle or fishing along a stream of water. The men remaining in camp dedicate themselves to basketwork, making arrows and musical instruments, and sometimes to performing some small domestic service. Complete accord usually reigns within the household. Toward three or four o'clock, the other men return from the hunt, the camp becomes animated, the conversation becomes livelier, groups form, different from family agglomerations. They eat yucca cakes [262] and everything found during the day: fish, roots, wild honey, bats, 524 little animals captured, and small sweet nuts from the palm bacaiuva (Acrocomia sp.). Sometimes a child begins to cry, quickly [558] consoled by an elder. When night falls some women, chosen daily, go to collect or cut down in the neighboring woods the store of wood 512 for the [17] night. They can be seen returning in the twilight, 513 staggering under the load which pulls the tumpline used for carrying 482 it. To unload, they crouch and lean backwards a little, letting their bundle of bamboo rest on the ground in order to disengage the tumpline from their forehead.

512 In a corner of the camp the branches are amassed and each one supplies himself in proportion to his needs. The family groups form around their respective fires which begin to glow. The evening is passed in conversation, or else in singing and dancing. Sometimes these distractions are prolonged far into the night, but in general, after some amusements of caressing and friendly fighting, the couples draw closer together, the mothers clutch their sleeping infants to them, everything becomes silent, and the cold night is

It is certain that they are perfectly aware of this peculiarity. When one does not understand them and asks them to repeat, they exaggerate maliciously, and more each time, the style that is particular to them, and when one desists, discouraged, they laugh and exchange jokes. They have succeeded. This is especially true of young women who do not yet have children, and of young concubines. The mothers and older women stress these differences less, although one also finds them among this group upon occasion. Besides, the young women like the society of children and adolescents, play and joke constantly with them; and it is the women who take care of the animals in that very human way peculiar to certain South American Indians. All this contributes to creating a special atmosphere around the women, in the interior of the group, at the same time child-like, happy, affected and provocative, in which the men participate when they return from the hunt or the gardens.

But a completely different attitude is manifested among the women when they are to undertake some one of the forms of activity which are especially intrusted to them. They accomplish their tasks as artisans with ability and patience, in the solitary camp, arranged in a circle and with their backs to one another, and, during trips they valiantly carry the heavy basket which contains the provisions and riches of the whole family and the quiver of arrows, while the husband walks ahead with the bow and one or two arrows, the wooden spear or the digging implement, looking for the flight of an animal or a fruit tree. One sees these women then, the forehead bound with the tump line, the back completely covered by the wide basket in the form of an inverted bell, walking for kilometers with their characteristic step: [58] the thighs very tense, the knees together, the ankles turned out, the feet turned in; leaning on the outer edge of the foot and moving the hips, courageous, energetic and gay. We give on the opposite page a chart of the division of tasks between the sexes, but this division should be interpreted in a less strict manner than usual for phenomena of this type. Among the Nambikwara collaboration between husband and wife is carried so far that many tasks are done jointly. More exactly, if the man rarely intervenes in feminine tasks, the woman on the other hand (and above all the supplementary wives in case of polygamy) unceasingly aid their husband. We have indicated by crosses between parentheses the cases where a task attributed to one sex is occasionally practiced by the other. Thus, when they are alone or among themselves, the men do the carrying, but they do not carry from the forehead (senastkitiu, al).

462
463

like the women, but from the shoulder (adiyisi'kititu, al), and frequently lightening the load by dragging the strap in the left hand, which they explain by saying that they need to watch out for possible game. And they naturally do not neglect collecting and gleaning whenever the occasion is presented or necessity is felt. In like manner, the women normally aid their husbands (especially the polygamous wives) in their work in the gardens. Both sexes cut down wood, the men for constructing huts or shelters and for making bows, arrows, spears and clubs, etc., and the women, more often, for the fire wood. Above all, and when she is not occupied by her own work, the woman aids her husband in all the tasks that are his. She holds his implements, gives them to him when he asks for them, supports the end of the arrow or the wood of the bow while he repairs or polishes them, or begins to twist the cord while he finishes the wooden part. She does the retouching and finishes the work. This frequent and always harmonious collaboration gives the impression that the sexual division of labor is much less strict among the Nambikwara than it is commonly, and sometimes one might even think it non-existent. This is not so; but the rule is constantly made flexible or masked by the unity of the couple.

601 As we have shown in studying the kinship system all the classifi-
602 catory contemporaries of an individual belonging to a different sex are divided by him into husbands and wives, and brothers and sisters. We have found no term which designates the actual spouse, and allows one to distinguish him in conversation from the classifying spouse. A man calls his wife or wives, and his cross-cousins (fem.) indiscriminately asjeru, as the woman designates her husband and her cross-cousins (masc.) by the same term oweasesu. But, of course, behavior is very different in the two cases. It has just been seen to what extent relationships are close and active between true husband and wife. As regards his potential wives, a man does not adopt any particular attitude, and the relationships do not seem to be either [59] [Table: Sexual Division of Labor] more or less intimate than those which he carries on with his sisters (the same remark is true as regards the relationship of a woman with her potential husbands and her brothers). In these two cases, the relationships are characterized by [60] great reserve, the individuals involved do not pay much attention to one another and rarely address one another except for definite reasons. But it is a question here of a mass attitude, conditioned by usage, rather than of an over-all picture of conscious and stylized reactions. The Indians do not seem to perceive

[Text continues on p. 61]

piece of small animal. a5 asks for part of it and a4 answers: "Let your father give you his." These relationships bring about a rather curious consequence: the young girls become independent more rapidly than the boys. They follow the young wives, take part in their activities, while the boys, left to themselves, timidly try to adapt themselves to the group but without great success, and usually remain, at least in earliest childhood, beside their mothers.

[70] Considering now the relationships of children among themselves, the most striking characteristic is the absence of play. In certain groups (central and south), the children manufacture, although rarely, small objects of rolled or braided straw, but generally they know no other distraction than fights or contests which they do together, and lead an existence modeled on that of the adults. In fact, they carry on the normal day of the women: in the morning, preparing the manioc, then the cumaru nuts, bathing when it begins to get warm; when the sun is very high, retiring to the shade, and before night, gathering wood for the fire. Likewise, the girls learn to weave, they walk around, laugh, sleep. The little boys do not begin to play with little bows and imitate the male pursuits until much later (from 8 to 10 years on). But all become rapidly conscious of the fundamental and sometimes tragic problem of Nambikwara life, that of nourishment, and of the active role that is expected of them. They take part in the harvesting and collecting expeditions with great excitement. In time of need, it is not rare to see them seek their own food outside the camp, working to unearth roots, or walking in the grass on tiptoe, a large stripped branch in hand, to catch grasshoppers. The little girls know what an important role the women have in the economic life of the tribe, and are impatient to make themselves worthy of it. Thus, we find a young girl (b9) who tenderly carries a puppy in the rump line that her mother uses for her little sister, and we make the remark:

16. najuitte ałkyage
She caresses the little puppy?

Her mother answers me:

uałkyatmore uainuetuikade?ena tłgnaiene
The little girl caresses the puppy (because she wishes) to raise it.

to which the little girl adds gravely:

857 b5, who insists that the treatment that one gives the small ani-
609 mal to divest it of its hair be applied to the ethnologist:

21. nĩ inyenĩghee nũugeguedne (b1)
Put his beard in the fire! Roast his beard!

857 In general, they are to be good companions, enthusiastic, and
157 untiringly avid for games that are shown them. In exchange, they are very obliging informants once they have become friends. Al-
[55] most all the information which we were able to gather concerning proper names comes from them.[1]

231 This chapter cannot be ended without presenting some observations relating to domestic animals. Not only do the children actually live in very intimate relationships with the animals, but the latter are treated in the family like real children at least outwardly. We mean that they share the group's food, benefit from the same manifestations of tenderness or interest—delousing, games, conversation, caresses—as the human beings. In everything, their treatment is [73] curiously the same. The Nambikwara have numerous domestic animals, first of all dogs, and cocks and hens, who are all descendants of those introduced in their region by the Rondon Commission; monkeys, parakeets, birds of various kinds, and finally, the caetetu, the coati (Nasua sp.), the jaguatirica. Only the dog seems to have acquired an
[229] occasionally utilitarian role in the service of women, for hunting with the digging stick (cf. quotation No. 16). The men never use them for hunting with bow and arrow. The other ani-
231 mals are raised for the purpose of pleasure. They are not eaten,
262 the people do not consume the eggs of the hens who lay them in the bush. But they do not hesitate to devour a young bird if it dies after a vain attempt at acclimatization.

The terms used for behavior regarding animals are the same as those used for humans. They say dehẽna ũ'tte ũ'kwage, "the woman caresses the baby," or ũ'ngette ũ'kwage, "the woman caresses the puppy."

231 While traveling, except for the animals capable of walking,
● 482 the whole menagerie is packed with the other baggage. The monkeys, attached to the women's hair, adorn them with an amusing living helmet, elongated by the long tail curled around the neck of the bearer. The parakeets and hens perch on top of the baskets, other animals are held in the arms. None of them receive abundant nourishment but, even in days of need, they
231 521 have their share, however little it may be. As compensation, they are an endless subject of distraction for the group, the

SP17 Nambicuara SP17

[621] 622 tnations, and the ascent or decline of individuals and groups follow each other in a rather surprising manner.

How will the chief be able to overcome these difficulties? The first instrumental force of his power lies in his generosity. Generosity —an all important feature of chieftainship among most primitive peoples, especially in America—plays an outstanding part even on those crude cultural levels where worldly goods are limited to the most primitive weapons and tools, coarse ornaments made of feathers, shells and bones, and raw materials, such as lumps of resin and wax, hanks of fiber and splinters of bamboo for arrow-making. There cannot be great economic distinctions between families each of which can pack [462] all of its belongings in the baskets carried along by the women during [558] the long travels of the dry season. But, although the chief does not seem to fare better, in this respect, than the others, he must always have at hand surpluses of food, tools, weapons, ornaments which, while being small indeed, acquire great value because of the scarcity which is the prevalent condition. When an individual, a family or the band itself needs or covets something, the chief is called upon to secure the desired article. Generosity is the quality, much speculated on, which is expected of a new chief. Generosity is the string constantly struck which makes the general consent to one's leadership sound clear or out of tune. There is little doubt that, in this respect, the chief's ability to give is exploited to the utmost. Band chiefs used to be my best informants, and, well aware of their difficult position, I liked to reward them liberally; but I seldom saw one of my many gifts remain in their hands for more than a few days. Each time I took leave of a band, after a few weeks or a few months, its members had time to become the happy boarders of axes, knives, beads, and so on. As a rule, however, the chief was exactly as poor as at my first arrival. Everything he had received from me (and this was considerably more than the average) had already been squeezed out of him. This collective greediness not seldom drives the chief to an almost desperate position; then the refusal to give plays about the same part, in this primitive democracy, as the threat to resign followed by a vote of confidence in a modern parliament. When a chief reaches the point where he must say: "To give away is over! To be generous is over! Let another be generous in my place!", he must, indeed, be sure of his power and prestige, for his rule is undergoing its severest crisis.

Ingenuity is but the intellectual form of generosity. A great deal

361 clude at least one stretch of river and the "galeria"
621 forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. Within this hunting territory they have camping places rather than villages. A semipermanent camp site where fields are cultivated for 2 or 3 years is known as *sinoikre*. Any place where the band or a family may stop overnight is known as *sikwe*. At present the
342 Wakitiu band has one house (*sive*) at the place
621 where it is farming. The entire band occupies the house, each family having its own fire around
[513] which it sleeps at night. The unmarried men gather around another fire. Julio informed me that their house is rectangular with stake walls and a gable roof covered with sapé thatch. Some years ago when the band was larger he said they occupied a different place on which they built three houses. These houses were built by placing a series of saplings into the ground to form an oval. The tops were then fastened to a ridge pole, the framework being covered with sapé or palm fronds. A smaller beehive-shaped house is made
[343 in the same way. Houses of this type are from
346] 6 to 10 feet high. Near the living house they build a small flute hut (*sinaddéhikwe*) and, when the occasion demands, a shaman's hut (*sikkiwtre*).

342 If the weather is cold while they are out hunting the band or the family may build a temporary brush hut for the night. Sometimes only a windbreak (*sinddehi*) is considered sufficient. On warm nights during the dry season the group camps under a tree. In favorite hunting places the same camp site will be used repeatedly.
[241] When the soil around the permanent camp site or village becomes exhausted, fields are cleared some distance away and small huts are put up for the workers. As the distance increases the old camp site is eventually abandoned and a new camp site is established.

352 As the Nambicuara do not use hammocks, beds, or seats, there is not much in the way of
415 furniture in their shelters. Utensils are restricted to a few gourd vessels, tin cans, burden baskets and small flat baskets, fire fans, bows and arrows,
[482 and tools used by men. When they move, these
463] articles are placed in burden baskets which are carried by the women. The Wakitiu do not

[P. 38 (10)]

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

The Wakitis do not
323 make pottery, but they sometimes acquire pots from the Parecsi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakitis band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
584 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrow, the wife following
[482 and carrying a burden basket on her back and a
458 baby strapped on her hip, an older child following
222 her. As they move slowly along they collect fruits, nuts, insects, snakes, ants, lizards, rats,
226 wild honey, and a great variety of grubs or larvae. When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262 These were later thrown on hot coals and eaten
223 without being cleaned. Small birds no larger
222 than a sparrow are shot if the man can get near
[34] enough to use his bow and arrow. If they come to a burid stalk of the right size they will cut it
313 down, put it into the burden basket, and take it to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[177] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

It is certain that they are perfectly aware of this peculiarity. When one does not understand them and asks them to repeat, they exaggerate maliciously, and more each time, the style that is particular to them, and when one desists, discouraged, they laugh and exchange jokes. They have succeeded. This is especially true of young women who do not yet have children, and of young concubines. The mothers and older women stress these differences less, although one also finds them among this group upon occasion. Besides, the young women like the society of children and adolescents, play and joke constantly with them; and it is the women who take care of the animals in that very human way peculiar to certain South American Indians. All this contributes to creating a special atmosphere around the women, in the interior of the group, at the same time child-like, happy, affected and provocative, in which the men participate when they return from the hunt or the gardens.

But a completely different attitude is manifested among the women when they are to undertake some one of the forms of activity which are especially intrusted to them. They accomplish their tasks as artisans with ability and patience, in the solitary camp, arranged in a circle and with their backs to one another, and, during trips they valiantly carry the heavy basket which contains the provisions and riches of the whole family and the quiver of arrows, while the husband walks ahead with the bow and one or two arrows, the wooden spear or the digging implement, looking for the flight of an animal or a fruit tree. One sees these women then, the forehead bound with the tump line, the back completely covered by the wide basket in the form of an inverted bell, walking for kilometers with their characteristic step: [58] the thighs very tense, the knees together, the ankles turned out, the feet turned in; leaning on the outer edge of the foot and moving the hips, courageous, energetic and gay. We give on the opposite page a chart of the division of tasks between the sexes, but this division should be interpreted in a less strict manner than usual for phenomena of this type. Among the Nambikwara collaboration between husband and wife is carried so far that many tasks are done jointly. More exactly, if the man rarely intervenes in feminine tasks, the woman on the other hand (and above all the supplementary wives in case of polygamy) unceasingly aid their husband. We have indicated by crosses between parentheses the cases where a task attributed to one sex is occasionally practiced by the other. Thus, when they are alone or among themselves, the men do the carrying, but they do not carry from the forehead (xenaʔkititu, a).

000 old Paresí Indian village site on the west bank of the Papagaio. It is a division point in the telegraph line, and besides the telegraph operator there is a section boss and a number of Paresí Indian linemen. As the Nambicuara take whatever wire they feel they need, the linemen are kept busy repairing the line. There are 12 houses in the settlement proper with the buildings of the Protestant Mission forming one end of the town and the buildings of the Jesuit Mission forming the other.

[316]

The line boss, who is also the mayor of the town, gave Kazro and me a two-room mud-and-wattle house as our quarters. Our meals we took with the two American missionary families. The Catholic Mission was under the charge of Father Roberto, a Frenchman, and Father João, an Austrian. In addition, there were three sisters in charge of a school. The priests had developed extensive fields of manioc and rice, irrigating the fields by diverting water from the river. They had also set up an electric-light plant, using water as a source of power. There are tremendous possibilities for power development, for Utiarity Falls, situated some half a mile distant, has a drop of about 240 feet. Unfortunately this power resource is located in a practically uninhabited, semiarid region.

797
●484

The Rev. L. W. Buckman, who has been in the area since 1941, kindly consented to prepare a pack train, using the mission oxen and mules, to go in search of the nearest band of Nambicuara. On the third day after our arrival when our preparations were well along, however, a band of Nambicuara came to Utiarity. In fact they were able to get a ride on João Tapuya's trucks as he was returning from Burity, the end of the truck road. This was Julio's band of some 18 people known by the Nambicuara as the Wakiltisu. Their purpose was to bring one of their men who had running syphilis sores to the Jesuit Mission for treatment. This changed our plans, for we now had one of the four Eastern Nambicuara bands in camp, which would give us plenty to do for the limited period of our visit. Also during the first week, Father João returned from the Iranxe village, bringing five men, and offered to assist us in gathering whatever information we could get from them. This we found to be very difficult, as the Iranxe spoke no Portuguese and the mis-

000

361 [226] We do not know yet what determines these shifts to nearby locations; they may perhaps be caused by the death of an [748] Indian or by some communal misfortune. The distances involved are so small that the moves could not possibly derive from any significant ecological changes.

342 In order to keep rain water from seeping underneath the thatch, the Tagnani and Tawite Indians cover the inner ground perimeter of their conical huts with a series of overlapping plates made of jatobá shells.

The rain does not leak in.

354 It would not be fair to imagine the interior of the huts as hot and stuffy; air penetrates freely in between the leaves.

Nevertheless, the situation changes when the Indians light their small fires. Happily for them, the thatch is sufficiently permeable to keep their eyes free from the grave diseases often encountered among primitive peoples whose dwellings are smoky.

352 Household furnishings are rudimentary; except for the grids mentioned above and a few large pots, nothing else might properly be termed a piece of furniture. All other objects are tools, artifacts, [751] weapons and ornaments [227] [plates p. 222] which they carry with them on every journey, no matter how brief. Only the heavier mortars and graters, which cannot be carried easily, are left in the hut. These barbarians in turn could say: "Omnia mea mecum porto" [everything that is mine I carry with me].

Straw pallets, cured hides, hammocks, sleeping platforms, cots and true beds represent types of bedding characteristic of different stages of civilization.

513 The use of pallets already indicates a certain degree of advancement; but the Nambicuara have no bed other than the earth. They sleep on the bare ground.

They did not possess the hammock, that inseparable companion of their neighbors the Paresi; now that they are acquainted with it, they hold it in high regard. It was difficult to obtain any rest among them during the night; no sooner had we set up our hammock than three or four candidates would appear... And once they had taken over, it was hard to get it back. We were frequently awakened by Indians who forcibly asserted their desire to sleep in the hammocks we occupied.

[245] The Tagnani also use a kind of fish trap.

A rare type of blunt arrow is designed for the capture of birds which serve as playmates to Nambicuara children.

The birds are felled by the impact and caught easily. Some become used to their cruel captivity: a woodpecker (Colaptes campestris, Vieil) was occasionally imprisoned by a boy under a gourd. No sooner did the child remove the cup than the bird, instead of flying away, would perch upon him. It is true that the Indian nourishes his domesticated birds very well: he constantly feeds them from his own mouth, gently gorging them.

[Fig. 59]

To our intense surprise, as the cephalic measurements of an Anunze woman were being taken, a baby rat fell from the nape of her neck where it had apparently been living comfy, hiding in her hair as in the grass where it was born.

Doves (Chamepelia talpacoti), young vultures (Sarcoramphus papa, Catharista atratus brasiliensis, Bonap), monkeys and small owls are also domesticated in the Serra do Norte.

Before the days of the Rondon Commission, the Nambicuara were not familiar with the ox, the mule or the dog. They are still afraid of the ox because of its horns; they have a liking for the donkey, whose meat they find similar to that of the tapir.

[246] They are now good friends of the dog, which at first frightened them greatly; they steal a few whenever they can, and these dogs quickly take a fancy to [the Indians] because they are so well fed. In the master's eating gourd there is always room for the dog's muzzle.

They carry their children in a strap slung over the shoulder and across the chest, which the Cocozu make with straw and the others with cotton.

They take along everything they own on the shortest excursions; this is a nomadic habit surviving among a nearly sedentary people.

A population as large as that of the Serra do Norte would be unable to subsist exclusively on hunting and fishing. The Indians would be forced to travel far and wide in search of food; they would have been annihilated long ago, or else deprived of those characteristics which only their isolation could maintain.

Whenever they received good presents such as axes or beads, they would go to the brook and return with their whole face set ablaze by the blood-colored paint.

This practice was carried out on outsiders by the Tagnani as a mark of special esteem. We were all granted this honor in Três Buritis. . .

The men do not pluck their pubic or axillar hair; sometimes they even grow a sparse mustache or an even sparser beard. The women depilate themselves completely.

[244] The foot paths they use are narrow, similar to cow paths in pastoral regions; in certain areas, the ground is criss-crossed with them. They also make lanes in the woods by cutting branches.

To cross a small river they make a footbridge by cutting down a tree on the bank and guiding its fall in the right direction.

If the river is wide, they make a bundle of muriti leaves as a float and allow the current to carry them diagonally across the stream.

[Fig. 36]

They are not familiar with the canoe or with navigation; they are good swimmers.

They walk fast. They cover many leagues a day, always at a brisk pace--the "long stride" [marcha em extensão] of the physiologists--with the muscles taut, the body erect.

The hunting of big game--tapir, capybara, the Rondon Commission's horses and donkeys--is carried out in groups. For certain species they use special arrows that will be described later.

In fishing they do not use fishhooks, but special arrows. (1)

The Tagnani also use a kind of fish trap.

1. According to Ehrenreich the hook is not habitually used by the Indians because of the piranha fish (Pygocentrus sp.) which are so voracious that they do not allow the fisherman to gather in his catch. Nevertheless, a hook made of thorn--the so-called pindá dos tupis [Tupian fishhook]--is found in many areas.

carry water. Pottery, unknown to the eastern groups, is crude everywhere else. There are neither canoes nor dugouts. The Indians make five different types of musical instruments, all winds, which are often heard in festivals.

The difference in physical appearance between the Nambikwara and their eastern, western and southern neighbors—Parecis, Tupi-Kawahib and the tribes of the *Guaporé*—is striking. (2) And they

2. The anthropological study of the Nambikwara was the object of research of Dr. J.-A. Vellard, who was part of our expedition.

also differ from most of the other tribes of Brazil, whose physical type is generally more massive than theirs. In the case of the Nambikwara, the body is not exceptionally small; but they are slim, and their long hair, sometimes wavy and of more developed pilosity than the indigenous median, their hands and feet of reduced dimensions, their fine lineaments, and above all their faces, of characteristic outline but very purely chiseled, contribute to form a physical type far removed from that encountered most often in South America, but which reminds one persistently of certain types of southern Mexico and Guatemala, and even more of that characterized by the masks with pointed beards of the region of Vera Cruz.

• • • •

The Nambikwara get up at dawn, stir up the fires, warm themselves as well as they can after the cold of the night, then they eat lightly of the [16] remains of last evening's yucca cakes. A little later the men leave, together or separately, for a hunting expedition. The women remain in the camp where they devote themselves to culinary duties. The first bath is taken when the sun begins to come up. The women and children often bathe together for amusement, and sometimes a fire is lighted before which they crouch to warm themselves on coming out of the water while they playfully exaggerate a natural shivering. Other bathing takes place during the day. The daily occupations vary little. The preparation of food is that which requires the most care and time. Yucca must be ground and pressed, and the pulp dried and cooked. Or else the cumaru nuts (Dipteryx odorata) which add their perfume to most dishes must be shelled and boiled. When the need is felt, women and children go out on foraging expeditions. If the provisions are sufficient, the women spin, crouched

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP1?

and dots hanging down from the nape of the neck. A similar but shorter headdress may be worn in daily life. 301

Hair is groomed with a composite comb. It is cut with a shell, either all around the head at the level of the ear lobe, or only across the forehead, the back and sides being allowed to fall loose. Body painting consists mainly of urucú smeared uniformly, but some groups roughly trace black dots and stripes with genipa juice on the chest and legs. Face and body hair is generally pulled out, especially by women; men often have a sparse moustache and beard. 302 [386]

TRANSPORTATION

Canoes are unknown. Small waterways are crossed on a fallen tree; large ones by swimming, sometimes with the help of large floating bundles of buriti palm stems. Babies straddle their mother's hip supported by a large sling of bark or woven cotton. 481 501 354

MANUFACTURES

Spinning.—Women spin cotton with a crude drop spindle made of grass stalk. The whorl is a wild fruit, a potsherd, or a conical piece of sun-dried clay. Cotton thread is rolled in a ball and, like everything else in a *Nambicuara* household, wrapped in leaves. Women and men twist tucum and buriti fibers on their thighs to make string. 283

Weaving.—Weaving is limited to cotton bands and belts which men make on small, rough looms of the "*Arawak*" type (pl. 37, *center, right*). 286

Basketry.—Men make long, open-mouthed, cylindrical baskets using bamboo strips and a hexagonal, open weave. Fire fans are plaited of palm leaves. The *Northern Nambicuara* used palm leaves to weave low square baskets for storing the manioc and maize flour. 285

Pottery.—Pottery is unknown among the *Eastern Nambicuara*. In other groups, women make coarse pots of varying sizes. They mix the clay with ashes, fire the pot in the open, and wash it while it is still hot in an infusion of resinous bark. 323 [317]

Implements.—Stone ax heads were formerly fixed with wax and strings in the loop of a bent handle. Knives and drills are made of a crude flint chip or piece of iron fastened with wax and thread at the end of a piece of wood or between two pieces of wood, which form the handle. Women hollow small cylindrical mortars in tree trunks by means of fire. Fire is made with a fire drill, crude rubber serving as tinder. The Indians burn almecega (*Tetragastris balsamifera*) resin for light. Knives are thin, sharp-edged pieces of wood. 412 [372] [373]

Weapons.—The *Nambicuara* bow is about 5 to 7 feet (2 m.) long, the section being flat, semicircular, or concave according to the group. The grip is wrapped with cotton. The arrow is released between the thumb and the first finger, the three other fingers being placed on the 411

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

221 subsistence activities. For instance, they say that they eat the blossoms of certain plants and a great number of grubs, larvae, and insects. A [262 253] favorite dish is to crush in a mortar manioc cakes with boiled beans, broiled meat, ants, palm nuts, monkey and bird bones.

824 As an example of the variety of uses to which [262] the Nambicuara can put a plant we can take the buriti palm: (1) They eat the pulp surrounding [288] the scaly covered nut. (2) They use the fibers from the new growth to make twine. (3) They use the tough, flexible cortex of the frond stalk for making baskets. (4) They fell the buriti so that a certain variety of grub can collect and [262] multiply in the starchy pith in the heart of the tree. The grubs or larvae they then eat uncooked. •[501] (5) The dried frond stalks are tied into bundles and used as floats for crossing rivers. In addition, the buriti palm has male associations, for only [766] men can prepare its products. When a male child dies a piece of buriti fiber is left over his grave.

372 The Nambicuara make fire by the drill method. They cut two round pieces of dry stick about 18 inches in length and three-quarters of an inch in diameter from some bush that has a soft pithy center. The lower stick is split and into the flat side shallow notches are cut to hold the drill in place. The drilling stick is then inserted into the notch while the lower stick is held in place by the toes of the man as he squats over it. He then begins to twirl the stick between his palms, pressing downward. As his hands reach the bottom, he quickly brings them to the top and continues drilling until the pith in the lower stick loosens into small smouldering balls. These he places into a handful of dry buriti fiber and begins to blow on them until the fiber ignites. About 2 minutes is all that is required to make a fire by this method.

MANUFACTURING

412 The material equipment of the Eastern Nam-
415 bicuara is extremely simple. Many items, such as the conical trap for catching fish, the floats for crossing rivers, the loom for weaving arm bands, and the mortar and pestle for crushing food products are made for the occasion and are discarded when the task is completed or when the people move. The small grater and the few gourd vessels, small baskets, and twine, the woman carries

[p. 92(B)]

Whenever they received good presents such as axes or beads, they would go to the brook and return with their whole face set ablaze by the blood-colored paint.

THE SOCIAL USE OF KINSHIP TERMS AMONG BRAZILIAN INDIANS

By CLAUDE LEVI STRAUSS

121 607 THE kinship system of the Nambikuara Indians of the Western Matto Grosso is one of the most simple in Brazil. At the same time it is typical of a sociological pattern, cross cousin marriage, which according to our present information seems to have been very common throughout South America. The object of this article is to compare the familial organization of the Nambikuara with that of other tribes described in the older literature and to show that a certain kinship tie, the brother-in-law relationship, once possessed a meaning among many South American tribes far transcending a simple expression of relationship. This significance, still observable in Nambikuara culture, is both sexual and politico-social; and, owing to its complexity, the brother-in-law relationship may perhaps be regarded as an actual institution. Since the sixteenth century travellers and sociologists have failed to devote sufficient attention to the phenomenon, probably because it could readily be interpreted as a development of the imported Iberian *compadre* relationship. In our opinion, on the contrary, the brother-in-law relationship, together with its remarkable implications, constitutes an indigenous aboriginal institution based on the pattern of native culture. Nevertheless, it presents a striking example of convergence in which the native and Latin-Mediterranean institutions show numerous apparent similarities overlying important structural differences.

131 133 The Nambikuara Indians are settled on the upper courses of the feeders of the Tapajoz River, between the eleventh and the fifteenth parallels. Their territory consists of a semi-desert savanna, which contrasts with the narrow gallery forests along the main waterways. The fertile soil of these forests allows [511] the natives to cultivate a few gardens in the rainy season, but during most of the year the Nambikuara subsist mainly by hunting and gathering wild food. 177 Compared to the majority of Brazilian tribes, their cultural level is low. As they were discovered only in 1907 and as they had practically no contact with white civilization between the year of the Rondon-Roosevelt Expedition in 1914 and the time of our own field work in 1938–39, their familial and social organization may be considered still intact.

601 The Nambikuara kinship system may be summarized as follows: All the father's brothers are classified together with the father and are called "father," and all the mother's sisters are classified with the mother and are called "mother." The father's sisters and the mother's brothers are classified together with the spouse's parents and the parents' parents in a single category which denotes simultaneously the cross aunts and cross uncles, the mother-in-law and father-in-law, and the grandparents. Passing to Ego's generation, the parallel cousins, both the children of the father's brothers and of the mother's sisters, are merged with siblings and are called "brother" and "sister," Turn-

carry water. Pottery, unknown to the eastern groups, is crude everywhere else. There are neither canoes nor dugouts. The Indians make five different types of musical instruments, all winds, which are often heard in festivals.

The difference in physical appearance between the Nambikwara and their eastern, western and southern neighbors—Paresi, Tupi-Kawahib and the tribes of the Guaporé—is striking. (2) And they

2. The anthropological study of the Nambikwara was the object of research of Dr. J.-A. Vellard, who was part of our expedition.

also differ from most of the other tribes of Brazil, whose physical type is generally more massive than theirs. In the case of the Nambikwara, the body is not exceptionally small; but they are slim, and their long hair, sometimes wavy and of more developed pilosity than the indigenous median, their hands and feet of reduced dimensions, their fine lineaments, and above all their faces, of characteristic outline but very purely chiseled, contribute to form a physical type far removed from that encountered most often in South America, but which reminds one persistently of certain types of southern Mexico and Guatemala, and even more of that characterized by the masks with pointed beards of the region of Vera Cruz.

• • • •

The Nambikwara get up at dawn, stir up the fires, warm themselves as well as they can after the cold of the night, then they eat lightly of the [16] remains of last evening's yucca cakes. A little later the men leave, together or separately, for a hunting expedition. The women remain in the camp where they devote themselves to culinary duties. The first bath is taken when the sun begins to come up. The women and children often bathe together for amusement, and sometimes a fire is lighted before which they crouch to warm themselves on coming out of the water while they playfully exaggerate a natural shivering. Other bathing takes place during the day. The daily occupations vary little. The preparation of food is that which requires the most care and time. Yucca must be ground and pressed, and the pulp dried and cooked. Or else the cumaru nuts (Dipteryx odorata) which add their perfume to most dishes must be shelled and boiled. When the need is felt, women and children go out on foraging expeditions. If the provisions are sufficient, the women spin, crouched

512 [512] on the ground in the position known by the name "aztec"--on their knees, the legs and feet flat on their inner side and the buttocks resting on the heels. Or else they cut, polish and file beads from nutshells or sea shells, earrings or other ornaments. And if the work bores them, they pick the lice from one another, stroll around or sleep.

512 521 During the warmest hours the camp is silent. The inhabitants, silent or asleep, enjoy the uncertain shade of the shelters. The rest of the time, the occupations are carried on with animated conversations. Nearly always gay and laughing, the Indians exchange jokes, and sometimes, with unmistakable gestures, obscene or scatological accounts which are greeted with great shouts of laughter. The work is often interrupted by mutual visits or questions; when two dogs or birds copulate, everybody stops and contemplates the operation with fascinated interest; then work is taken up again, after an exchange of commentaries about this important happening.

512 The children lounge around during a great part of the day, the girls surrendering themselves at times to the same jobs as their elders, the boys idle or fishing along a stream of water. The men remaining in camp dedicate themselves to basketwork, making arrows and musical instruments, and sometimes to performing some small domestic service. Complete accord usually reigns within the household. Toward three or four o'clock, the other men return from the hunt, the camp becomes animated, the conversation becomes livelier, groups form, different from family agglomerations. They eat yucca cakes [262] and everything found during the day: fish, roots, wild honey, bats, 329 little animals captured, and small sweet nuts from the palm bacaiuva (Acrocomia sp.). Sometimes a child begins to cry, quickly [358] consoled by an elder. When night falls some women, chosen daily, go to collect or cut down in the neighboring woods the store of wood 512 for the [17] night. They can be seen returning in the twilight, 313 staggering under the load which pulls the tumpline used for carrying 462 it. To unload, they crouch and lean backwards a little, letting their bundle of bamboo rest on the ground in order to disengage the tumpline from their forehead.

512 In a corner of the camp the branches are amassed and each one supplies himself in proportion to his needs. The family groups form around their respective fires which begin to glow. The evening is passed in conversation, or else in singing and dancing. Sometimes these distractions are prolonged far into the night, but in general, after some amusements of caressing and friendly fighting, the couples draw closer together, the mothers clutch their sleeping infants to them, everything becomes silent, and the cold night is

[33] dividing line of waters which separates the basin of the Paraguay, a tributary of the La Plata River, and the sources of the Arinos River, itself a tributary of the Amazon.

In its general aspect, the region is a sort of vast undulating plateau, falling slowly in the direction of the basin of the Amazon, with the highest points in the center and in the south (about 800 meters) and the lowest (about 350 meters) toward the north and west. Nevertheless, the traveler leaving from the south is greeted by an impressive spectacle when, after having traveled through 1,200 kilometers of high desolate land, he reaches the northwest border of the plateau, compared to the lowlands the difference in altitude is small, 100 meters at the most, but the rise is abrupt. Behind him, he leaves an interminable and sterile brush, while immediately at his feet begins, with the valley of the Gi-Parana, the no less interminable Amazon forest. This remarkable geographic frontier is also the western limit of Nambikwara territories.

Farther to the center and to the north, the aspect is different; running waters have worn ditches across the plateau which become larger in the direction of the Amazon basin. These depressions bring about differences in altitude up to 150 meters. One notices them especially in the region which extends from the Roosevelt River to the Doze de Outubro River, and they give this region a falsely mountainous aspect from which the fallacious expression "Serra do Norte" probably originates.

[34] [32] Geological constitution conspires with climatic conditions to [5] give the plateau its desolate physiognomy. The sand, product of the decomposition of the sandstone, provides a sterile soil, and the irregular distribution of rain explains the prairie-like aspect, so characteristic of the whole region. Except for a little rain—very rare—which falls sometimes in July or August, the "chuvas de caju," one might say that the period from April to September is completely arid. On the contrary, precipitation is violent and almost daily from October to March. There are storms when the rain lasts sometimes one, two or even three consecutive days. During the rainy season the temperature rises; 42 to 44 degrees[1] during the day, cooler at night, with a sudden and brief shower at dawn. But abrupt variations of temperature rather characterize the dry season, probably because of intense nocturnal radiation. It is not rare, at this season, to go from a daytime maximum of 40 degrees to a nocturnal minimum of 8 or 10 degrees. The Indians, who live completely nude, sleep on the ground, [291] [313] and know nothing of the use of coverings either of cloth or fur, suffer cruelly from this circumstance.

[1] [i.e. degrees Centigrade.— Analyst]

knowing if the type of life of the Nambikwara, apparently very primitive, does or does not constitute the authentic vestige of ancient conditions. Considered in the present, their level of culture is certainly very low. They live naked, especially the women, who only wear a thin string of buriti beads around the waist, some earrings, necklaces worn around the neck or looped over the shoulder, [14] bracelets made from the tail of the large armadillo, and, sometimes, some narrow bands of cotton woven by their husbands, or some buriti straw, tightly bound around the biceps, and wooden pins. Besides the same ornaments, the men sometimes put on a sort of straw pompom, fastened to the waist above the sex organs, and smaller ones, attached to cotton bracelets; on the other hand, they do not wear shell bracelets. The complete ignorance of the hammock and the Nambikwara
● [513] custom of sleeping on the ground (or, more rarely, on long strips of the bark of the palm tree paxiuba) has intrigued ethnologists for a long time. This sentiment is shared by neighboring tribes, and the
[101] Paresi, mentioning this peculiarity, call the Nambikwara Uaikoahore, "those who sleep on the ground."

221 The Nambikwara year must be divided into two distinct periods. During the rainy season (from October to March), each group settles on some small elevation rising above the course of some stream. The Indians then construct crude huts with curious variations in form and materials. They burn clearings in the approaches to the forests which
221 occupy the humid valley floor, and there they plant and cultivate
241 gardens principally with the starch-yielding plants of the manihot genus (sweet and bitter) and tobacco, sometimes some peas, cotton, peanuts, and calabash (Lagenaria sp.). They grate the yucca (manioc) on planks covered with the sharp bark of the palm tree, they press it with the aid of a piece of twisted bark. The garden produce furnishes food resources sufficient for part of the sedentary period, and even of use later: the Nambikwara preserve the yucca by burying the residue of the 'grated' pulp in the ground.

221 At the arrival of the dry season, they abandon the village, or rather the site of temporary residence, and each group "breaks up," if one can say that, into several nomadic bands. For about seven

342 shelter and lights its own fire in the opening. During the rainy season,
[361] villages consisting of one or more beehive huts are built on slight hillocks above the course of a secondary stream. Some of the *Eastern Nambicuara* build only shelters, although larger and stronger than the ones described. The beehive hut is very light, each about 10 to 20 feet (3 to 6 m.) in diameter. The frame consists of several long, supple poles, bent so that both ends can be stuck into the ground and tied together at the top, where they cross. Circular branches running horizontally are tied to the poles at different levels. The *Central* and *Western Nambicuara* have a more elaborate hut (pl. 37, *top*) whose perimeter is about 50 feet (15 m.). It has a central post from the base of which several forked poles run obliquely to support the bent poles of the external frame. "All types of huts are thatched with horizontal layers of palm leaves, those of *Central* and *Western Nambicuara* exactly like the houses of their southern neighbors, the *Kepikiriwat*.

A gabled house without walls was also observed by Roquette-Pinto, who recorded other kinds of temporary huts. Some were built by sticking two branches into the ground, bending them over and attaching them to a horizontal pole tied to two perpendicular posts and covering them with bunches of grass."

352 The *Nambicuara*, although all their neighbors use hammocks, sleep on
●513 bare ground or on flat pieces of bark from the paxiuba palm. Because of this custom, the *Paressí* nicknamed them *Uaikoakôre*, "Those Who Sleep on the Ground."

CLOTHING AND ADORNMENT

[291] Both sexes are naked, except that men sometimes tie a small tuft of
301 buruty straw to their belt to cover the sex organs. Both men and women wear a thin, cotton-thread belt strung with white or black beads cut from river mollusk shells or from tucumã palm nuts. Such beads, with larger triangular pieces of mollusk shells, are also used for necklaces, earrings, bracelets, and other ornaments. Men wear grass or reed pins through their upper and lower lips; and, through their nasal septum, a larger pin made of a jacu (*Penelope*) feather mounted on a stalk covered with plaited cotton thread and porcupine quills and trimmed with a red toucan feather ring. Both sexes wear armlets and anklets of woven cotton, burity straw, feathers, parts of dried birds, fur, or mollusk or crawfish shells. Women wear one or more bracelets cut from the tail of the great armadillo and double bandoleers of plaited cotton dyed with urucú and decorated with porcupine quills. Hair ornaments are confined to men: circlets of plaited straw, of straw and and toucan feathers, or of fur with
[714] feather pendants. War dress consists of a jaguar-skin bonnet (pl. 36, *top, left*) with a long, plaited buriti-straw tail painted with red stripes And darts hanging down from the nape of the neck.

sionaries had not yet learned enough Iranxe to make working with informants possible.

As all of the following information, unless otherwise specified, relates to the Wakítisu band, a short description of this band is in order. Today the band consists of 18 individuals, of which Julio is the chief. About 5 years ago, before a measles epidemic decimated it, the band was roughly twice the size it is today. Julio is a man of middle age, has three wives and two children, and probably holds his leadership by being the strongest and ablest man in the band. Except for one of Julio's wives and her daughter who are Elótasu, the members of the band are Wakítisu and related to one another. Julio took the Elótasu woman from the Elótasu band by killing her husband. He claims he did this because the Elótasu chief stole one of his wives some years ago. He claims he is going to steal another wife, for every chief is supposed to have four. Only three other men, Martin, Marciano, and Joaquin, are married, each having one wife. The remaining four are either widowers or as yet unmarried.

Of all the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were the most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covered with some kind of scaly skin disease from head to foot, and another was deaf and dumb. The women and children, however, appeared to be healthy. Owing to the fact that they use no hammocks but sleep on the ground, they are always covered with dirt. On cold nights they remove the fires and sleep in the warm ashes. The Wakítisu wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat, makes proximity to them rather distasteful. They also appear to be heavily infected with internal parasites, for their stomaches are distended and they are continually passing wind. On several occasions when a number of them had crowded into the small room we used for working we had to cease work in order to air the room.

In their manners the Nambicuara also contrast sharply with the other tribes I visited. The

clude at least one stretch of river and the "galeria" forest which lines its banks. Except during the planting and harvesting season the members of the band are on the move up and down the narrow confines of the territory. Within this hunting territory they have camping places rather than villages. A semipermanent camp site where fields are cultivated for 2 or 3 years is known as *sinsiéu*. Any place where the band or a family may stop overnight is known as *siénsu*. At present the Wakĺítisu band has one house (*sísu*) at the place where it is farming. The entire band occupies the house, each family having its own fire around which it sleeps at night. The unmarried men gather around another fire. Julio informed me that their house is rectangular with stake walls and a gable roof covered with sapé thatch. Some years ago when the band was larger he said they occupied a different place on which they built three houses. These houses were built by placing a series of saplings into the ground to form an oval. The tops were then fastened to a ridge pole, the framework being covered with sapé or palm fronds. A smaller beehive-shaped house is made in the same way. Houses of this type are from 6 to 10 feet high. Near the living house they build a small flute hut (*sinedónkleu*) and, when the occasion demands, a shaman's hut (*sihdéntsu*).

If the weather is cold while they are out hunting the band or the family may build a temporary brush hut for the night. Sometimes only a windbreak (*siotdutsi*) is considered sufficient. On warm nights during the dry season the group camps under a tree. In favorite hunting places the same camp site will be used repeatedly. When the soil around the permanent camp site or village becomes exhausted, fields are cleared some distance away and small huts are put up for the workers. As the distance increases the old camp site is eventually abandoned and a new camp site is established.

As the Nambicuara do not use hammocks, beds, or seats, there is not much in the way of furniture in their shelters. Utensils are restricted to a few gourd vessels, tin cans, burden baskets and small flat baskets, fire fans, bows and arrows, and tools used by men. When they move, these articles are placed in burden baskets which are carried by the women. The Wakĺítisu do not

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéra, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákorê and Ouihanierê to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guaycurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoákorê, and who, as now stated, are Nhambiquára. This name of Uáikoákorê is given by the Parecí of the sub-tribes Kazinitî and Uaimaré of the rivers Arinos, Sacuriú-iná, Tahura-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Calaçal and Jauxú. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of coconut. They wear armlets, bracelets, leg ornaments and bead collars made from the fruit of the mbacúba. They live by the chase, but also plant maize, yams, potatoes, mandioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atsíri and the Amúésa of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kêtêhê of the Parecí, made from pounded mandioc. The native *breu* or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Oaniní and wax, and is preserved in leaves of the Malé-malá palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutúm feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 38 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malá-malá and breu. The upper disk has three orifices.

145 It seemed to me that these people get their full set of teeth much earlier.

Those molars which are popularly called wisdom teeth, and which are tending to disappear in the white race, are no mere ornaments among the Indians. They are endowed with significant size and function.

264 I believe that the excessive amount of work required of their
145 digestive system is reflected in these dental characteristics. The large molars appear earlier because they are needed for frequent and powerful mastication.

262 They always eat of everything, without discrimination or restraint. To my knowledge, there is no animal they will not eat. They discard only the intestinal tract of the game they kill.

[194] The Indians of the Juruena River consume more meat than the
[514] others; those from José Bonifácio eat more manioc and maize. Their intestinal gas makes their company unpleasant. They all have furred
164 tongues, and many have gums affected by alveolar piorrhea. Their teeth, contrary to frequent cases among the Sambaqui skulls, do not suffer from the state of wear which Lund described in 1842 for Lagoa Santa man; but they suffer from caries which do not spare the crowns.

A special skin disease prevails among the Indians of the Serra do Norte. (1)

[113]

1. See E. Roquette-Pinto, Lectures at the Biblioteca Nacional [National Library] on March 15, 1913, and at the Sociedade Brasileira de Dermatologia, Policlinica Geral do Rio de Janeiro [Brazilian Dermatological Society, Main Polyclinic of Rio de Janeiro], on June 11, 1912.

[181] Actually, some officials of the Rondon Commission had noticed the characteristic scabs of the disease. Owing perhaps to a lack of typical cases such as I witnessed, however, they took the spots
[513] to be mere skin exfoliations caused by the friction of the body on the ground, where the Serra do Norte Indians sleep.

302
751

Indians are as well protected against the actinic action of the sun as if they were wearing the thick clothing of the Sahara tribes. Because they are nude, however, the air circulates freely around their body, reducing the heat and hastening the evaporation of perspiration.

"If exposed to sunlight, in accordance with the property described above, urucu absorbs only slightly the heat of the sun, reflecting the red rays and also the heat rays. For this reason the white man or one with slight pigmentation, when smeared with urucu, does not perspire excessively as does the Negro under the same circumstances.

"In view of the properties ascribed to urucu by our experiments, and of the widespread usage of this dye among the Indians of tropical America, we believe that it should be considered not as merely ornamental but as an effective means of protection against tropical light and heat."

164 [184] The manifestations and evolution of the disease lead us to believe that it is a dermatomycosis. The habitat of the pathogenic fungus is probably to be found in the soil. This would explain why the personnel of the Line, who have lived among the Nambicuara for years, have not yet contracted the disease. This also applies to the Paressi, who are now in contact with the diseased Indians. Both groups, unlike [513] the Nambicuara, make use of hammocks and never sleep on the ground.

To this day, no microscopic examination of the scales has been made, and I am not responsible for this failure. In 1912 the Indians [123] would not allow us to collect the necessary materials; they were still suspicious.

361 [226] We do not know yet what determines these shifts to nearby locations; they may perhaps be caused by the death of an [768] Indian or by some communal misfortune. The distances involved are so small that the moves could not possibly derive from any significant ecological changes.

342 In order to keep rain water from seeping underneath the thatch, the Tagnani and Tawite Indians cover the inner ground perimeter of their conical huts with a series of overlapping plates made of jatobá shells.

The rain does not leak in.

354 It would not be fair to imagine the interior of the huts as hot and stuffy; air penetrates freely in between the leaves.

Nevertheless, the situation changes when the Indians light their small fires. Happily for them, the thatch is sufficiently permeable to keep their eyes free from the grave diseases often encountered among primitive peoples whose dwellings are smoky.

352 Household furnishings are rudimentary; except for the grids mentioned above and a few large pots, nothing else might properly be termed a piece of furniture. All other objects are tools, artifacts, [484] weapons and ornaments [227] [plates p. 222] which they carry with them on every journey, no matter how brief. Only the heavier mortars and graters, which cannot be carried easily, are left in the hut. These barbarians in turn could say: "Omnia mea mecum porto" [everything that is mine I carry with me].

Straw pallets, cured hides, hammocks, sleeping platforms, cots and true beds represent types of bedding characteristic of different stages of civilization.

513 The use of pallets already indicates a certain degree of advancement; but the Nambicuara have no bed other than the earth. They sleep on the bare ground.

They did not possess the hammock, that inseparable companion of their neighbors the Paressi; now that they are acquainted with it, they hold it in high regard. It was difficult to obtain any rest among them during the night; no sooner had we set up our hammock than three or four candidates would appear... And once they had taken over, it was hard to get it back. We were frequently awakened by Indians who forcibly asserted their desire to sleep in the hammocks we occupied.

7: Roquette-Pinto--26 E-4, 5 (no date)1938 SP17 Nambicuara SP17 (ca. 1912)

513 At the post of Três Buritis, where they camped with us for a few days, they disputed every night the occupancy of a crude wooden table where the station personnel ate their meals; they already appreciated our habit of sleeping above the ground.

Why, then, did they not make use of the hammocks? Because they were not familiar with it.

[248 824] They are capable of plaiting cotton and tucum (1) thread more

1. Bactris setosa (Ed.).

than adequately enough to make a hammock; and they are also capable of appreciating their neighbor's hammock, as indeed they do now.

This ethnographic trait attests to the inferior position of the Serra do Norte Indians.

[171] [228] This unfamiliarity [with the hammock] is in fact characteristic of the large Ge-Botocudo group of Brazil, which in the consensus of all who have studied it comprises the most backward aborigines in the Americas.

All Serra do Norte Indians sleep directly upon the earth. They spread nothing in the way of leaves, straw, pallets or hides between themselves and the ground.

They nearly always rest on their side, pillowing the head on the forearm.

516 The men rarely sit directly on the ground; they usually squat. The women do the reverse. If standing in one spot for more than a few minutes, a man will usually flex one leg and rest his foot against the other knee; the women assume a characteristic posture which I have never seen described and which is clearly shown on the photographs we took.

They cross their thighs, thrusting the right part of the pelvis forward and the left part forcibly backward. The longitudinal axis of the right foot, if extended, cuts that of the left foot almost at a right angle.

They frequently cross their arms.

201 When excited or roused by happiness or fear, they repeatedly slap the back of their head with their open right hand. When displeased, they make the same gesture while exclaiming: "Ikátnerá!"

595 husband and his first wife will also play, while bathing or near the
182 camp fire. She is in no way excluded from the gay life. Moreover, her slighter participation in relationships of amorous comradeship is compensated by a greater respectability and a certain authority over her young companions. It must not be forgotten (and we have
595 pointed it out in the study of the kinship system) that the polygamous
582 marriage presents a double aspect—the marriage of a man with a woman and with some "daughters" of the latter, or with a woman and the "sisters" of the latter. The respective situations of A1, a2 and a3 and a4 realize the two situations at the same time since, at least in one of the cases (with a4), it is the second oblique marriage within the same line. As example of the first type, we have the marriages of A32 and of A56; for the second type, one can also refer to the marriage of C20 (1).

1. Cf. above, p. 53.

595 The polygamous wives then, as a general rule, belong to a
571 younger generation. The first wife calls them "daughters" or of "little sisters," and they behave as such. A form of spontaneous grouping which one finds realized frequently is the union of the husband's daughters (by his first wife) and his young wives (polygamous). They form a sort of gay and carefree childlike society, but also a more or less subordinate society. We have found households comprised of two (A42, A57, A73, B1, B32, C20), three (A1,) and five (A32) wives. It does not seem that the number of wives is proportional to the social importance of the husband (even though polygamous union itself is conditioned by this), but is rather haphazard.

SEX LIFE

000 We shall begin by giving some information concerning organic activities.

514 Coughing, sneezing, spitting, blowing the nose, belching, ex-
515 pelling flatus, constitute operations which are not subject to any
576 etiquette, and which the vocabulary does not always clearly distinguish (thus: tolũrige, b1, to cough, and tolũtiore, b2, to sneeze; kasite, sneeze, and kasĩpe, c, spit. tarnĩkititu, a1, to expel flatus or to defecate). All of these needs are satisfied publicly, without precaution, ritual gesture or formula, as much on the part of the executor as on that of the spectators. No attention is paid to them, and everything

514
515 leads to the belief that the terms employed to designate them, so
576 easily interchangeable, refer to more general forms of behavior.

515 To blow the nose, one takes in both hands a twig or a stalk of dry grass, folds it in two, and pinches the nose in this improvised nut-cracker while blowing strongly. The mucus is collected by pinching the instrument together under the nose, and the whole thing is thrown away after having been plunged into the sand to dry it.

514 The men urinate standing or while walking. The women crouch, leaning slightly forward and sprinkle themselves with sand to dry themselves. The children act like the adults of their sex, except that the little girls often urinate standing up with their legs separated. The men defecate alone in the bush neighboring the camp, the women do the same, or go in a group. On such occasions one perceives the reality of the group formed by the girls and the secondary wives of polygamous marriages. Thus, a3, a4, a5, a8, a19, and a20 are accustomed to isolate themselves by twos, threes or fours. Elimination is done in a crouched position, in a hole summarily dug in the sand with the hands, or directly on the ground. A small branch is used to clean oneself, and sand, for drying.

841 The women are forced into isolation only at the time of their [63] first menstruation.(1). Following this, they are only subject to

1. Cf. below, p. 109.

certain alimentary and sexual prohibitions:

6. jaŋoõdage edẽdẽ edẽdẽ edẽdẽ kano kano kano kano kano kano kanaho huiire tamindige. (b1).
The woman has her menses every two moons (?), then she waits one day, one day, one day, one day, the next day she can eat, copulate.

The taboo on eating for five days is not rigorous, and usually concerns certain types of food. Besides this, a woman cannot bathe during her menses, as is, of course, the general rule for the two sexes during this period. One goes to the river to put water in a gourd and pours it over the body while crouching. Otherwise, the woman takes care of all her habitual occupations. No precaution is taken against
841 the flow of blood, and as no trace of it is noted, it must be supposed
147 that it is greatly reduced (2).

841
147
171 2. Among the Bororo, on the contrary, it is easily seen which women are indisposed. But the above remarks seem to be indicative of a fairly general state of affairs

833 lively jubilation. Comments are exchanged, jokes made, and even the young children share in the excitement whose motive they are well acquainted with. Sometimes even a small group of men, young women and children, take off in pursuit of the couple and watch the details of the operation through the branches, whispering among themselves and muffling their laughter. The principal actors do not appreciate these goings on at all. However, it is better to take part in them as well as to suffer the taunts and mockeries which greet their return to camp. It also happens that a second couple follows the example of the first and seeks, in their turn, the solitude of the bush. The Indians know and use two positions for coitus. We were not able to find out if they are practiced indiscriminately or if the choice depends on a rule. Whatever the case, besides the posterior position (toãtelosu, a1; inkolékenore, b1—to copulate from the rear) so frequent in South America, another position (uatalãdige, b1) can be described as follows: the woman on her back, the man facing her, the right leg only between the legs of the woman and the left leg outside, so that the two superimposed bodies give the general form of an X.

[66] PARENTS AND CHILDREN

593 163 847 The Nambikwara have few children. Couples without children are not rare, one or two children seem to be a normal number, and it is exceptional to find more than three in a household. Sexual prohibitions and the economic conditions on which they are based which also give rise to abortions, explain this situation. Apparently also Nambikwara formerly had the custom of beating to death the children whose mothers died during childbirth. According to the informants, this practice has been abandoned today.

853 855 The mother gives the breast lying on her side with the child pressed against her. These feedings have no fixed time. The child nurses when he wishes and as much as he wishes. Weaning takes place towards the end of the first year, but up to the age of two or three the infant returns from time to time to the maternal breast.

[514] When a child eliminates at the camp site or inside the hut, the father or mother carefully buries the excrement by digging a small hole which is quickly filled with dry sand. A great deal of care is taken to prevent the children from soiling the camp site and the objects placed near them.

145 It seemed to me that these people get their full set of teeth much earlier.

Those molars which are popularly called wisdom teeth, and which are tending to disappear in the white race, are no mere ornaments among the Indians. They are endowed with significant size and function.

264 I believe that the excessive amount of work required of their
145 digestive system is reflected in these dental characteristics. The large molars appear earlier because they are needed for frequent and powerful mastication.

262 They always eat of everything, without discrimination or restraint. To my knowledge, there is no animal they will not eat. They discard only the intestinal tract of the game they kill.

[194] The Indians of the Juruena River consume more meat than the
[514] others; those from José Bonifácio eat more manioc and maize. Their intestinal gas makes their company unpleasant. They all have furred
164 tongues, and many have gums affected by alveolar piorrhea. Their teeth, contrary to frequent cases among the Sambaqui skulls, do not suffer from the state of wear which Lund described in 1842 for Lagoa Santa man; but they suffer from caries which do not spare the crowns.

A special skin disease prevails among the Indians of the Serra do Norte. (1)

[113]

1. See E. Roquette-Pinto, Lectures at the Biblioteca Nacional [National Library] on March 15, 1913, and at the Sociedade Brasileira de Dermatologia, Policlinica Geral do Rio de Janeiro [Brazilian Dermatological Society, Main Polyclinic of Rio de Janeiro], on June 11, 1912.

[181] Actually, some officials of the Rondon Commission had noticed the characteristic scabs of the disease. Owing perhaps to a lack of typical cases such as I witnessed, however, they took the spots
[513] to be mere skin exfoliations caused by the friction of the body on the ground, where the Serra do Norte Indians sleep.

carry water. Pottery, unknown to the eastern groups, is crude everywhere else. There are neither canoes nor dugouts. The Indians make five different types of musical instruments, all winds, which are often heard in festivals.

142 The difference in physical appearance between the Nambikwara and their eastern, western and southern neighbors—Paresi, Tupi-Kawahib and the tribes of the Guaporé—is striking. (2) And they

2. The anthropological study of the Nambikwara was the object of research of Dr. J.-A. Vellard, who was part of our expedition.

also differ from most of the other tribes of Brazil, whose physical type is generally more massive than theirs. In the case of the Nambikwara, the body is not exceptionally small; but they are slim, and their long hair, sometimes wavy and of more developed pilosity than the indigenous median, their hands and feet of reduced dimensions, their fine lineaments, and above all their faces, of characteristic outline but very purely chiseled, contribute to form a physical type far removed from that encountered most often in South America, but which reminds one persistently of certain types of southern Mexico and Guatemala, and even more of that characterized by the masks with pointed beards of the region of Vera Cruz.

. . .

512 The Nambikwara get up at dawn, stir up the fires, warm themselves as well as they can after the cold of the night, then they eat lightly of the [16] remains of last evening's yucca cakes. A little later the men leave, together or separately, for a hunting expedition. The women remain in the camp where they devote themselves to culinary duties. The first bath is taken when the sun begins to come up. The women and children often bathe together for amusement, and sometimes a fire is lighted before which they crouch to warm themselves on coming out of the water while they playfully exaggerate a natural shivering. Other bathing takes place during the day. The 512 daily occupations vary little. The preparation of food is that which 252 requires the most care and time. Yucca must be ground and pressed, and the pulp dried and cooked. Or else the cumaru nuts (Dipteryx odorata) which add their perfume to most dishes must be shelled and 512 boiled. When the need is felt, women and children go out on foraging expeditions. If the provisions are sufficient, the women spin, crouched

512 [516] on the ground in the position known by the name "aztec"—on their knees, the legs and feet flat on their inner side and the buttocks resting on the heels. [306] Or else they cut, polish and file beads from nutshells or sea shells, [515] earrings or other ornaments. And if the work bores them, they pick the lice from one another, stroll around or sleep.

512 521 During the warmest hours the camp is silent. The inhabitants, silent or asleep, enjoy the uncertain shade of the shelters. The rest of the time, the occupations are carried on with animated conversations. Nearly always gay and laughing, the Indians exchange jokes, and sometimes, with unmistakable gestures, obscene or scatological accounts which are greeted with great shouts of laughter. The work is often interrupted by mutual visits or questions; when two dogs or birds copulate, everybody stops and contemplates the operation with fascinated interest; then work is taken up again, after an exchange of commentaries about this important happening.

512 The children lounge around during a great part of the day, the girls surrendering themselves at times to the same jobs as their elders, the boys idle or fishing along a stream of water. The men remaining in camp dedicate themselves to basketwork, making arrows and musical instruments, and sometimes to performing some small domestic service. Complete accord usually reigns within the household. Toward three or four o'clock, the other men return from the hunt, the camp becomes animated, the conversation becomes livelier, groups form, different from family agglomerations. They eat yucca cakes [262] and everything found during the day: fish, roots, wild honey, bats, 824 little animals captured, and small sweet nuts from the palm bacaiuva (Acrocomia sp.). Sometimes a child begins to cry, quickly [356] consoled by an elder. When night falls some women, chosen daily, go to collect or cut down in the neighboring woods the store of wood 512 for the [17] night. They can be seen returning in the twilight, 313 staggering under the load which pulls the tumpline used for carrying 482 it. To unload, they crouch and lean backwards a little, letting their bundle of bamboo rest on the ground in order to disengage the tumpline from their forehead.

512 In a corner of the camp the branches are amassed and each one supplies himself in proportion to his needs. The family groups form around their respective fires which begin to glow. The evening is passed in conversation, or else in singing and dancing. Sometimes these distractions are prolonged far into the night, but in general, after some amusements of caressing and friendly fighting, the couples draw closer together, the mothers clutch their sleeping infants to them, everything becomes silent, and the cold night is

595
601 sense of this term remains doubtful. And it has never been possible, in the course of the questions on kinship, to obtain from polygamous husbands discriminating terms for each of their wives.

595 established between the first wife and the new arrivals. The first
462 wife takes care of her children and devotes herself to the cares of
[252 the household, shredding the manioc and cooking the cumaru nuts.
262] She is occupied with feminine craft tasks. In short, she carries on her activities within the [61] limits of the sexual division of labor. The other wives aid her occasionally, but their main duty seems to be to assist their husband in his masculine tasks. They are comrades and collaborators who, in the general plan of the division of labor, could be more justifiably classed with the men. Their aid seems like a method on the part of the chief of the group to fulfill his heavy duties more easily, and like a psychological compensation for his responsibilities. When he leaves on a hunting or reconnoitering expedition, one of his polygamous wives accompanies him to hold his arrows and to carry in her basket the eventual prize. When he works around the camp or in the village, it is with their aid and com-
● [515] pany. Although men and women do not bathe at the same time, one sometimes sees the husband and his polygamous wives take a bath together, the pretext for great struggles in the water, and innumerable
[832 jokes. In the evening he plays with them, either amorously, rolling
524] in the sand embracing two, three or four, or in a childlike way. For example A1, a3 and a4, stretched out on their backs, by way of making a star with three points on the ground, raise their feet in the air and knock them against one another, bottom of foot against bottom of foot, in a regular rythm (this game is described by the term eridna(kitim, al).

595 The polygamous union is thus presented as a super-imposition
182 of a plural form of amorous companionship on the monogamous marriage, and at the same time, we insist, as an attribute of command with a functional value from the psychological point of view as well as from the economic. The women usually live on very good terms, and although the first wife has a role that might seem a little unappreciated, working while she hears at her side the bursts of laughter of her husband and of his little mistresses, and sometimes even witnesses more tender frolicking, she does not show either bitterness or jealousy. In fact, this distribution of roles is not either unchangeable or rigorous, and, upon occasion, although rarely, the

595 husband and his first wife will also play, while bathing or near the
182 camp fire. She is in no way excluded from the gay life. Moreover, her slighter participation in relationships of amorous comradeship is compensated by a greater respectability and a certain authority over her young companions. It must not be forgotten (and we have
595 pointed it out in the study of the kinship system) that the polygamous
582 marriage presents a double aspect—the marriage of a man with a woman and with some "daughters" of the latter, or with a woman and the "sisters" of the latter. The respective situations of A1, a2 and a3 and a4 realize the two situations at the same time since, at least in one of the cases (with a4), it is the second oblique marriage within the same line. As example of the first type, we have the marriages of A32 and of A56; for the second type, one can also refer to the marriage of C20 (1).

1. Cf. above, p. 53.

595 The polygamous wives then, as a general rule, belong to a
571 younger generation. The first wife calls them "daughters" or of "little sisters," and they behave as such. A form of spontaneous grouping which one finds realized frequently is the union of the husband's daughters (by his first wife) and his young wives (polygamous). They form a sort of gay and carefree childlike society, but also a more or less subordinate society. We have found households comprised of two (A42, A57, A73, B1, B32, C20), three (A1,) and five (A32) wives. It does not seem that the number of wives is proportional to the social importance of the husband (even though polygamous union itself is conditioned by this), but is rather haphazard.

SEX LIFE

000 We shall begin by giving some information concerning organic activities.

514 Coughing, sneezing, spitting, blowing the nose, belching, ex-
515 pelling flatus, constitute operations which are not subject to any
576 etiquette, and which the vocabulary does not always clearly distinguish (thus: tolitige, b1, to cough, and tolitiore, b2, to sneeze; kaite, sneeze, and kaitpe, c, spit. tarnikitiru, a1, to expel flatus or to defecate). All of these needs are satisfied publicly, without precaution, ritual gesture or formula, as much on the part of the executor as on that of the spectators. No attention is paid to them, and everything

514
515 leads to the belief that the terms employed to designate them, so
576 easily interchangeable, refer to more general forms of behavior.

515 To blow the nose, one takes in both hands a twig or a stalk of dry grass, folds it in two, and pinches the nose in this improvised nut-cracker while blowing strongly. The mucus is collected by pinching the instrument together under the nose, and the whole thing is thrown away after having been plunged into the sand to dry it.

514 The men urinate standing or while walking. The women crouch, leaning slightly forward and sprinkle themselves with sand to dry themselves. The children act like the adults of their sex, except that the little girls often urinate standing up with their legs separated. The men defecate alone in the bush neighboring the camp, the women do the same, or go in a group. On such occasions one perceives the reality of the group formed by the girls and the secondary wives of polygamous marriages. Thus, a3, a4, a5, a8, a19, and a20 are accustomed to isolate themselves by twos, threes or fours. Elimination is done in a crouched position, in a hole summarily dug in the sand with the hands, or directly on the ground. A small branch is used to clean oneself, and sand, for drying.

841 The women are forced into isolation only at the time of their [63] first menstruation.(1). Following this, they are only subject to

1. Cf. below, p. 109.

certain alimentary and sexual prohibitions:

6. iayoũdage edẽdẽ edẽdẽ edẽdẽ kano kano kano kano kano kanabõ huiise tamindige. (b1).
The woman has her menses every two moons (?), then she waits one day, one day, one day, one day, the next day she can eat, copulate.

The taboo on eating for five days is not rigorous, and usually concerns certain types of food. Besides this, a woman cannot bathe during her menses, as is, of course, the general rule for the two sexes during this period. One goes to the river to put water in a gourd and pours it over the body while crouching. Otherwise, the woman takes care of all her habitual occupations. No precaution is taken against
841 the flow of blood, and as no trace of it is noted, it must be supposed
147 that it is greatly reduced (2).

841
147
171 2. Among the Bororo, on the contrary, it is easily seen which women are indisposed. But the above remarks seem to be indicative of a fairly general state of affairs

855 and he is left alone a whole day. When evening comes, however,
157 his mother cares for him tenderly, removes lice from him while he sleeps, signals to others not to approach, and makes for him a sort of cradle in her arms.

854 A young mother, c21, plays with her baby giving him little slaps
157 on the back. The baby begins to laugh, and she gets excited by the game to such an extent that she hits him harder and harder, so that he cries. Then she stops and consoles him.

736 We saw the little orphan girl a9, whom everyone loves, literally trampled during a dance. She had fallen in the general excitement
858 of the celebration without anyone paying any attention. On the other hand, when they are opposed, children readily strike their
865 mother, and the latter does not fight back. Children are never
861 punished, and we have never seen one of them spanked, nor even the
853 gesture made, except as a joke. Sometimes, a child cries (1) because
515

1. The tears of a child are not called by the same name as those shed ritually by adults in the course of mourning. In the first case: to weep, nãsere, nãdige; in the second: to weep, doriãgeɨere (b1).

he has hurt himself, was in a fight, or is hungry,

10. ũtsotnaniena naũdnerajena indõtenajena ũneere (b1)
the child cries, he is thirsty, he is hungry, he wishes to eat,

or because he does not want to be deloused. But this last case is rare, for delousing seems to charm the patient as much as it amuses the operator. It is also held to be a mark of interest and affection. When he wishes to be deloused, the child—or the husband—places his head on the woman's knees, presenting the two sides of his head in succession. The operator proceeds by parting hair or looking through the strands. The louse that is caught is immediately crushed. The child who cries is quickly consoled by [68] a member of his family or by an older child. In general, they have little to com-
[861] plain about. Very pampered, rarely scolded, never whipped, they live free, useless and lazy.

854 Also, the sight of the mother and her child is usually full of gaiety and freshness. The mother holds an object out to the baby through the straw of the shelter and withdraws it at the moment the baby thinks he has it:

sionaries had not yet learned enough Iranxe to make working with informants possible.

As all of the following information, unless otherwise specified, relates to the Waklĭtisu band, a short description of this band is in order. Today the band consists of 18 individuals, of which Julio is the chief. About 5 years ago, before a measles epidemic decimated it, the band was roughly twice the size it is today. Julio is a man of middle age, has three wives and two children, and probably holds his leadership by being the strongest and ablest man in the band. Except for one of Julio's wives and her daughter who are Elótasu, the members of the band are Waklĭtisu and related to one another. Julio took the Elótasu woman from the Elótasu band by killing her husband. He claims he did this because the Elótasu chief stole one of his wives some years ago. He claims he is going to steal another wife, for every chief is supposed to have four. Only three other men, Martin, Marciano, and Joaquin, are married, each having one wife. The remaining four are either widowers or as yet unmarried.

Of all the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were the most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covered with some kind of scaly skin disease from head to foot, and another was deaf and dumb. The women and children, however, appeared to be healthy. Owing to the fact that they use no hammocks but sleep on the ground, they are always covered with dirt. On cold nights they remove the fires and sleep in the warm ashes. The Waklĭtisu wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat, makes proximity to them rather distasteful. They also appear to be heavily infected with internal parasites, for their stomaches are distended and they are continually passing wind. On several occasions when a number of them had crowded into the small room we used for working we had to cease work in order to air the room.

In their manners the Nambicuara also contrast sharply with the other tribes I visited. The

301 imitate our wedding rings; necklaces [242], several meters long, made of black beads; the feathers of black birds; the limbs of coleopters, also black; all attest to this preference.

[Fig. 45]

[237] The women make beautiful one-piece bracelets from the tail rings of the giant armadillo which they polish with wet stones. [See Fig. 65, p. 59A]

[184] The Uaintaçu Nambicuara, who come to Campos Novos by way of the Guaporé and who are much more insolent, crude, wary and suspicious, do not attempt to wear the delicate lip plugs used by their relatives.

Some of them wear a porcupine quill fastened to their lip; others, a wooden splinter or a spike from some tree.

291 562 Also characteristic of the whole Serra do Norte and Juruena Valley is a palm-fiber cape (ialaçu), which hangs down the backbone from the neck. [See Fig. 66, p. 59B.] Women do not wear it; it is another example of male foppishness.

302 Body painting with urucu constitutes part of the ornamentation for men as well as for women.

[Plates, p. 236]

[243] They paint themselves on festive occasions; they do not [515] draw lines on the skin, but smear the dye all over their face. Women, after bathing, redden their whole body in this fashion.

[Fig. 44]

[386] The Indians of the Juruena dissolve the urucu powder in pure water; the Tagnani prepare a paste or cream by mixing the dye with the fat of various animals, and perfume it quite pleasantly by way of some unknown process. (1)

1. The Bororo use mastic resin to perfume the urucu paste. See Alfredo de Andrade, "Estudo dos materiaes corantes [A Study of Coloring Materials]," Archivos do Museu Nacional, Vol. 28, p. 183.

carry water. Pottery, unknown to the eastern groups, is crude everywhere else. There are neither canoes nor dugouts. The Indians make five different types of musical instruments, all winds, which are often heard in festivals.

The difference in physical appearance between the Nambikwara and their eastern, western and southern neighbors—Paressi, Tupi-Kawahib and the tribes of the Guaporé—is striking. (2) And they

516

Serra do Norte Indians

513 At the post of Três Buritis, where they camped with us for a few days, they disputed every night the occupancy of a crude wooden table where the station personnel ate their meals; they already appreciated our habit of sleeping above the ground.

Why, then, did they not make use of the hammocks? Because they were not familiar with it.

[245 824] They are capable of plaiting cotton and tucum (1) thread more

1. Bactris setosa (Ed.).

than adequately enough to make a hammock; and they are also capable of appreciating their neighbor's hammock, as indeed they do now.

This ethnographic trait attests to the inferior position of the Serra do Norte Indians.

[171] [228] This unfamiliarity [with the hammock] is in fact characteristic of the large Ge-Botocudo group of Brazil, which in the consensus of all who have studied it comprises the most backward aborigines in the Americas.

All Serra do Norte Indians sleep directly upon the earth. They spread nothing in the way of leaves, straw, pallets or hides between themselves and the ground.

They nearly always rest on their side, pillowing the head on the forearm.

● 516 The men rarely sit directly on the ground; they usually squat. The women do the reverse. If standing in one spot for more than a few minutes, a man will usually flex one leg and rest his foot against the other knee; the women assume a characteristic posture which I have never seen described and which is clearly shown on the photographs we took.

They cross their thighs, thrusting the right part of the pelvis forward and the left part forcibly backward. The longitudinal axis of the right foot, if extended, cuts that of the left foot almost at a right angle.

They frequently cross their arms.

201 When excited or roused by happiness or fear, they repeatedly slap the back of their head with their open right hand. When displeased, they make the same gesture while exclaiming: "Ikátnerá!"

593 The conversation becomes animated and laughter spreads. In the dark
182 prairie the camp fires burn. Around the fire, the only protection
462 against the cold which descends, behind the frail windbreak of palms
[342] and branches hastily planted in the ground on the side where wind or
[415] rain is expected; near the baskets filled with poor objects which constitute their whole earthly treasure; lying on the ground which extends around, haunted only by other bands equally hostile and fearful, the couples, embracing tightly, are truly seen as the support of one another, the comfort, the only help against the daily difficulties and the dreamy melancholy invades the Nambikwara soul from time to time. The visitor who camps in the brush with the Indians for the first time feels tenderness as well as anguish and pity before the spectacle of this humanity so completely unprotected; crushed, apparently against the soil of a hostile land by some implacable cataclysm; naked, shivering around the hesitant fires. He circulates tip-toe among the underbrush, in the dark, avoiding crushing in his walk a hand, an arm, a trunk, whose warm reflections are seen by the light of the fires. But this misery is animated by whispering and laughter. [56] The couples clasp one another as in the nostalgia of a lost union. Their caresses, at the same time tender and candid, are not interrupted by the passage of the stranger. One senses in all
[157] of them an immense gentleness, a profound carelessness, a naive and charming animal satisfaction, and, emanating from all that, something like the most moving and credible expression of human tenderness.

593 Thus it is not surprising that the attitude of the two sexes as con-
831 cerns one another is characterized by intense interest. This interest
462 is translated in certain cases by the vocabulary. In fact the Nambikwara
562 have only one word to express "pretty" and "young," and a single word to
[517] signify "ugly" and "old" (munjene, jeʔene, bl). Their esthetic judgments are thus based essentially on human considerations, and above all, sexual ones. But the interest which is manifested between the sexes is of a complex nature. Men judge women in a mass, as being a little different from themselves. Depending on the situation, they consider them with desire, admiration, or tenderness. In itself the confusion of terms pointed out above constitutes permanent homage. But it must not be forgotten that the form of economic adaptation realized by sexual division of labor a capital role attributes to the women, since family life rests to a very large degree (probably the greatest) on the collecting of the women, but it represents an
[183] inferior type of activity. The ideal life is conceived on the model of agricultural production or hunting. To have plenty of manioc, and

513 [516] on the ground in the position known by the name "aztec"—on their knees, the legs and feet flat on their inner side and the buttocks resting [306] on the heels. Or else they cut, polish and file beads from nut- [515] shells or sea shells, earrings or other ornaments. And if the work bores them, they pick the lice from one another, stroll around or sleep.

512 During the warmest hours the camp is silent. The inhabitants, 521 silent or asleep, enjoy the uncertain shade of the shelters. The rest of the time, the occupations are carried on with animated conversations. Nearly always gay and laughing, the Indians exchange jokes, and sometimes, with unmistakable gestures, obscene or scatological accounts which are greeted with great shouts of laughter. The work is often interrupted by mutual visits or questions; when two dogs or birds copulate, everybody stops and contemplates the operation with fascinated interest; then work is taken up again, after an exchange of commentaries about this important happening.

512 The children lounge around during a great part of the day, the girls surrendering themselves at times to the same jobs as their elders, the boys idle or fishing along a stream of water. The men remaining in camp dedicate themselves to basketwork, making arrows and musical instruments, and sometimes to performing some small domestic service. Complete accord usually reigns within the household. Toward three or four o'clock, the other men return from the hunt, the camp becomes animated, the conversation becomes livelier, groups form, different from family agglomerations. They eat yucca cakes [262 and everything found during the day: fish, roots, wild honey, bats, 824] little animals captured, and small sweet nuts from the palm bacaiuva (Acrocomia sp.). Sometimes a child begins to cry, quickly [856] consoled by an elder. When night falls some women, chosen daily, go to collect or cut down in the neighboring woods the store of wood 512 for the [17] night. They can be seen returning in the twilight, 313 staggering under the load which pulls the tumpline used for carrying 482 it. To unload, they crouch and lean backwards a little, letting their bundle of bamboo rest on the ground in order to disengage the tumpline from their forehead.

512 In a corner of the camp the branches are amassed and each one supplies himself in proportion to his needs. The family groups form around their respective fires which begin to glow. The evening is passed in conversation, or else in singing and dancing. Sometimes these distractions are prolonged far into the night, but in general, after some amusements of caressing and friendly fighting, the couples draw closer together, the mothers clutch their sleeping infants to them, everything becomes silent, and the cold night is

857 b5, who insists that the treatment that one gives the small ani-
609 mal to divest it of its hair be applied to the ethnologist:

21. nẽiuyenãghẽẽ nẽuyẽẽguedne (b1)
Put his beard in the fire! Roast his beard!

857 In general, they are to be good companions, enthusiastic, and
157 untiringly avid for games that are shown them. In exchange, they are very obliging informants once they have become friends. Al-
[551] most all the information which we were able to gather concerning proper names comes from them.[1]

231 This chapter cannot be ended without presenting some observations relating to domestic animals. Not only do the children actually live in very intimate relationships with the animals, but the latter are treated in the family like real children at least outwardly. We mean that they share the group's food, benefit from the same manifestations of tenderness or interest—delousing, games, conversation, caresses—as the human beings. In everything, their treatment is [73] curiously the same. The Nambikwara have numerous domestic animals, first of all dogs, and cocks and hens, who are all descendants of those introduced in their region by the Rondon Commission; monkeys, parakeets, birds of various kinds, and finally, the caetetu, the coati (Nasua sp.), the jaguatirica. Only the dog seems to have acquired an
[224] occasionally utilitarian role in the service of women, for hunting with the digging stick (cf. quotation No. 16). The men never use them for hunting with bow and arrow. The other ani-
231 mals are raised for the purpose of pleasure. They are not eaten,
262 the people do not consume the eggs of the hens who lay them in the bush. But they do not hesitate to devour a young bird if it dies after a vain attempt at acclimatization.

The terms used for behavior regarding animals are the same as those used for humans. They say dehẽna uẽtte uẽkɔrage, "the woman caresses the baby," or uãinuẽtte uẽkɔrage, "the woman caresses the puppy."

231 While traveling, except for the animals capable of walking,
482 the whole menagerie is packed with the other baggage. The monkeys, attached to the women's hair, adorn them with an amusing living helmet, elongated by the long tail curled around the neck of the bearer. The parakeets and hens perch on top of the baskets, other animals are held in the arms. None of them receive abundant nourishment but, even in days of need, they
231 521 have their share, however little it may be. As compensation, they are an endless subject of distraction for the group, the

[1] [i.e. From the children.--Analyst]

231 principal spectacle for amusement. One hears such exclama-
521 tions as:

22. ɨakhũninde ɾteru ɰirokũnene (b1)
The flying ants! He (the monkey) catches them to eat!

They talk to the monkey while giving him fruits: ɰosɾ, "take!" and as the monkeys live very intimately with the dogs, they laugh hilariously seeing their goings on:

23. hõte ɰãinde miramiraɨna hõte ɰairɾdnɨena (b1).
The monkey mounts the back of the dog! The monkey bites the dog!

and again:

24. kuɣariɨena tãkɲlahẽ tãkela ãɣoriʃẽ kãdaɨena (b1).
It is balancing head down, head down it balances, it fell! (the monkey).

231 The children like to play at burning animals, and when
857 insects are involved, they are allowed to do so; but if they try
[865] to burn domestic animals by touching them surreptitiously with a piece of smoldering wood, they are severely reprimanded.

[74] THE GRANDPARENTS

603 We use the term in the classificatory sense, that is, the members of the third ascendant generation. In general, there are few—two in restricted group a1, five out of 75 persons in the enlarged group, three out of 31 in enlarged group b1 (in this estimate we do not include A1, a2 and a14, who can be classed as grandparents indirectly). This small number is
[765 explained, in part, by the very high mortality rate of the
887] Nambikwara, and partially also by the fact that aged persons, although participating in the nomadic life, do not move with the same mobility as the other members of the group, and are met more rarely. Whatever the case may be, the grandparents share the life of their descendants. The founding of a new family does not erase the ties between adults and their parents. We have underlined several examples while studying the phenomena
[592] of residence. Aged or widowed parents join the household of their son or daughter, either permanently or temporarily. Thus, in the absence of his son-in-law (A21) and of his wife (a18), A17 installs himself with his daughter (a22) and her baby (a23). She is the one who cooks manioc and cumaru nuts for the three.

802 a special term ba is found, to designate a duo or a pair.

NAMES OF NUMBERS

Numbers	Dialects a 1/2.	Dialect b 1.	Dialect b 2.	Dialect c.
One.....	kənãge	nãgɔna, kanãkero	najukənada-ĩsaore	amẽro
Two.....	searu	nabaãm, baãdo	baãsore	balẽne
Three.....	nuneseare-kənage	nabãgɔna	uãinsore	balaãmero
Four.....	desanu	nabaũda	uaidnaĩsore	
Five.....	dasarẽnere	nmba-nmba-nagena	nikuãinsore	
Six.....	anere		uãidna-ãĩsore	
Seven.....	toãidenere			
Eight.....	uakesauntnere			
Many.....	sãklaere	uãignine kuãintege	deindarĩsore	ãlele

[116] In the a 1/2 vocabulary, the terms indicated for "four" to "eight" probably represent less the names of the number than the descriptive terms of the operation which consists of adding a new unit to a whole. In the b2 vocabulary, the original word employed for "three" is apparently connected with the same origin as that of dialect b1 signifying plurality. The terms used for "four," "five" and "six" are probably descriptive of the manipulation.

●[521] In conversation, the exclamatory forms are used, for example in discussions among men upon their return from hunting:

55. nãgɔnaarenĩani baãneniani baãnegɔreniani bãde-bãdeniani baabãakənaãniani. (b1)
"I killed one myself--two, myself--three, myself--four, myself--five, myself."

In older versions, the old women (since
the old women share the magic powers of the men among the Nambikwara 773
as also in other tribes) (4) was undoubtedly not content with measuring the 171
[789]

4. Cf. above, p. 101.

fall of water by the duration of the fall of her nuts, she actually provoked it [538]
by throwing them. Whatever the case may be, "magical projection" is
probably found at the origin of the theme of the throwing of small fruits or
grains in South American folklore.

[122] PSYCHOLOGICAL ATTITUDES

The Nambikwara offer the observer a very special psychological 157
and moral aspect, and one which we have not found again either among
their immediate neighbors--Paressi, tribes of Guaporé, and Tupi of the
Gi-Parana--or among other South American tribes. It is worth an attempt
to separate its principal characteristics. Few of the primitive South
Americans display so much spontaneity and freedom in their behavior. Few
manifest such ease in psychological relationships, and such grace of ex-
pression. Thus, in their relationships with the ethnologist, the informants
introduce formulae which constitute true sociological inventions in order to 157
respond to a new situation, on the part of individuals who do not use either 571
a formula of greeting or of leave-taking in their own social relationships:

60. tai undeiretnĩẽ ta eikiredniẽ uẽi iiren undetniẽ
tatiene uẽi iritiani. (b1)
I am going to sleep, I am going away, you go to sleep,
I will stay, you go away.

Or to put an end to an interrogation of which they are weary:

61. ieitiana amnentiẽ hikonariana iatiena amdeniẽ
konahdian iedetniẽ. (b1)
This is useless, it must be left; one does not see
clearly any more, this is useless, let us leave it;
tomorrow we will talk.

Or again:

62. nakanaiõniani nihin nalitiani. (b1)
I have forgotten, wait till I remember.

Their daily life is full of exuberance. It is not only in the games 157
of ball that one hears joyous exclamations: 521

63. tenũkyẽ tenũkyẽ utanãtiri (bl). 157
To me! To me! Throw! 521

However the artisan at work also makes his wife, child,neighbor participate in the execution of the work on whose vicissitudes he comments gaily:

64. itiõĩ taninjẽ diuĩn...ãmi...kãdaha...munja'lina... kãdjanene...nooja...taluunlẽ...nohin...ishena... mũnjena. (bl)
Hold it [the cord] so that I can twist it...let it go! It fell!...There!...It is difficult!....It is done!....Does it suit you?..It is ugly!...No, it is pretty!

The last formula is ritual, it is the one they use at the end of chants and dances; the protagonists excuse themselves: "it is ugly"; and the audience responds: "No, it is pretty!" [788]

[123] This politeness is not always without malice, and compliments sometimes hide attempts at mockery. We cited above the formula used by a group to depreciate their dances in comparison to those of their companions they have just met; (1) but a few hours earlier, disdaining a present of beads 157 521 576

1. Cf. p. 92.

which I offered and which were not much appreciated because of their color, they advised me:

65. mpaĩin mai'mãĩndẽ tumahĩãde (bl)
Keep them to give to the Maimandẽ.

One day we were sold poison tubes (by group a2) described as so dangerous that we should abstain from ever opening them under pain of immediate death. They proved to be empty, which testifies to great ingenuity if the mystery was improvised on our account. In any case, it throws a curious light on the relationships between neighboring groups. 439 791 157

534 (arɨtasu-ahɨtu), and the connection remains suspect, the Nambikwara
789 not disdaining puns. (1) The same thing goes for the flutes of Pan,
[12]
● [522] 1. For example, A1 mocks me when I am in the process of smoking: Kɨkedetu ɨkedetu: a smoker is lazy.

sometimes called du²ɨtu (a1/2) du²ɨnde (b1) which would also be the name of the animal agouti (Dasyproctas aguti). It is no less true that
[533] several of the songs collected have been pointed out as songs of the hunt or of the harvest. A soldier of the Rondon Commission, prisoner of the Nambikwara for quite a long time, described to Roquette Pinto (2) a ceremony composed of dances and songs which had

2. Loc. cit., p. 234-235.

followed a tapir hunt. And a musical theme was pointed out to us spontaneously as the song of the tapir hunt.

FROM BIRTH TO DEATH

844 The Nambikwara woman gives birth (to be born: talɨ'ttige, b1) in a crouching position and getting support on the ground by means of a vertical pole which she holds with both hands. During this time a companion pours cold water over the chest and stomach with a small gourd. The umbilical cord is cut close and cauterized with a live coal, then covered with a salve of warm ashes.

47. dɔ̃ɔ̃ sa²kɨdutu²ɨkedɨtelusu alɔ̃ɔ̃ usɨ'nkedjutu inkɨtu jakesɨ'jutu ire ire iagɨkediutu (a1)
[When] the woman gives birth the placenta is buried in the bush; she is ill, she does not eat [for] a moon, a moon [and then] she eats again.

846 After the ceremony of burying the placenta, consequently, the woman would remain for two months under a taboo and condemned to relative abstinence. In reality, an exceptional situation is prolonged much longer, the period of abstinence observed by the husband and wife until the child is weaned, or at least until he ceases to be exclusively nourished by the mother's milk.

To describe the state of abstinence (inkɨtu, "one is ill" [a1]: there is no special term), we can do no more than to transcribe our observations made from day to day relative to the family of fire 6 composed of A21, a22, and a23. a22 is clearly distinguished from her companions:

595
601 sense of this term remains doubtful. And it has never been possible, in the course of the questions on kinship, to obtain from polygamous husbands discriminating terms for each of their wives.

595 established between the first wife and the new arrivals. The first
462 wife takes care of her children and devotes herself to the cares of
[252 the household, shredding the manioc and cooking the cumaru nuts.
262] She is occupied with feminine craft tasks. In short, she carries on her activities within the [61] limits of the sexual division of labor. The other wives aid her occasionally, but their main duty seems to be to assist their husband in his masculine tasks. They are comrades and collaborators who, in the general plan of the division of labor, could be more justifiably classed with the men. Their aid seems like a method on the part of the chief of the group to fulfill his heavy duties more easily, and like a psychological compensation for his responsibilities. When he leaves on a hunting or reconnoitering expedition, one of his polygamous wives accompanies him to hold his arrows and to carry in her basket the eventual prize. When he works around the camp or in the village, it is with their aid and com-
[515] pany. Although men and women do not bathe at the same time, one sometimes sees the husband and his polygamous wives take a bath together, the pretext for great struggles in the water, and innumerable
[832 jokes. In the evening he plays with them, either amorously, rolling
524] in the sand embracing two, three or four, or in a childlike way. For example A1, a3 and a4, stretched out on their backs, by way of making a star with three points on the ground, raise their feet in the air and knock them against one another, bottom of foot against bottom of foot, in a regular rythm (this game is described by the term eridnaikititu, a1).

595 The polygamous union is thus presented as a super-imposition
182 of a plural form of amorous companionship on the monogamous marriage, and at the same time, we insist, as an attribute of command with a functional value from the psychological point of view as well as from the economic. The women usually live on very good terms, and although the first wife has a role that might seem a little unappreciated, working while she hears at her side the bursts of laughter of her husband and of his little mistresses, and sometimes even witnesses more tender frolicking, she does not show either bitterness or jealousy. In fact, this distribution of roles is not either unchangeable or rigorous, and, upon occasion, although rarely, the

838 Because of the fact of partial polygamy which reigns within
[595 the group, and which is manifested in the fact that the youngest
582 and prettiest women are periodically withdrawn by the chief or
605 the shaman from the regular cycle of marriage, the young men often find themselves in difficulty as regards marriage, at least during part of their adolescence, no potential wife being available. This problem is resolved by homosexual relationships, which the Nambikwara language (b1) has named poetically: tamindige kihãdige, that is false love. These relationships are frequent among young people and are carried on much more publicly than normal relations. The couples do not retire to the bush as the adults usually do. They install themselves near a fire of the camp under the amused eyes of the neighbors. The incident gives rise to some joking comments, usually not carried very far. These relations are considered infantile, and hardly any attention is paid them. The question remains unanswered for us as to whether these practices are carried on to complete satisfaction, or are limited to sentimental effusions, accompanied by erotic play such as those which characterizes, for the most part, relations between husband and wife. Whatever the case may be, the essential point here is that homosexual relations are exclusively relations between cross cousins. Whenever one seeks information from an Indian concerning a relationship of the type just described, the typical response obtained is:

25. tarutebãdige tamĩndige (b1)
(those are) two brothers-in-law making love.

838 We have not been able to ascertain if these relationships of
605 adolescence continue between adults. It seems hardly probable.
607 But relationships of a very special nature are maintained between "brothers-in-law. They exhibit great familiarity toward one another, have among themselves effusions such as we have never noted among brothers or relatives of another degree. Among the
[201] Nambikwara (always prodigious, of course, with affectionate gestures) it is not rare to see two or three men, married and fathers of families, walking in the evening tenderly embracing. The information obtained is, here too, always the same:

26. tarũte ialhasi?ete. (b1)
The brothers-in-law are embracing.

607 Certain games, like the "the game of claws (griffes)"
524 (kaiobĩtunubi, c) are frequent among brothers-in-law.

622 The command carries, moreover, a certain number of fixed offices. It is the chief who makes the poison for arrows; and he presides over ceremonies of initiation, of marriage or burial, concerning which we shall speak later. He organizes chants and dances, festivals both when they assume a ritual character, and when they have as a goal purely secular distraction. It is he who organizes 622 ball games. The ball game is widespread in western and northern 526 Mato Grosso, for it is found from the Paressi to the tribes of the Lower Guaporé. Among the latter people we have been able to gather evidences of its sociological significance. It is perhaps the same among the Nambikwara; but, at least during the period of nomadic life, the ball game is practiced with a purely recreational goal in mind. The teams are built up haphazardly from those present and upon the spur of the moment, and the game takes place in a spirit of complete improvisation.

WAR AND TRADE

648 The two subjects should be treated simultaneously, commercial 609 exchanges usually representing potential wars peacefully re-[91] 439 solved, and the wars, the outcome of unhappy transactions. Among the numerous bands which cross through the bush during the dry season, it is necessary to distinguish those who are related by family ties, and who often represent the population of a winter village—or of a group of villages—which has "burst forth" in the pursuit of the nomadic life. Among themselves these bands entertain relationships which are normally pacific, although not necessarily so. On the contrary, bands which are strangers to one another, composed of members not related among themselves and whose geographic location is far distant, or who are even separated by differences of language, mistrust one another at the same time that they feel themselves necessary to one another. Only when they meet can they procure desirable articles which only one of them is capable of obtaining or of making. These articles seemed to us to belong essentially to three categories: first of all women, whom only victorious expeditions are permitted to [283] carry off. Next seeds, notably bean seeds, and finally ceramics, or [284] even fragments of pottery used to make the weights of spindles. Group a1 whose cultural level is clearly inferior (especially in its ignorance concerning pottery) to that of its western and southern neighbors, according to the word of its chief, had carried on several campaigns during the last few years with the goal of procuring these two last articles.

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

115
157 A1. --The chief of the group. He is a man of about 35 years, married to three women: a2, by whom he has a daughter a5, and a3 and a4, both daughters of "sister," without child.

A1 is remarkably intelligent, conscious of his responsibilities, active, enterprising and ingenious. When we went to visit his village, he did not hesitate to follow a new itinerary, unknown to him, because our horses could not pass along the habitual path. And when we arrived at the village, we found the stakes necessary to tie our oxen and horses, which he had had set up by a party sent a few hours ahead of time.

His attitude concerning writing is very revealing. He immediately understood his role of signing (1), and the social superiority which it

531
212

1. The Nambikwara of group a are completely ignorant of drawing, if one excepts a few geometric tracings on gourds. For several days they did not know what to do with the paper and pencils which we distributed to them. A little later, we saw them deeply engrossed in tracing wavy lines. In doing this they were imitating the only use which they had seen us make of our note pads, that is, for writing, but without understanding the purpose and significance.

531
212

Besides, they called the act of writing: iekariukediutu (a1), that is "make lines," which for them had an esthetic interest:

(3) Kihikagnere mũʔiene (b1).
It is nice to make lines.

[177] The drawings reproduced in Figure 19 thus constitute a cultural innovation inspired by our own drawings.

622 confers; also [41] he asked us for a note pad and a pencil, and we
115 are likewise equipped when we travel together. He does not com-
157 municate to me verbally the information that I ask of him, but traces on his paper some wavy lines and presents them to me as though I should read his response. But he himself is half duped by his comedy. Each time that his hand finishes a line, he examines it anxiously, as if the significance should miraculously spring forth, and each time, the same chagrined disillusion is painted on his face. But he doesn't give in. And it is silently understood between us that his scrawl possesses a meaning which I pretend to understand. Naturally, the verbal commentary follows almost immediately, and excuses me from having to demand some very necessary clarifications. When we discuss command, we shall return to certain aspects of this semi-mystification.

He is a valuable informant who understands the problems, perceives the difficulties, and is interested in the work; but his functions absorb him often, and he disappears for whole days on a hunting expedition, a survey of itinerary or a localization of ripe seed or fruit trees. On the other hand, his wives often call him to tender love games in which he lets himself be voluntarily involved.

In a general way, his attitude shows a logic, a continuity of purpose, very exceptional among the Nambikwara who are often unstable and temperamental. Placed in other conditions and with other means at his disposal, he might be a valuable organizer. And he is, after all, alone responsible for the destinies of his group, which he conducts with competence, although in a sometimes utopian spirit.

The father and the mother of A1 are dead. But his father's brother and mother's sister, whom he calls ahyĩnosu and aʔkenosu live in the same village (A65 and a66).

115 a2. --About 30 to 35 years. The eldest of the wives of A1, mother of a5, daughter of a18 and a now dead father. She is serious industrious, a little reserved in social relations. In the triple household

789 Poison is thus nãnde par excellence, although the latter can exist in other forms, at the same time less precise and more complex. We attach extreme importance to the fact that a rigorously utilitarian technique of the manufacture of poisons is found associated with a theory which accounts for their effectiveness through the intermediary of metaphysical concepts. The presence among the Nambikwara of a curare reduced to a basic product, and whose preparation excludes all ritual, associated with the very low cultural level of these Indians, poses in a particularly impressive way the question of finding out if these characteristics which are very primitive are so by origin or constitute the residue of an impoverished culture. Now, it is much more reasonable to interpret the apparent contradiction of theory [121 174] and practice in matters of poison by the loss of complex rituals which farther north are attached to the making of curare, than it would be to explain how a theory of supernatural character could have been built on the bases of treatment which has remained purely experimental, of the root of the strychnos.

Besides the notion of nãnde we should examine another which is the object of a particularly advanced elaboration among the eastern groups, that of the atãsu (a1). Atãsu signifies animal, but the use of the term by the Indians is complex. First of all it is the animal taken in a generic sense, in opposition to the inanimate. They present me with a honey cake and, pointing out the body of a bee which is still in it, I ask what it is. They do not answer, "it is a bee" but: atãsu, "it is the animal." Atãsu also means real animals, but ones without their own names in the vocabulary, and which are of particularly fearful character. Thus oxen are called by this name by the Nambikwara who never saw any [99] before the years 1910-1915, and who entertain a great fear of them. Then we find the same term to designate the stars (eastern groups), and the same name is given to the ticktock of the clock, both conceived of as realities animated by mysterious characteristics. Finally, atãsu is a special animal of supernatural essence, which is seen appearing in two cases—at night, on the road, in certain places and during certain periods, and upon the approach of death. In the first case, one risks being attacked and killed by the atãsu if one does not defend oneself 789 411 in the appropriate manner. This means is found in the throwing stick [épieu] (distinct from the digging stick), thrown in a prescribed manner. The throwing stick, a large piece of wood of flattened form [286 531] and pointed at the end is furnished with a handle usually decorated with black and white bark weaving (javelin: hĩ'dosu [a1], keẽũẽre

SP17 Nambicuara SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads.

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet.

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being pressaged by its appearance the following day.

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts.

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony.

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony.

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance.

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it.

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups.

752 They spread saliva on bâanêcedútú sores with the palm of the hand. They squeeze insect bites between two fingers.

757 Those suffering from fever go quietly into a corner, when they do not leap into running water. They eat nothing as long as the seizure lasts.

In the village on the Juina River there was an old Indian of about sixty. He was sad and prostrate and was not cheered by our gifts. He would put his hands to his head to show that it was aching. A lad who seemed [251] to be his son judging by the extreme affection he bestowed on the old man, contrary to the other Indians, kept offering him honey with water. Each time the old man would turn away. In the afternoon, his condition not having improved, he called the boy and said something to him.

The lad grasped the man's head in his hands and put his mouth against the nostrils, sucking hard. It seems that this suction which he repeated later was helpful, for the old man became more expansive.

[Fig. 41]

853 Childbirth must be easy, considering how poorly the foetus is nourished. The Indian women, when they do not have sufficient milk, take a drought of water in their mouth and put their lips onto those of the baby, transferring the liquid in a nourishing kiss.

844 I wanted to know how they cut the umbilical cord and showed several Indians who were more outgoing and intelligent--Damasceno, Nuleke, Krikriceknerá--a drawing in a book that showed a foetus with its attachments. From Damasceno's replies I understood that the mother cuts the cord with her teeth and hides the placenta under some leaves.

This piece of information obviously remains subject to revision.

The fact is that purely comical and sometimes childish appearances [157] 797 177 648
sometimes cover attitudes which, without being contradictory to the preceding, are nevertheless very different. The history of the eastern group, in the course of [134] these last years, is very significant in this regard. From 1909 to 1920, the installation of the telegraph line was marked by periodical conflicts alternating with cordial contacts, but in 1925, seven workers of the line were invited to visit (for the first time) the villages of the right bank of the Juruena River where we went later in 1938, and they disappeared there. From this time on, the contacts of the eastern group with the posts of the Rondon Line were interrupeed, but in 1933 a Protestant mission was installed not far from the post on the Juruena. It seems that from the beginning relationships were quite strained, the Indians not being satisfied with the presents, very insufficient, they say, by which the missionaries paid for their help in the construction of the house and the planting of the garden. Whatever the case may have been, in 1933 a feverish Indian presented himself at the mission, and publicly received two capsules of "Cafiaspirin" which he took, after which he went to take a bath in the river, had a congestion and died. Through expert practitioners, the Nambikwara concluded that he

752 They spread saliva on bâanêcedútú sores with the palm of the hand. They squeeze insect bites between two fingers.

757 Those suffering from fever go quietly into a corner, when they do not leap into running water. They eat nothing as long as the seizure lasts.

[532] [252] Snakes and saurians are sometimes drawn sketchily(1)

113 1. See E. Roquette-Pinto, "Documentos para o estudo da psicologia dos Indios do

534 (aratasu-ahatu), and the connection remains suspect, the Nambikwara
789 not disdaining puns. (1) The same thing goes for the flutes of Pan,
[92]

[522] 1. For example, A1 mocks me when I am in the process of smoking: Kukedetu ukedetu: a smoker is lazy.

sometimes called duʔuru (a1/2) duʔunde (b1) which would also be the name of the animal agouti (Dasyproctas aguti). It is no less true that
[533] several of the songs collected have been pointed out as songs of the hunt or of the harvest. A soldier of the Rondon Commission, prisoner of the Nambikwara for quite a long time, described to Roquette Pinto (2) a ceremony composed of dances and songs which had

2. Loc. cit., p. 234-235.

followed a tapir hunt. And a musical theme was pointed out to us spontaneously as the song of the tapir hunt.

FROM BIRTH TO DEATH

844 The Nambikwara woman gives birth (to be born: talittige, b1) in a crouching position and getting support on the ground by means of a vertical pole which she holds with both hands. During this time a companion pours cold water over the chest and stomach with a small gourd. The umbilical cord is cut close and cauterized with a live coal, then covered with a salve of warm ashes.

47. dosu sajkedutu ʔakedatelusu alosu usiʔnkedjutu inketu jakesajtutu ire ire iagekediutu (a1)
[When] the woman gives birth the placenta is buried in the bush; she is ill, she does not eat [for] a moon, a moon [and then] she eats again.

846 After the ceremony of burying the placenta, consequently, the woman would remain for two months under a taboo and condemned to relative abstinence. In reality, an exceptional situation is prolonged much longer, the period of abstinence observed by the husband and wife until the child is weaned, or at least until he ceases to be exclusively nourished by the mother's milk.

To describe the state of abstinence (inkatu, "one is ill" [a1]; there is no special term), we can do no more than to transcribe our observations made from day to day relative to the family of fire 6 composed of A21, a22, and a23. a22 is clearly distinguished from her companions:

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

533 **Music and dance.**—Music is clearly tonal, with melodic structures easy to identify. The end of a melody is usually marked with several shrill sounds which are repeated after each coda. Music is both instrumental and choral and usually accompanies dances.

535 Dances are performed under the leadership of the chief. Men and women stamp rhythmically on the ground while turning in a circle. Usually, dancers close one nostril with the left hand to make their singing nasal. Only men perform war dances, forming one or more rows and stepping forward and backward in front of the leader. In the second phase of the dance, they attack a post, a symbolical enemy, with bows and arrows, and clubs. Most of the dances and songs are connected with hunting or seasonal ceremonies, but they may be used at any time for mere entertainment.

534 **Musical instruments.**—Flageolets have four holes and an air duct; three are usually played together, accompanied by a rhythm trumpet made of a piece of bamboo with a hollow calabash fixed to its bottom. Nose flutes (pl. 36, *top, right*) are made of two pieces of calabash glued together with wax and pierced with three holes. One hole is blown with one nostril while the other nostril is closed with the thumb; the other two holes vary the notes. Nose flutes are also played in unison. Double and treble whistles have the air duct cut in the middle of the pipe, so that they can be blown at either end. Panpipes (pl. 36, *bottom, left*) are of two kinds: the common type has five pipes; the other type consists of two or three reeds cut obliquely at the mouth-end. All pipes produce approximately the same note in the latter.

272 273 **Drinks and narcotics.**—Drinks are made with crushed manioc or maize mixed with water, or of palm fruits, especially *Mauritia* sp., *Acrocomia* sp., and *Oenocarpus distichus*. A slightly alcoholic beverage is prepared of wild pineapples mixed with water.

276 The *Nambicuara* are ardent smokers. They cultivate a tobacco with tiny leaves, which they dry between two pieces of wood, crush with their hands, and store in small calabashes. Cigarettes are rolled in special leaves and tied with grass.

MAGIC AND RELIGION

771 The *Nambicuara* believe in the existence of a diffuse power or substance which may occur in objects and in living beings. It is manifest mostly in poisons, some of which are real (see Weapons, p. 366), some purely magical. To the latter belongs the rosin of the barrigudo tree (a Bombacaceae), which is kept in tubes like the true poisons. When thrown by a special technique at an enemy, it is believed to make him swell like the trunk of the tree and die.

776 There are also dangerous spirits of the bush and of water, which may appear in the shape of an animal, especially the jaguar, or in a

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

by singing calls his *anúnsu*, who eventually comes up out of the ground in front of him. The *anúnsu* may be in the form of a bird or a jaguar, but is very small in size. The shaman wears a hat made from a jaguar skin and a necklace made from jaguar claws and teeth. The shaman offers the hat and the necklace to his *anúnsu* if he will do his bidding. If the *anúnsu* is satisfied with the singing and the decorations he will carry out the shaman's orders. The procedure followed in curing an individual who has been made ill by sorcery is much the same. The shaman calls his *anúnsu* by singing and asks that he help him draw out the object. The *anúnsu* enters the shaman, who then sucks out the dangerous object. In mild cases the shaman draws out bamboo slivers, but in cases of severe illness he draws out the bones of fish or the entrails of birds.

The ghosts of the dead (*aydnkadisu*) who live around the stone mountain from which the Nambicuara came, periodically come to the villages and camps asking for food. They are not dangerous if they are well-treated. When the shaman says that the *aydnkadisu* are around, the people prepare manioc cakes, roast ears of maize, and broil meat. They then gather around the shaman and sing together with the ghosts. The shaman thanks the ghosts for their singing and they finally go away. If the ghosts are dissatisfied with the offerings and the singing they become angry and make the children ill. To cure the children, a more elaborate feast has to be prepared for the ghosts.

In every case, contact with the ghosts of the dead or with the spirits of dead shamans is made through singing. The Waklítisu do not use tobacco, drums, or rattles to communicate with the supernatural. One becomes a shaman when he hears the song of an *anúnsu*, which he later uses whenever he wishes to contact his spirit helper. Everyone in the band appears to know the songs which bring the *aydnkadisu*. Shamans practice continence before important rites, for if the *anúnsu* observe sexual intercourse they become angry and take away all the cotton from the bushes.

In addition to treating illness through shamanistic practices, the Nambicuara resort to more practical methods. They brew herbs, the juice of which is later poured over the head or stomach of a

757 patient. The juice of a certain plant is put into the cavities of teeth to stop toothache. The juice of boiled roots and leaves are taken internally for stomach disorders. One day I observed a woman pressing her foot over her husband's forehead as he lay on the ground. The heel was placed over the eye and she exerted considerable pressure. She was doing this to cure her husband's headache. These nonmagical practices are known to everyone. Some herbal medicines, however, are known only to the shamans and are used under the directions of the *anúnsu*.

778 534 The sacred flutes (*wdinrhu*) are associated with *okkihditlisu*, the culture hero, agriculture, and chieftainship. As these flutes are similar in appearance to the sacred flutes of the Paressí, among whom they have great significance, it is possible that the Nambicuara obtained them originally from the Paressí. The flutes are about 2 feet long with four holes at the lower end and are made from a jointless piece of bamboo. When the band settles down near their manioc fields they build a special hut for the flutes, but when they are wandering around, the flutes are hidden in the [784] woods. Women are not permitted to see the flutes, and if one should accidently see them her stomach would swell and she would become ill. But what appears more important is the fact that the flutes poison people who do not treat them well. Yet, as only the chief and the head shamans play them this would mean that the flutes are the symbols of authority representing the men in whom power is invested. The flutes, four of which should be in every band, do not represent a spirit but appear to be more like fetishes. Boiled manioc juice is poured into them and they are offered maize and broiled meat.

241 775 533 The *wdinrhu* are played after the fields have been planted and again at harvest time. After planting, the men gather into the flute hut and play the flutes and sing the *weiydnsu*. The ghosts of the dead participate and, along with the flutes, are offered food and drink. At harvest time another ceremony called *kaikdnakidutsu* is performed at night during which the flutes are played and special songs are sung. The following day the whole band participates in a dance. The ghosts also take part in this ceremony.

534 In addition to the *wdinrhu* flutes, the Nambicuara have a smaller four-stop bamboo flute called

535 The circling began at seven o'clock in the evening, with continuous chanting. The girls, not once deviating from their course, left regular marks on the dusty ground which were clearly visible in the moonlight. They seemed always to step in the footprints of the first round. Midnight. Near the fires lit by every family, the old people slept; some muttered and poked the embers which gleamed like scattered rubies. Within the circle, perspiring, covered with dust, more dead than alive, we all joined in the chorus: "Tagnaní-i! Tagnaní-i! Tangrê!"

Thus it went on all night. Whenever one of us fled and repaired to his hammock, two or three big husky fellows would come talking volubly, and drive the deserter back to his place...

[321] Unfortunately the words of those chants were not recorded. We only know the two words cited: tagnani, the name of the tribe, tangre, which means "star." Was this astrolatry? The three central figures of this dance, in the course of which stars were mentioned, brought to my mind [255] the beautiful constellation of Orion with its Três Marias ["Three Maries"--the Belt].

533 I recorded two Cocozu musical pieces which are rendered here [pp. 73-74]. Prof. Astolpho Tavares has transcribed them into musical notation.

[Fig. 34]

The scale [diapasão] of Nambicuara music is about half a tone lower than our normal scale.

The notes used in the recorded pieces are: do^1, mi^{2b}, fa^2, fa^2, sol^2, la^2. Neither re nor si appear.

The recorded pieces are in la flat major shifting to mi flat minor (Recording No. 1), and in mi minor (Recording No. 2).

The musical motifs develop in two-part time.

184 The Serra do Norte Indians present two distinct kinds of social organization. From this standpoint, the Tagnani and Tawite are more advanced than the Cocozu and Anunze.

593 The latter live under a patriarchal regime: the father rules the [511] family, which is often monogamous. The children, after puberty, start new families according to their own wishes [a vontade] and continue to revere their progenitors.

000 carry water. Pottery, unknown to the eastern groups, is crude every-
323 where else. There are neither canoes nor dugouts. The Indians make
184 five different types of musical instruments, all winds, which are often
501 heard in festivals.
534
142 The difference in physical appearance between the Nambikwara
[101] and their eastern, western and southern neighbors—Paressi, Tupi-Kawahib and the tribes of the Guaporé—is striking. (2) And they

2. The anthropological study of the Nambikwara was the object of research of Dr. J.-A. Vellard, who was part of our expedition.

also differ from most of the other tribes of Brazil, whose physical type is generally more massive than theirs. In the case of the Nambikwara, the body is not exceptionally small; but they are slim, and their long hair, sometimes wavy and of more developed pilosity than the indigenous median, their hands and feet of reduced dimensions, their fine lineaments, and above all their faces, of characteristic outline but very purely chiseled, contribute to form a physical type far removed from that encountered most often in South America, but which reminds one persistently of certain types of southern Mexico and Guatemala, and even more of that characterized by the masks with pointed beards of the region of Vera Cruz.

• • • •

512 The Nambikwara get up at dawn, stir up the fires, warm them-
515 selves as well as they can after the cold of the night, then they eat lightly of the [16] remains of last evening's yucca cakes. A little later the men leave, together or separately, for a hunting expedition. The women remain in the camp where they devote themselves to culinary duties. The first bath is taken when the sun begins to come up. The women and children often bathe together for amusement, and sometimes a fire is lighted before which they crouch to warm themselves on coming out of the water while they playfully exaggerate a natural shivering. Other bathing takes place during the day. The
512 daily occupations vary little. The preparation of food is that which
252 requires the most care and time. Yucca must be ground and pressed,
[824] and the pulp dried and cooked. Or else the cumaru nuts (Dipteryx odorata) which add their perfume to most dishes must be shelled and
512 boiled. When the need is felt, women and children go out on foraging
[516] expeditions. If the provisions are sufficient, the women spin, crouched

621 feather ornaments, hair styles, arms, such as we have seen among
115 neighboring or faraway peoples. Did he entertain the hope of per-
157 fecting the material and intellectual equipment of his group thanks
622 to this information? It is possible, even though his dreamy tempera-
177 ment hardly ever drives him to realizations. However, one day when
601 we were interrogating him concerning the Pan pipes, to verify the area of diffusion of that instrument, he answered that he had never
[534] seen any, but that he would like to have a drawing (different from group a, group b does not have real pipes of Pan, but instruments made of two or three tubes of equal length and giving approximately the same note, tied together with cotton thread and wax). With the aid of our sketch he succeeded in making a crude but usable instrument.

621 B1 had two wives: b2, about 25 years, mother of two little
601 girls of 5 to 7 years, b4 and b5: and b3, older than he (about 40 years old), mother of a boy of 7 years, B6, and of a girl of 9 years, b7.

Fire 2 (8 and 9). --A son of a deceased brother of B1, whom the latter then calls "son" (about 25 years old), and his wife about 18, sister of B13; no information about the father and mother.

Fire 3 (10 to 12). --B10 is a brother of B8, and B1 calls him "son" also. His wife, b11, of undetermined parentage, is about 20 years old, and his daughter b12 about 6.

Fire 4 (13 and 14). --This household presents the only sure case of oblique marriage in group b1. B13, about 25 years, married a girl of 16 or 17, b14, daughter of a dead son of the dead brother of B1; he calls her then, as seen before, tasuite.

Fire 5 (15 to 17). --These three individuals are the last survivors of a related group destroyed by an epidemic. After the disaster, they joined the band of B1. B15, about 35 years, is the brother of b2, thus tarute of B1. His wife, the same age, b16, is a sister of B1, thus ndedere of b2. Their son, B17, is about 5. The daughters of B1 call him (B17) "husband," and he calls them "wives."

621 [52] The visitors. --They came from the region lying between
574 the sources of the tributaries of the left bank of the Juruena and of
601 those of the right bank of the Guaporé. All were related to their hosts, and were distributed among three generations. The oldest was comprised of three individuals: B18, about 50 years old, father of B21, B25, B27, and B29; his wife b19, the same age, paternal aunt of B1; and the brother of the wife, B20, 40 years. Besides the children of B18 already mentioned (from 20 to 30 years old), the next

857 iõndage ʔutẽnturu kajãno kajãn kajãn hõte kajãnde ʔutentere kuaikano (b1).

When I am big, I shall catch the caetetu, caetetu, caetetu, the monkey, the caetetus, I shall kill them when it (the dog) barks.

[368] She makes an error in grammar which the father points out
857 laughingly: she should have said tilõdage, "when I am big,"
154 instead of the masculine form she used. The error is interesting, placed in context, which manifestly shows a feminine desire to raise the economic activities reserved for that sex to the level of those which are the men's privilege. As the exact sense of ʔutẽntere is "to kill by beating with a stick or club" (here, the digging stick), the informant tries unconsciously to identify [71] feminine collecting and gathering (which can only aim at the capture of small animals) with the masculine hunt, armed with bow and arrows. .

593 The relationships between brothers and sisters have not given rise to any particular observation. In the central and southern group, one finds a special expression to designate the brother of the same sex, nlaõre, "the other one"; this term is not only applied to kinship relationships, but also designates objects be-
[342] longing to the same type. Thus the five or six poles planted obliquely which fan out from the center, and which hold up the
● [534] first skeleton of the hut, are called indeleaore; likewise, the double (kalõde) or triple (lutondjone) pipes or whistles. Friendly
857 groups are said to be "brothers" (1) also, and in discussions

1. See p. 92.

between adversaries they use the exclamation:

17. kakõtjane takanãtjane (b1).

Wicked one! You are no longer my brother!

[92] which indicates that among the Nambikwara the term "brother" has the same wide sense which it possesses in our vocabulary.
857 But in the heart of the infantile society, numerous attitudes take
182 form which prepare or advance later relationships. The orphan baby a9 spends nearly the whole day in the hands of her young sister a8 (one is 2 to 3 years old, the other 6 to 7). Her sister takes care of her, carries her, feeds her. a19 and a20 (who are "mothers") act like elders toward these two children, in a way more marked than the real difference in age calls for. In fact, a8 and a20 are contemporaries. The eldest, a19,cracks bacaiuva

721 Excitement and enthusiasm decline, and the group returns home.
But some are pushed until realized, [95] and can be very murderous.
726 The Nambikwara usually attack at dawn and extend their ambush by
dispersing throughout the bush. The signal for attack is given from
[531 203] place to place, thanks to the whistle which the Indians carry hanging
from their necks. This little whistle, composed of two bamboo tubes
[136] tied with cotton thread reproduces the cry of the cricket approximately,
and doubtless for that reason has the same name (kalõde) as this insect.

MAGIC, RITES AND RELIGIOUS BELIEFS

278 Some beliefs of a magical and religious character also play
[177] their role in social life. The most important is the notion of
nande (bl). To analyze it, we should first say a few words con-
cerning poisons. The Nambikwara are very expert poisoners. They
make curare for their arrows, or at least for some of them, pre-
[415] served in little earthen pots. (1) Without enlarging here upon the

1. The study of the Nambikwara curare was made, on the occasion of our expedition, by our friend and companion Dr. J. A. Vellard. Cf. Vellard, "A preparação do curare pelos Nambikwaras," Revista do Archivo Municipal de São Paulo, LIX, 1939, p. 5-16; "Communication à l'Académie de Médicine de Paris," id. LVIII, 1931, p. 117-118.

manufacture of the curare, it must be noted that this preparation, although reserved for chiefs and sorcerers, is not surrounded by any ritual and does not give rise to any magical operation. The Indians make the curare publicly, applying recipes and taking precautions which are either essential to the effectiveness of the product or which constitute simple prejudices, but all of which have a positive character. Their attitude towards this poison thus may be considered as scientific. Along with curare, the Nambikwara know other poisons likewise of vegetable origin, and which take the form of powders
[415] contained in small tubes. These are made of quills, feathers, or stalks of bamboo or other wood, cleaned out and corked at both ends with a piece of vegetable pith or cotton, and at times decorated with red dots and lines made with urucu paste. (2) These tubes are

2. Cf. Rondonia. Roquette Pinto collected examples of these tubes and reproduced one of them (Rondonia,

796 The seasonal celebrations take place at the beginning and end of the rainy season, and probably mark the opening and closing of agricultural labor. They consist of festivals with dancing, singing and music. Several days in advance, hunting expeditions go in
[226] search of small game, and they also go in for large fishing expeditions. In fact, fish seems to play a role of the first rank in the ritualistic
796 activities. (1) Other Indians leave, sometimes for far-off places in
●534

1. See below, p. 109.

[524] order to find thick bamboo in the forests which border the rivers or which occupy the valleys, from which they cut pieces to make the flageolets for the ritual. These are about 70 centimeters long and pierced by four holes besides the one for blowing. An air passage is effected at the upper end in the mouthpiece of wax which closes the opening. They are only used upon occasion of these ceremonies and are played in unison in groups of three, one of them, engraved with a white longitudinal line, being named jomõte pilikãde, (chief flageolet), and played by the chief. A resonator made from a bamboo trunk furnished at the lower end with a hollowed-out gourd usually accompanies them (dikãndo, b1). The flageolets are called "male" and the resonators "female." Quite curiously, these flageolets are called jomõte (b1/2) and jamakĩ (c), by the central, northern and southern groups, that is from the same term (jamakĩ) by which the Paresi name the same instrument, while the eastern groups, who are the only immediate neighbors of the Paresi, employ a completely different term: kajgetãn (a 1/2). The Indians describe these festivals thus:

796 45. ãkõtrige ãdnige iwahãine ungãrage (hãdõne) ãnungerage
to hide to blow to play [the flageolet] to make merry fishing.

nahundage tãtige nigattahãtrige kãde kãde kãde kĩ ãitõndige
to carry to roast to make chicha moon moon moon this moon to dance

ãikõhãndige mihãdage komiãgerage
and another time to play [the following month] more rain everything is dry

[106] mĩãdage tuthahaikãtrige
the rain is finished let [the flutes?] be carried away

hãnõndige halehãdnige dend horãtige ejãtõnde
to make the field feast the women are hidden they do not see it

796

alãgena haɨtige (b1)
to sing in the place.

534 A very strict taboo rests on the flageolets. Only the adult
784 men can play them:

46. uɨtnore uɨtnɨa imaɨgare.
Children do not know how to play the flageolet.

And the sight of the instruments is rigorously forbidden the women:

denaɨtɨe iatiaeninɨnena ednapo iɨneni (b1)
the women cannot see them, only the men see.

These flageolets are made in great secrecy, in the same place where they find suitable bamboo. If the musical expedition returns by day, they hide the flageolets in the branches of a tree not far from the camp or from the village. They only bring them out at night, at the moment of the concert, and the women must then retire to the huts or under the shelters, and hide their heads in
[68] their arms. If one of them violates the taboo, they claim she would be pursued by all the men and killed by blows of a stick. We did not have the chance to attend one of these festivals, but, as we desired to collect the musical repertory of the flageolets, we were able, with a certain amount of difficulty, to arrange it so that a mission was sent to find bamboo and make instruments for us (it was necessary to go about 15 kilometers). Having left in the morning, the group returned in the middle of the night, and until daylight we made music some distance from the camp in order to avoid all feminine indis-
[534] cretion. As each instrument sounds a little different from the others, the playing produces an illusion of harmony which is added to the charm of the melody, in itself very real.

534 It is possible that all the musical instruments of the Nambikwara
784 are connected to activities of an economic-social character. Some testimonials, a decisive confirmation of which I was not able to obtain, present the nasal flutes (aɨtasu, a2) as meant to assure a rich harvest of the fruit piquy. The season of piquy, which grows in
[222] abundance in the plains, is actually an impatiently awaited period for the Indians. The fruit is admiringly weighed and said to have "lots of fat." Likewise the flutes of Pan (asinzu, a1; juauzere, b1) would be employed in the rites preceding hunting expeditions. In
[192] the case of nasal flutes, a double analogy has been pointed out by certain informants between their form and that [106] of the pit of the piquy, and between their name and the name of the piquy (ahaɨru, a 1/2). The latter analogy exists only in the eastern dialect

534 (arãtam-ahãtu), and the connection remains suspect, the Nambikwara
709 not disdaining puns. (1) The same thing goes for the flutes of Pan,
[173]
[522]

1. For example, A1 mocks me when I am in the process of smoking: Kũkedetu ũkedetu: a smoker is lazy.

sometimes called duꞌdũ (a1/2) duꞌdũde (b1) which would also be the name of the animal agouti (Dasyproctas aguti). It is no less true that
[533] several of the songs collected have been pointed out as songs of the hunt or of the harvest. A soldier of the Rondon Commission, prisoner of the Nambikwara for quite a long time, described to Roquette Pinto (2) a ceremony composed of dances and songs which had

2. Loc. cit., p. 234-235.

followed a tapir hunt. And a musical theme was pointed out to us spontaneously as the song of the tapir hunt.

FROM BIRTH TO DEATH

844 The Nambikwara woman gives birth (to be born: talĩttige, b1) in a crouching position and getting support on the ground by means of a vertical pole which she holds with both hands. During this time a companion pours cold water over the chest and stomach with a small gourd. The umbilical cord is cut close and cauterized with a live coal, then covered with a salve of warm ashes.

47. dõtu saikedutuꞌiredãtelutu alõtu uĩꞌinkedjutu inketu jakesũtutu ire ire iagekediutu (a1)
[When] the woman gives birth the placenta is buried in the bush; she is ill, she does not eat [for] a moon, a moon [and then] she eats again.

846 After the ceremony of burying the placenta, consequently, the woman would remain for two months under a taboo and condemned to relative abstinence. In reality, an exceptional situation is prolonged much longer, the period of abstinence observed by the husband and wife until the child is weaned, or at least until he ceases to be exclusively nourished by the mother's milk.

To describe the state of abstinence (inketu, "one is ill" [a1]; there is no special term), we can do no more than to transcribe our observations made from day to day relative to the family of fire 6 composed of A21, a22, and a23. a22 is clearly distinguished from her companions:

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

533 **Music and dance.**—Music is clearly tonal, with melodic structures easy to identify. The end of a melody is usually marked with several shrill sounds which are repeated after each coda. Music is both instrumental and choral and usually accompanies dances.

535 Dances are performed under the leadership of the chief. Men and women stamp rhythmically on the ground while turning in a circle. Usually, dancers close one nostril with the left hand to make their singing nasal. Only men perform war dances, forming one or more rows and stepping forward and backward in front of the leader. In the second phase of the dance, they attack a post, a symbolical enemy, with bows and arrows, and clubs. Most of the dances and songs are connected with hunting or seasonal ceremonies, but they may be used at any time for mere entertainment.

534 **Musical instruments.**—Flageolets have four holes and an air duct; three are usually played together, accompanied by a rhythm trumpet made of a piece of bamboo with a hollow calabash fixed to its bottom. Nose flutes (pl. 36, *top, right*) are made of two pieces of calabash glued together with wax and pierced with three holes. One hole is blown with one nostril while the *other nostril is closed with the thumb; the other* two holes vary the notes. Nose flutes are also played in unison. Double and treble whistles have the air duct cut in the middle of the pipe, so that they can be blown at either end. Panpipes (pl. 36, *bottom, left*) are of two kinds: the common type has five pipes; the other type consists of two or three reeds cut obliquely at the mouth-end. All pipes produce approximately the same note in the latter.

272 273 **Drinks and narcotics.**—Drinks are made with crushed manioc or maize mixed with water, or of palm fruits, especially *Mauritia* sp., *Acrocomia* sp., and *Orbignya distichas*. A slightly alcoholic beverage is prepared of wild pineapples mixed with water.

276 The *Nambicuara* are ardent smokers. They cultivate a tobacco with tiny leaves, which they dry between two pieces of wood, crush with their hands, and store in small calabashes. Cigarettes are rolled in special leaves and tied with grass.

MAGIC AND RELIGION

771 The *Nambicuara* believe in the existence of a diffuse power or substance which may occur in objects and in living beings. It is manifest mostly in poisons, some of which are real (see Weapons, p. 366), some purely magical. To the latter belongs the resin of the barrigudo tree (a Bombacaceae), which is kept in tubes like the true poisons. When thrown by a special technique at an enemy, it is believed to make him swell like the trunk of the tree and die.

776 There are also dangerous spirits of the bush and of water, which may appear in the shape of an animal, especially the jaguar, or in a

SP17 Nambicuara SP17

252 placed on a platform under which a fire is lighted. In this manner large quantities of *kinakénere* can be prepared in one day.

When a woman gets ready to bake a manioc cake she pushes the hot coals and burning wood to one side and pats down the hot bed of the fire with a flat piece of wood. She then breaks off pieces from a dried manioc loaf and crumbles them over the bed of the fire by rubbing them in her hands. When she has crumbled up enough dry manioc, she pats down the flour to form a round, flat cake about 10 inches in diameter and from 1 to 2 inches in thickness. She covers the cake first with hot ashes and then hot coals. After one-half hour she uncovers her oven to find a brown cake covered with ashes and cinders. This sour, dirty, gritty product in no way compares with the fine-textured, sweet *mingau* of the Camayurá, the meal for which is prepared by crushing the dry ball in a mortar, then sifted to remove the rough fibers, after which the flour is dampened and baked on a pottery baking plate. Sometimes the whole manioc loaf is placed in the fire, and as it bakes the Nambicuara begin to break off pieces from the outside. For ceremonial purposes they bake cakes about 2 feet in diameter.

241 Toward the end of the rains in April and May the Nambicuara return to their fields to enjoy the fresh garden products. The harvest is inaugurated with a harvest ceremony (*hailónaktúte*). [247 252] Fresh maize, peanuts, and sweetpotatoes are roasted, manioc cakes are prepared, and, if possible, manioc juice is boiled to make chicha. These garden products, along with meat, supply the food for the feast, which lasts for several days. [534] The sacred flutes (*watárika*) are played in the flute hut, the spirits of the ancestors are present, and food and drink are offered to them.

221 The subsistence activities of the Nambicuara are, thus, closely associated with the annual cycle of growth in which agriculture forms but a part. The dependence of the Nambicuara upon the wild products of the forest and plateau are much more complex than has been indicated. They supplied long lists of names of plants, insects, and animals for which no Portuguese names could be found. A full understanding of their economic dependence upon the environment would come only by someone following a band of Nambicuara throughout the year to observe the complete annual cycle of

[p. 926]

757 patient. The juice of a certain plant is put into the cavities of teeth to stop toothache. The juice of boiled roots and leaves are taken internally for stomach disorders. One day I observed a woman pressing her foot over her husband's forehead as he lay on the ground. The heel was placed over the eye and she exerted considerable pressure. She was doing this to cure her husband's headache. These nonmagical practices are known to everyone. Some herbal medicines, however, are known only to the shamans and are used under the directions of the *enézau*.

778 The sacred flutes (*wéinkle*) are associated with ●534 *ehkhádilhiu*, the culture hero, agriculture, and chieftainship. As these flutes are similar in appearance to the sacred flutes of the Paresí, among whom they have great significance, it is possible that the Nambicuara obtained them originally from the Paresí. The flutes are about 2 feet long with four holes at the lower end and are made from a jointless piece of bamboo. When the band settles down near their manioc fields they build a special hut for the flutes, but when they are wandering around, the flutes are hidden in the [784] woods. Women are not permitted to see the flutes, and if one should accidently see them her stomach would swell and she would become ill. But what appears more important is the fact that the flutes poison people who do not treat them well. Yet, as only the chief and the head shamans play them this would mean that the flutes are the symbols of authority representing the men in whom power is invested. The flutes, four of which should be in every band, do not represent a spirit but appear to be more like fetishes. Boiled manioc juice is poured into them and they are offered maize and broiled meat.

241 The *wéinkle* are played after the fields have been planted and again at harvest time. After planting, the men gather into the flute hut and play 775 the flutes and sing the *weiydasu*. The ghosts of 533 the dead participate and, along with the flutes, are offered food and drink. At harvest time another ceremony called *hailóuakhíduteu* is performed at night during which the flutes are played and special songs are sung. The following day the whole band participates in a dance. The ghosts also take part in this ceremony.

534 In addition to the *wéinkle* flutes, the Nambicuara have a smaller four-stop bamboo flute called

[p. 101 (B)]

534 *kudínzu*, the nose flute, *moittanzu*, and the five-tube panpipe, *dítu*. The nose flute which is about 4 inches in diameter is made by sticking two round pieces of gourd together with rosin. Three holes are made on one side, two holes providing finger stops, while air from one nostril is blown across the other. These flutes do not appear to have any ritual significance.

771 In reviewing the religious symbolism of the Nambicuara it appears that the following conclusions can be drawn. The *okkhéitliu* myth explains the origin of the Eastern Nambicuara and their rights to the territory which they now occupy. *Tauptá*, although not the cause of illness, explains why people die. *Tauptá* and *dihnínuu* also account for the existence of shooting stars and the presence of rain. *Ulurá* appears to represent the ever-present forces of destruction inherent in the physical environment. Within the framework of these ultimate forces the Nambicuara carry on their struggle for existence assisted by and opposed by the members of their own kind. The security of the band depends upon the close cooperation of the kinsmen acting under the guidance of the chief. The *wdiarhu* flutes provide a supernatural sanction for the powers of the chief and thus help in enforcing and maintaining band solidarity. The flutes, furthermore, are a symbol of the common ancestry of the Eastern Nambicuara in that they relate the bands to the culture hero. The ghosts of the ancestors (*aydnkudiu*), like the living members of the band, must be well-treated in order to avoid danger to children and the perpetuation of the band.

619 But actual day-to-day danger to the individual comes from the members of other bands. Disputes over women and quarrels arising from the exchange of goods, as we have seen, lead to bloodshed and death. In the ultimate analysis each [621] band defends itself as a sovereign unit by force. The danger arising from the constant tension and suspicion between the bands is symbolized by the *enánau* who bring illness, who create the storms which destroy the houses and fields, and who threaten the band with starvation by making hunting difficult. As direct attack by other bands is met with the physical forces of the band, so spiritual attack by the *enánau* of other bands is met by the assistance of one's own *enánau*. They help the shamans to draw out the evil objects

5:Roquette-Pinto E-4 (no date)1913 SP17 Nambicuara SP17

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sararé and Galéra, affluents of the Guaporé. In 1909, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoákoré and Ouihanieré to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guaycurú and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoákoré, and who, as now stated, are Nhambiquára. This name of Uáikoákoré is given by the Parecí of the sub-tribes Kazinití and Uaimaré of the rivers Arinos, Sacuriú-iná, Tahura-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Caloçal and Jauré. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of cocoanut. They wear armlets, bracelets, leg ornaments and bead collars made from the fruit of the mbocúba. They live by the chase, but also plant maize, yams, potatoes, mandioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-atsíri and the Amuéas of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kóbbé of the Parecí, made from pounded mandioc. The native áwa or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Oanini and wax, and is preserved in leaves of the Malé-malé palm. It melts at a very low temperature.

To fell trees a stone áxe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutúm feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 38 in length. To draw an arrow of 50cm. between the larger bow and its string of taoum a traction force of 60 kilos is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malé-malé and liana. The upper disk has three orifices.

301 [280] [One necklace not mentioned earlier] is made with the
[829] seeds of a Cyperacea (tanieikerê) which the Suya of the Xingu River also use. . . . .

[825 Oradaikruzê is a beautiful bracelet made with the tail rings of
237] the giant armadillo (Dasypus gigas). It looks like ivory. Other bracelets are made from the nuts of the babassu and pindova (Orbignya speciosa)
[824] palms.

[Fig. 65]

Bands for the upper arm are made of cotton and fastened similarly to those of the Paressi.

291 The jalaçu is a simple fiber cape, widely used, which fastens to the neck and hangs down the back. There is also a black feather cape in the collection.

301 [281] The stem of the unetizú (nose plume) is made of thin bamboo or the stalk of a tough grass (Andropogon).

. . . . The helmets of puma or jaguar hide are used in that region only by the Nambicuara and by the Cayabi of the Paratininga.

[Fig. 66]

285 Max Schmidt broadly classified Brazilian Indian plaiting into Palmblattflechterei (palm-leaf plaiting) and Doppelfadengeflechte (double-strand plaiting). But he also admitted the existence of a third type, where two elements running in different directions are crossed by a third. This type occurs frequently on the Xingu River . . . and is found in Nambicuara baskets (atiçú).

[282: page of figures]

[283] As plaiting material the Nambicuara use titara liana and sometimes bamboo.

[293] . . . . Nambicuara fans, made with bacaba leaves, . . . are of pentagonal shape . . . .

534 A kind of nose flute made of gourd discs (hait-teataçú) seems
[171] to have been borrowed from the Paressi.

[Fig. 67]

The double flutes were borrowed from the Tapajoz tribes (Mundurucu, Maue, etc.). [See fig. . . .(70, p.]

but smooth-edged axes, is more akin to the proto-Neolithic or transitional period. The present trend is to recognize in the New World Paleolithic industries . . . but no formal overlapping periods as in Europe. (R. L.)

A later footnote by Heloisa Alberto-Torres which is not reproduced here contains the following statement: ". . . an interesting ethnographic relationship is [established by the absolute identity of Australian and Nambicuara axes . . ." (Ed.)

At first observation, the Nambicuara might seem to be an old and backward branch of the Paressi tribe.

[308] What we know of the physical anthropology ethnography and linguistics of both groups, however, invalidates this supposition.

177 Yet their culture bears unmistakable signs of Paressi influence.
[342] The first is the beehive-shaped house, formerly built by the Paressi. This is an import among the Nambicuara; the original house of the Serra do Norte Indians is the screen of leaves and branches, similar to the kijême of the Botocudo (Windschirm of the German ethnologists) and reminiscent of the North American wigwam.

[Fig., p. 61A]

[309] And if they did not borrow the large "round house" from the Paressi, they adopted it from Bolivian Indians.

[310] Another instance of alien influence is the nose plume, which the Paressi do not wear now but which formerly, according to Antonio
177 Pires, they could not do without; and also the nose flute, which
534 [the Nambicuara] play unskilfully, as though it were a little-known instrument of yet unfathomed secrets.

The double flute seems to have been brought from the north. It must be an import from the Maue and Munducuru, with whom the Serra do Norte Indians have had serious clashes as already mentioned above.

SP17 Nambicuara SP17

533 **Music and dance.**—Music is clearly tonal, with melodic structures easy to identify. The end of a melody is usually marked with several shrill sounds which are repeated after each coda. Music is both instrumental and choral and usually accompanies dances.

535 Dances are performed under the leadership of the chief. Men and women stamp rhythmically on the ground while turning in a circle. Usually, dancers close one nostril with the left hand to make their singing nasal. Only men perform war dances, forming one or more rows and stepping forward and backward in front of the leader. In the second phase of the dance, they attack a post, a symbolical enemy, with bows and arrows, and clubs. Most of the dances and songs are connected with hunting or seasonal ceremonies, but they may be used at any time for mere entertainment.

534 **Musical instruments.**—Flageolets have four holes and an air duct; three are usually played together, accompanied by a rhythm trumpet made of a piece of bamboo with a hollow calabash fixed to its bottom. Nose flutes (pl. 36, *top, right*) are made of two pieces of calabash glued together with wax and pierced with three holes. One hole is blown with one nostril while the other nostril is closed with the thumb; the other two holes vary the notes. Nose flutes are also played in unison. Double and treble whistles have the air duct cut in the middle of the pipe, so that they can be blown at either end. Panpipes (pl. 36, *bottom, left*) are of two kinds: the common type has five pipes; the other type consists of two or three reeds cut obliquely at the mouth-end. All pipes produce approximately the same note in the latter.

272 273 **Drinks and narcotics.**—Drinks are made with crushed manioc or maize mixed with water, or of palm fruits, especially *Mauritia* sp., *Acrocomia* sp., and *Oenocarpus distichus*. A slightly alcoholic beverage is prepared of wild pineapples mixed with water.

276 The *Nambicuara* are ardent smokers. They cultivate a tobacco with tiny leaves, which they dry between two pieces of wood, crush with their hands, and store in small calabashes. Cigarettes are rolled in special leaves and tied with grass.

MAGIC AND RELIGION

771 The *Nambicuara* believe in the existence of a diffuse power or substance which may occur in objects and in living beings. It is manifest mostly in poisons, some of which are real (see Weapons, p. 366), some purely magical. To the latter belongs the rosin of the barrigudo tree (a Bombacaceae), which is kept in tubes like the true poisons. When thrown by a special technique at an enemy, it is believed to make him swell like the trunk of the tree and die.

776 There are also dangerous spirits of the bush and of water, which may appear in the shape of an animal, especially the jaguar, or in a

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

of skill and initiative are the prerequisites of a good leader. It is he who makes the arrow-poison, although the preparation of *curare* among the Nambikuara is a purely profane activity surrounded by no ceremonial taboos or magic prescriptions. It is he, also, who makes the rubber ball used in the head-ball games which are played occasionally. The chief must be a good singer and dancer, a merrymaker always ready to cheer up the band and to brighten the dullness of daily life. This could easily lead to shamanism; and, in some cases, I have met with chiefs who were at the same time healers and trance addicts. Mystical life, however, is kept in the background among the Nambikuara, and, wherever they exist, magical functions are only secondary attributes of the leader. More often chieftainship and sorcery are divided between two different individuals. In this respect, there is a strong difference between the Nambikuara and their northwestern neighbors the Tupi-Kawahib among whom the chief is, first of all, a shaman, usually a psychotic addicted to dreams, visions, trances and impersonations.

But although they are oriented in a more positive direction, the Nambikuara chief's skill and ingenuity are none the less amazing. He must have a perfect knowledge of the territories haunted by his and other groups, be familiar with the hunting grounds, the location of fruit-bearing trees and the time of their ripening, have some idea of the itineraries followed by other bands, whether hostile or friendly. Therefore, he must travel more, and more quickly, than his people, have a good memory, and sometimes gamble his prestige on hazardous contacts with foreign and dangerous people. He is constantly engaged in some task of reconnoitering and exploring, and seems to flutter around his band rather than lead it.

Except for one or two men without actual power, but eager to cooperate and to receive occasional rewards, the passivity of the band makes a strong contrast with its dynamic leader. It seems as if the band, having relinquished certain advantages to the chief, were in exchange relying entirely upon him for its interests and safety. I received a particularly striking demonstration of this under rather strange circumstances. After several weeks' discussion, I had obtained from a chief the favor of taking me, together with a few companions and some animals loaded with presents, to the semi-permanent dwellings of his band which were uninhabited at that time. This was a chance for me to penetrate more deeply into the unexplored Nambikuara territory

223 vanna, but they hunt for rhea eggs and the young birds.

224 When hunting caymans they do not use the word "cayman," nor will they take their eggs for fear of angering the mother cayman. After [535] a jaguar or tapir is killed the hunters sing and dance the following night.

Every group hunt has a hunt leader who is an experienced man. He tells each man exactly what he is to do. Hunting such animals as peccary, tapir, and jaguar demands careful teamwork. If the band splits up to hunt, the band chief will appoint the hunt leaders. If any man disobeys the hunt leader he will take the man's bow away from him and send him back to camp where he has to listen to the ridicule of the women. This is considered a great humiliation and happens only seldom and then to youths who are, as yet, inexperienced and overanxious to make a kill.

226 As the Nambicuara hunt along the banks of the rivers they are always ready to shoot any fish that happens to come near the bank. Sometimes they stand in one spot for hours waiting for pacú or matrinchã to pass near the bank. Certain berries which the fish like to eat are often thrown into the water to bring fish to the surface. At other times they tie a piece of broiled meat onto a stick and push the stick into the bottom. A man then stands on the bank, sucks air through his cupped hand, and as he lets the air out with a grunt he motions with his hand as if beckoning the fish to come near. This appears to be a magical act, for the Nambicuara claim that the fish understand the call. Sometimes they even talk to the fish saying that they have brought fat meat for them.

[824] Timbó fishing is practiced in the shallow cutoffs of the main streams. First the pond is dammed off, then bundles of timbó vine (*hôatz*) are thrown into the shallow water and beaten with sticks until the vines are crushed, the bundles are then doused in the deeper water. As the fish in the ponds are very small, they are scooped up with baskets, either the cylindrical burden baskets or a shallow square basket. They also use a conical trap made on the spot from a few sticks which they thrust into the weeds where the fish are hiding. When they have finished with this trap (*tsadru*) it is thrown away. Compared with the efficient equipment and methods in the Upper

10| The position of all groups known to be scattered through the Serra do Norte and Juruena Valley is recorded on the ethnographic map of the region which goes with these notes.[1]

[218] The exact meaning of the names cited above cannot yet be given with certainty. In the light of existing data, however, their study leads to the following conclusions which cannot be far from the truth.

Cocozu: "Uncles"; thus called by the others, perhaps, because they are the most primitive members of the whole tribe.

[578] Anunzu: This is clearly a corruption of the term anungú or amungçú, which means "woman's milk"--a disparaging epithet like so many others found throughout the Americas; it may mean "infants" (unweaned babies).

Uaintaçu: Apparently a corruption of umtaçú, which means "alligator" [Port. jacaré] in the language of the Juina Nambicuara. The Uaintaçu group would thus be none other than the old Jacare tribe mentioned in the first chapter of this work.

Tagnani: They are obviously the Tamarari of the old geographic maps; they should be equated with the Tamarare or Camarare, who gave the river its name and who are mentioned in several ancient documents.

Tawite: This word signifies "child" or "son" [offspring], a common appellation among other tribes as well.

In order to avoid future confusion, I propose to retain the name "Nambicuara" in conjunction with the specific name peculiar to each group.

341 The villages of the Serra do Norte Indians are usually built on the crest of small hills, far from the watercourses. Some are more than one kilometer distant from the nearest river or stream.

It may be assumed that the choice of such sites has a twofold aim: the Indians suffer less from mosquitoes and they dominate the surrounding territory, which is an advantage to people leading as they did up to now a life of constant warfare.

The village is built on a large plaza, fifty meters in diameter; once cleaned of bush, which is rooted up [219] by hand, the ground [538] is kept clear by the constant tread of feet. One night of dancing, with its endless beat along the same path, suffices to smooth out the village square.

1 [See map following foreign text, cat. 116 - Analysis]

113 Brasil [Materials for the Study of Brazilian Indian Psychology]." Arquivos Brasileiros de Psiquiatria, Neurologia e Medicina Legal (Rio de Janeiro, 1917).

237 301 Featherwork is scarce and in fact insignificant. One of the illustrations in this book [p. (608)] shows an interesting feather diadem patterned after an object of similar type but of admirable craftsmanship which the Indians purloined from their neighbors to the west and which is also to be found in the [National] Museum. (2) [Fig. 42]

2. Semicircular straw head ornaments are to be found mainly in the state of Amazonas as well as among the Huari of the Guaporé River, who resemble the Nambicuara in their primitive axes, their circular houses, etc. (Cf. Nordenskjöld, "The Ethnography of South America Seen from Mojos in Bolivia," [Engl.]).

The use of cotton has given an extraordinary boost to the development of featherwork among the Tupian Indians, as I demonstrated with the gorgeous ornaments made by the Urubu Indians (Gurupi River). The Nambicuara are familiar with cotton, but have not even developed featherwork based on plaiting or netting; this seems to attest to a tradition poor in such textile techniques. The Guayaki, who are Tupian Indians of rudimentary culture, according to Vellard, have neither featherwork nor agriculture. (R. L.)

535 We were able to observe two types of dances: a war dance which we recorded in a film shown at the National Library [of Rio de Janeiro] on March 15, 1913, and in which Indians of the Cocozu,

535 Anunze and Uintaçu tribes participated; and a festive dance in which we took part, executed in our honor at Três Buritis by the Tagnani and Tawite.

The war dance filmed in Campos Novos was later also [253] performed by the Tagnani in Três Buritis.

Armed with bows and arrows, the warriors form a line some 15 meters from a piece of wood which represents the enemy, singing in two-part time and marking the beat on the ground with their feet. [Fig. 25]

Two Indians leave the line, arrows ready and bows half strung, and walk as if cautiously hiding among shrubs in the bush. After a wide detour they come near the "enemy" and hurl their weapons at him.

This is the signal to attack; the singing ceases and a rain of arrows falls on the "unfortunate victim"....

41! 324 726 Then they advance upon him and give him a thorough drubbing with their bows or with sticks. Incidentally, this is always the function of the arrow--to immobilize the enemy or game and permit the attacker to come close and finish his work with blows. In the hunt or in combat, attack is always made from ambush. This is because the aim of the Indians at a distance [Fig. 27] is not as sure as generally supposed. The Nambicuara are not especially good archers. They certainly cannot draw the bow with their feet like the Bororo. Some can shoot well in height. They use no shield whatever either in the hunt or in war. After the attack they try to recover their projectiles. An arrow represents a certain amount of labor and must not be squandered...

They hold a number of arrows in their left hand and shoot them one after the other with incredible rapidity.

535 Men, women and girls participated in the festive dance.

A large circle was formed to the sound of an endless chant. The women stood on the men's left; pair after pair were joined until the circle was closed. [254] Each man placed his hand on the shoulder of the woman next to him. Within the circle, three girls of approximately the same age accompanied them in a close line, eyes lowered, hands crossed upon the chest. The girl in the center acted as a hub for this choreographic formation... [Fig. 43]

7:Roquette-Pinto--43A E-4, 5 (no date)1938 SP17 Nambicuara SP17
(ca. 1912)

535

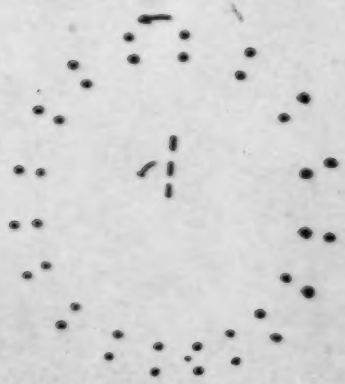

Fig. 43. (Astrolatrous?)
Tagnani dance (diagram).

535 The circling began at seven o'clock in the evening, with continuous chanting. The girls, not once deviating from their course, left regular marks on the dusty ground which were clearly visible in the moonlight. They seemed always to step in the footprints of the first round. Midnight. Near the fires lit by every family, the old people slept; some muttered and poked the embers which gleamed like scattered rubies. Within the circle, perspiring, covered with dust, more dead than alive, we all joined in the chorus: "Tagnanî-i! Tagnanî-i! Tangrê!"

Thus it went on all night. Whenever one of us fled and repaired to his hammock, two or three big husky fellows would come talking volubly, and drive the deserter back to his place...

[521] Unfortunately the words of those chants were not recorded. We only know the two words cited: tagnani, the name of the tribe, tangre, which means "star." Was this astrolatry? The three central figures of this dance, in the course of which stars were mentioned, brought to my mind [255] the beautiful constellation of Orion with its Três Marias ["Three Maries"--the Belt].

533 I recorded two Cocozu musical pieces which are rendered here [pp. 73-74]. Prof. Astolpho Tavares has transcribed them into musical notation.

[Fig. 34]

The scale [diapasão] of Nambicuara music is about half a tone lower than our normal scale.

The notes used in the recorded pieces are: do^1, mi^{2b}, fa^2, fa^2, sol^2, la^2. Neither re nor si appear.

The recorded pieces are in la flat major shifting to mi flat minor (Recording No. 1), and in mi minor (Recording No. 2).

The musical motifs develop in two-part time.

184 The Serra do Norte Indians present two distinct kinds of social organization. From this standpoint, the Tagnani and Tawite are more advanced than the Cocozu and Anunze.

593 [511] The latter live under a patriarchal regime: the father rules the family, which is often monogamous. The children, after puberty, start new families according to their own wishes [à vontade] and continue to revere their progenitors.

648 609 Also, the attitude of two bands who know that they are neighbors is very significant. They fear the clash of contact, and at the same time they desire it. In fact, they cannot meet one another accidentally, for for several weeks they watch the vertical smoke from the campfire which rises, perfectly discernable at some twenty kilometers, into the middle of the clear sky of the cold season. It is one of the most impressive spectacles of the Nambikwara territories when towards evening this smoke suddenly fills a horizon which one had thought deserted. Is the band which approaches friend or foe? They do not know, and they discuss at length their course of conduct. For days or weeks they avoid one another by maintaining a reasonable distance between the fires, then one day, according to whether the contact appears inevitable, desirable, or necessary, the women and children scatter in the bush and the men leave to face the unknown. We attended one of these "encounters" (nakohattige, bl). A long conversation is entered upon (dehihotige, bl) between the two bands reduced to their masculine elements, or more exactly, the leaders undertake, in turn, a sort of prolonged monologue, composed of exclamations, uttered one after another, in a tone at the same time plaintive and tearful, where the voice rises and trails off in nasal fashion at the end of each word. The group animated by warlike intentions exposes its grief. The peaceful protest their good intentions. It was not possible for us to reconstruct the word for word translation of this discourse. However, we give here the indian text, insofar as we have been [92] able to get it, and its approximate translation, for the purpose of showing the construction and specific tone:

[533] 38. One group begins: nisiroehdige? nindige. -"We are very irritated! you are our enemies!" And, after a series of exclamations of this type, the other replies: ki orage? tonaden? nuhaigi?n nikmaetie? nikmaini? nihenizenohi?n moladeringa?n nagatalinjot endige?. -- "We are not irritated! We are your brothers! We are friends! Your friends! True friends! We can understand one another." (bl)

After having exchanged these peaceful protestations, the groups reform and a common encampment is organized, each group preserving its individuality and gathering together its fires, and sometimes songs and dances are organized in the course of which each group disparages its own exhibition to the profit of that of the other group.

collectively obliged to make reprisals for an injury done one of its members. Much more often, given the very lively and permanent animosity which reigns between the groups, these pretexts good for exciting the spirit are voluntarily entertained, especially if they feel strong either because of the importance of the group's strength or because of an alliance with neighboring bands against a common enemy, concluded by the intermediary of messengers acting as ambassadors. The proposition of war is presented by an exalted individual or one who exposes before his companions his particular griefs, in the same tone and style that speeches were made at the encounter.

39. ẽ akinãẽ ẽednãẽ ɡõdegãẽ kakonɁẽ ordnɁẽ ɡalaɡɨẽnɁẽ (b1) whose approximate sense is: "Hello! Come here! Let's go! I am irritated! very irritated! arrows! big arrows!" The Indians become so excited upon the occasion of these epic speeches that it is not possible to obtain the commentary of the formula except well after they have been cited and undoubtedly very unfaithfully. But war is not a matter of purely profane decision. It necessitates a preliminary ceremony which will determine if the signs are favorable or not. Dressed in special attire, tufts of buriti straw dappled with red, hoods of jaguar skin, the men assemble under the leadership of the chief and execute the special dance and chant of war. (1) A divining rite

1. Dances and music will be the object of a special publication.

is then performed. The chief, or the sorcerer in the groups where he exists, goes solemnly to hide an arrow in a corner of the bush. The arrow is retrieved the next day. If it is covered with blood, the expedition is undertaken, if not, it is given up. (2) Many warlike

2. This symbolic use of an arrow seems typical of cultures situated north of the Amazon. The fact is interesting, given the northern affinities of the Nambikwara language. Concerning the use of the arrow as the message of war, cf. Roth, "An inquiry," etc., Annual report of the Bureau of American Ethnology, 30, p. 362; Koch-Grünberg, Zwei Jahre unter den Indianern, etc., Berlin, 1910, Vol. II, p. 316; Gumilla, Historia Natural del Rio Orinoco, Barcelona, 1791, Vol. I, p. 134.

expeditions thus begun end after several kilometers of marching.

fat pieces of meat is a constantly relished dream, even though rarely realized. On the other hand, the provisions haphazardly collected are considered—and really are—the daily misery. In Nambikwara folklore, the expression "to eat grasshoppers" (tagare urrige, bl), a typically feminine and infantile harvest, is nearly equivalent to the French "to eat the mad cow" (to rough it). At the same time the woman is considered a tender and good being, but of the second order. The language which she uses habitually separates her from the men and unites her with the children (in the same way that she collaborates with the children in expeditions of collecting and gleaning). We shall see later that this assimilation also continues into the metaphysical thinking and that, on this latter plan, discrimination between the sexes attains proportions whose psychological attitudes are only a derisive indication. It is considered well-bred for men to speak of women with a pitying good will, and, in conversations between the two sexes, to address them with a slightly mocking indulgence. Certain sayings are heard often among men speaking among themselves:

5. urtnoũnatukine ioõotnuũutnãdniani denesunatukine. (bl)
The children do not know, I know, the women do not know.

and they being up the group of women (dosu, al), their jokes, their conversations, with a tone of tenderness and mockery. But, of course, that is only [57] a social attitude. When the man finds himself alone with his wife around the camp fire, he listens to her complaints, considers her demands attentively, asks her help in a hundred undertakings. The male line of talk disappears, and gives way to the collaboration of two partners conscious of the essential value which they have for one another.

This ambiguity of male attitude as regards women has its exact correspondence in the equally ambivalent behavior of the female group. The women think of themselves collectively, and manifest it in several ways. In the first place they do not talk like the men. Even though a sexual language does not exist in the true sense of the word, in conversation a thousand inflections, shades of pronunciation are found which are typically feminine. Women articulate badly and affect a sort of jabbering which is reminiscent of infants' pronunciation. They whisper instead of talking out loud, and emit sout ih with an affected mannerism and preciosity which are at times seductive when they are not exasperating. Thus, in dialect al, they give words an ending -ũ instead of the usual -su or -tu. They also pronounce -kititu, the verbal suffix which is for men, -kedjutu or -kedjusu.

[734] wife. We have already cited the case of the two little girls
593 a8 and a9 whose stepmother (a7) refuses to take care of them.
Their father (A6) must, then, assume many of the lesser func-
[542] tions. At the time of departure for a trip, it is he who prepares
the basket for the elder, measures on her the length of the tump
line, and shortens it thanks to the free end which he fastens
passing it several times through the holes of the basket-work.
869 It is also the father who tells the children the traditional stories.
● 538 And, with a view to shortening and making more intelligible
these often long and repetitious accounts, he applies himself
to transposing them in a style especially adapted for children.
Thus, the infant's version of the story of the Flood (1) is as

1. See below, p. 120, the complete version of this story.

follows:

15. ɰãitento dohonenẽiram kãnaram hẽpatnẽ atãtene
ɰeidenkiathattene ɰafudɔnle. (b1)
Everyone was dead! There was no one left! Not a man!
Everyone was dead! Nothing more!

595 Relationships of a particular nature exist in the case of
571 polygamous marriage between the children of the first wife and
their young stepmothers. Even though the latter are called
"mother" or of "sister of the mother" by them, they live in a
state of companionship with them, especially with the girls,
which also extends to all the children of the group. We have
already dwelled on this society of girls and young wives who
take collective baths, go to defecate in a group, smoke to-
gether, joke and give themselves over to rather farfetched games,
such as spitting long jets of saliva in one another's face. An-
other example: a3 and a4 play with their stepdaughter a5. One
of them pushes her and throws her to the ground with such
violence that her head cracks against the ground and the little
one begins to shriek. The two young women heap mockeries
upon her. Finally, the youngest goes to drag her from the
ground almost by force and pushes her toward her mother, with-
out ceremony, like a package. These relationships are close,
appreciated, but without courtesy, like those which young boys
might have in our society. They rarely imply service or atten-
tion. Thus, A1 and his polygamous wives a3 and a4 divide a

In older versions, the old women (since the old women share the magic powers of the men among the Nambikwara as also in other tribes) (4) was undoubtedly not content with measuring the

4. Cf. above, p. 101.

fall of water by the duration of the fall of her nuts, she actually provoked it by throwing them. Whatever the case may be, "magical projection" is probably found at the origin of the theme of the throwing of small fruits or grains in South American folklore.

[122] PSYCHOLOGICAL ATTITUDES

The Nambikwara offer the observer a very special psychological and moral aspect, and one which we have not found again either among their immediate neighbors--Paresni, tribes of Guaporé, and Tupi of the Gi-Parana--or among other South American tribes. It is worth an attempt to separate its principal characteristics. Few of the primitive South Americans display so much spontaneity and freedom in their behavior. Few manifest such ease in psychological relationships, and such grace of expression. Thus, in their relationships with the ethnologist, the informants introduce formulae which constitute true sociological inventions in order to respond to a new situation, on the part of individuals who do not use either a formula of greeting or of leave-taking in their own social relationships:

60. tai undejwenjẽ ta eikiredenjẽ nã̃ jiren undenjẽ tatjene nã̃ kitjani. (b1)
I am going to sleep, I am going away, you go to sleep, I will stay, you go away.

Or to put an end to an interrogation of which they are weary:

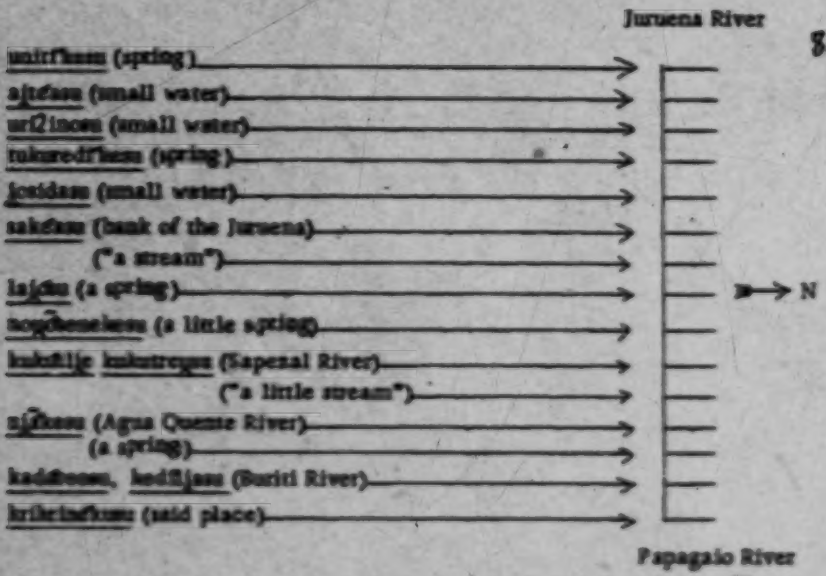
61. iejiana amenenjẽ hikwaripna iatjene amdenjẽ kanahitan jedenjẽ. (b1)
This is useless, it must be left; one does not see clearly any more, this is useless, let us leave it; tomorrow we will talk.

Or again:

62. nakanajẽnjani nihin nalitjani. (b1)
I have forgotten, wait till I remember.

Their daily life is full of exuberance. It is not only in the games of ball that one hears joyous exclamations:

1:Lévi-Strauss--137 E-5 (1938-1939)1948 SP17 Nambicuara SP17



TRADITION

The Nambikwara have a sharp sense of tradition. We have read [73
above (p. 50) a remark of 81 which shows him to be sadly cognizant of the decline of his race. Customs and techniques are generally considered as [[83
legacies of the "ancestors": 129]

58. iotiuou ikitage gʔtige.
"The ancestors taught us how to coil it [the ribbon of rubber meant for making a ball]" (b1).

One single legend was found relating to the origin of the universe. [120] 773
It is that of the Flood, the children' version of which we have already 539
given. (1) Here is the text used by adults:

1. See above, p. 69.

58. nartõue kẽʔõire
narukõtõire naukarẽʔõue
nahõtende kõnõ-rage naukõdo uʔẽre toãdige
the water had descended the water flooded everyone to die

773 dẽinhe nẽ̃kena kanayapẽ̃ndige

others distant (?)

773
539

nãgatatnãjãni ukuhajonetãtjena ukuajenthni
who do not know how to understand others who live so distant
[that it is necessary]
kanẽhgore kanẽhgore kanẽhgore
that a moon end that a moon end that a moon end
natiĩtnãjãni (b1)
in order that they arrive.

The whole story can be summed up as follows: alone of all the 773 humans, one old woman succeeded in escaping the Flood by hanging to the top of a buriti palm. By letting some nuts fall from the palm into the water, she was able to measure the decline of the water, and when the ground was dry, she came down and was delivered of a son. Through an incestuous union with her son, she then gave birth to twins of different sex, and from their incestuous union was born a new generation of twins. Thus, the whole of humanity would be descended from a series of marriages between twins, each giving birth to a new couple. As men multiplied, new villages were founded, always further away. So much so that today men live at such distances from one another that they do not speak the same language, do not understand one another, and must travel for whole months in order to visit.

This version offers several points in common with others collected in distant regions of South America. It is doubtless necessary to interpret the throwing of the palm nuts in the light of the "magical projection" 773 which has been studied above. (1) The throwing of small nuts certainly 171

1. Cf. p. 96.

possesses a magic significance. The same episode is found in several versions of the legend of the Flood, (2) and its magical value is formally attested

2. Cf. for example the Tupi version collected by Thevet, cited by Métraux, loc. cit., p. 45.

for the Sipaia by Nimuendaju. (3) In older versions, the old woman (since

3. To kill the sun by throwing upon it small nuts of the palm tree anaja, thus introducing night upon the earth ("Sagen der Tembe Indianer" Zeitschrift für Ethnologie, Vol. 47, 1915, p. 296).

157
182

While they speak of the latter with the excitement, and the almost exalted tone, of discovery. Let us listen to an informant (B1) describe the double cycle of the year:

First the sedentary life:

67. nedɔ:ntãtage kanaaday hãlodige nedɔntãkero, natiirikero 221 539 157 182
Tomorrow go hunting come back again
nakɨrikero dãkero wɔdãkero
cook again go to bed again sleep again
najɔgikero ajreldãkero ajɨɔnkero
day again go to the field again cultivate the field again
ajɔgɔnkero ãamkɨɔro nunãkero ninindãkero
cultivate again leave again eat again
nangikero danunkero tadrige tãɨ tãɨ tãɨ
another day cut wood cut cut cut
telunãkero [teldãdige] mbãti mbãti mbãti
finish again wait wait wait
sordãkero ãtɨnunãtage [ãtɨnãkero] ikɨnutjɛt
burn again the cold comes [still the cold] plants
denãkero nayãarãnunkero naanindãkero
to go again looking for some return again
idãkero kakɨgãdatge [kakɨgãde] hãkɨrage kãkero
plant much dig again
ikɨranukãdige ikɨnurãkero
in order to plant dig plants cut again
teldãdãnkero dɛjnerãnapãnkero agrhãkero
finish again live a long time again pull up the roots

hejalikɔro herhanĩnĩnkɔro nungenĩ'nkero
one passes the hut of other people traveling meets others
pelikãtunde ĩ'tãlĩ'ne (b1)
one is united with others here are the huts.

As is seen, the two forms of existence not are only very strikingly opposed from the economic and sociological point of view. They constitute two poles around which accumulate complex ensembles of emotions, sentiments and memories. With the same tenderness with which they 157 192 caress their wives, the men evoke the type of life defined by the temporary shelter and the eternal basket, where the most incongruous means of subsistence are sparingly scraped, gathered together, caught each day, where one lives cruelly exposed to wind, cold and rain, and which leaves no more lasting trace than the souls of the women, dispersed by the wind and storms, on whose activity it essentially reposes. And almost like the reign of need is opposed to that of liberty, they conceive in a completely different aspect the sedentary life (whose specific and ancient character is still borne witness to the original species which they cultivate), but upon which the unchangeable chain of agricultural operations confers the same character of perpetuity as the reincarnated masculine souls, the durable home of winter time, and the cultivable land which will begin to live and to produce "when the death of its preceding cultivator shall be forgotten." (1) We do not think it possible to draw conclusions, from a work

1. Cf. quotation, p. 112.

having to do exclusively with several sociological and psychological aspects of the life of the Nambikwara, relative to the place one should assign them in the ensemble of South-American cultures. However, the preceding information suffices to show under what form the problem is posed. We are in [139] the presence of a culture which shows linguistic affinities with the Tupi, and which approaches the Tupi from the double point of view of family organization and religious beliefs, at the same time recalling

60/ As concerns a male subject E 10:

1- 3.	a²ɛ²nosu		
2- 4.	asoŭnosu	rec. :	asuittu
13-14.	asuĭ'ttu	rec.:	asuellisu
5-17.	a²ɛ²kehosu	rec.:	a²ɛ²kiraru
6-18.	ahuĭ'nosu	rec.:	a²ɛ²kiʼtaru
[21] 7.	asŏ'nosu	rec.:	asinoeʼru
8.	a²ɛ²nosu	rec.:	asinoeʼru
9.	arĭ'ndesu or (t)oŭnosu	rec.:	akenaŭnosu or alohsu
11.	asiŏ'su	rec.:	oyeŭsaesu
12.	asŭ'kosu	rec.:	asŭkosu (if the subject chosen is e 9 woman, E12 will be oyeŭsaesu and e 11 aseŏ'tasu, rec.: aseŏ'tasu)
15.	arĭ'ndesu	rec.:	alohsu
16.	alohsu	rec.:	arĭ'ndesu

If one does not keep account of the reciprocal use of the terms, normally univocal, alohsu and arĭ'ndesu in the case of parallel cousins, this nomenclature only includes univocal terms, with the exception of two: asŭkosu and aseŏ'tasu, and each sex has at its disposition only one of these two reciprocal terms; in other words, a man has only brothers-in-law, while a woman has only sisters-in-law. It will be seen below that as concerns the first term (asŭkosu), it implies particular relations between the men who use it.

The extreme simplicity of the system of course leads to some difficulties of nomenclature when one desires to distinguish degrees of parentage confounded by the system. In the same way its extreme symmetry risks bringing about contradictions when "oblique" marriages bring transfers between generations. To the classificatory nomenclature analyzed above is superimposed—or added—a descriptive nomenclature, which permits, in case of difficulty, placing the individual in the generation with more precision, or according to the degree of kinship which he holds with respect to the subject. This descriptive [55] nomenclature is not currently used, and above all, it never intervenes in naming. But it is consulted each time there is some doubt, and in some cases more frequent usage can be pointed out.

The first difficulty might be produced concerning the distinction of the real husband or wife, compared to the theoretical husbands or wives, or of the true father or mother compared to the theoretical

[36] Eastern group, dialect a1: oakletosu (a1): galifere (b1): galiririte (c).

621 [161] This group, comprising 23 persons divided into six families, was found in the region of the Papagaio River (Utiarity) upon the occasion of one of its excursions in the nomad period. As we learned later, it was part of quite an important Indian community localized in several villages or camp sites in an unexplored zone of the right bank of the Juruena River, where we went, traveled and lived with them. The dry season and the period of nomadism does not seem to have been the only reason for the isolation of the group; some differences re- [22] lating to command had seemingly provoked a break, grouping a certain number of individuals around an active and ambitious chief. We have, undoubtedly, been called on to play a semi-conscious role in this fight. We shall return to this point when we treat of command. However, the encounters of the group with other bands belonging to the same community have always been cordial. The meeting with a first band approximately restored the population of the winter vil- [61] lage; and the strength of a neighboring village, found later on, increased the number to 75 persons, the largest number of Indians that we saw united in eight months.

As will be seen by the genealogical chart opposite, the restricted group is composed of four generations, the oldest reduced to two individuals, the following being composed of "husbands" and "wives," "brothers," "sisters," "brothers-in-law" and "sisters-in-law." The third and the fourth, finally, constitute a complex mixture of children, sometimes at an early age, considered as "children" or "relatives," and of adults classed as "brothers," "sisters," "husbands," and "wives," and shifted to a generation younger than their normal one because of their situation as children of older brothers.

Before giving several quick pieces of information about each of the members of the group from the point of view of his situation in the kinship system and of his individual psychology, it is necessary to stop for a moment at the question of proper names.

• • • •

• 551 Proper names are never pronounced among the Nambikwara. A very strict prohibition forbids them and raises a nearly insoluble problem for the notation of genealogies, even though the taboo does not seem to be as rigorous for the dead as for the living. Nevertheless, one [37] never hears a proper name, and individuals call one another

●551 either by simple exclamations:
bena (dialect a1): hetó (a2, b1, b2): "People!"; or by the kinship terms
1. sabéhi ó - wáinko (c): "Hey young one. --Father?"
2. tiditmeite mandétjena takenaãde kuikunjena uítige takenãe kuí'mkumenẽ (b1) (1): "The manioc is burnt; my brother

126

1. It is necessary to define more exactly the manner in which these texts, and those which follow, have been obtained. We have not had the aid of any interpreter. At the time of our stay there was only one, a Nambikwara Indian educated far from his own people by the Jesuit fathers, and whom unfortunately, we could not employ. The Indians in contact with the posts of the telegraph line use, in their relations with the Pareesi or Brazilian employees, a sort of "sabir", formed about forty words, one part Indian and the other Portuguese. This ingenious language, accompanied by numerous gestures, served as an introduction. At the end of about three months we had achieved a grossly empiric knowledge of Nambikwara itself, permitting us to make ourselves understood by the Indians, and more or less to follow a conversation. This result could not have been obtained without the tireless good will of the informants always ready to exchange words (Nambikwara for French or Portuguese) and to develop the obscure points by the use of an appropriate sign language. Working with these methods of chance we have both noted in passing fragments of conversation which were not addressed to us, and collected information by dictation. In both cases, the interpretation of the text was taken up again, afterwards, with the informants. It goes without saying that a meaning established in such a superficial way is not free from inaccuracies which sometimes may prove to be gross. We do not publish them for their literal meaning, often subject to caution, but rather because of the rough impression of indigenous life and atmosphere which they nevertheless aid to recreate. For the transcriptions, we are indebted to Mr. Paul L. Garvin for those which he established with the aid of our travel notes, and which he uses in his "Esquisse du système phonologique du Nambikwara-Tarundé," which appears in the Journal de la Société des Américanistes de Paris, 1948.

● 551 scrapes it to eat it. Brother! Scrape!"

551 177 The Indians feel very strongly the inconvenience of the system, especially when they are in contact with the whites. Those among them who intermittently frequent the posts of the Rondon Line have very rapidly adopted the Brazilian names which they hear pronounced around them, and they are—or have been—baptized Julio, José Maria, Luiza, Iracema, etc., giving these surnames some strange distortions. Sometimes too, there are nicknames like Lebre (lièvre = rabbit), Assucar (sucre = sugar) or Cavaignac (the shape of beard worn by the famous general). Several Indians have preserved this last name, thus perpetuating in the backwoods the memory of the time when Rondon lived and flourished.

We could use these names to designate them in the course of this study, or also their real names insofar as we have been able, in certain cases, to restore them. But these Brazilian names are only carried by the small minority of Indians who are in contact with the posts of the Rondon Line; [38] and the authentic names are lacking to us in a great number of cases. At any rate, the process would not be true to reality. For the remarkable point is that, in daily life, one does not hear a single name pronounced. It thus seems to us more in 128 conformance with the indigenous atmosphere to refrain, in the course 551 of this work, from using names to designate individuals, and we shall content ourselves with symbols indicating the sex, the group, and the place in the group of the individual considered (for each group, respectively A, B, C; capital letter for a man, small letter for a woman, followed by a figure identifying the subject.)

551 Nevertheless, as has just been indicated, it has been possible for 124 us, for group a1, to collect a complete list of names. This is how: one day when we were playing with a group of children, one of the little girls was struck by a playmate. She came immediately to take refuge near us, and began, in a very mysterious manner, to murmur something in our ears which we did not understand, and which we were obliged to have repeated for us several times, so that the adversary realized the trick, and, apparently furious, came in turn to reveal what appeared to be a solemn secret. After several hesitations and questions, the interpretation of the incident left no doubt. The first little girl had come, out of revenge, to give us the name of her enemy, and when the latter saw this, she told us the name of the other one, as a means of reprisal. From this moment on, it was very easy, if not very scrupulous, to arouse the children against one another, and to obtain from each of them the name of all the others. After this, a little complicity thus having been created, they gave us the

●55 names of the adults without too much difficulty. When the latter 124 found out our secret meetings, the children were harshly reprimanded, and the source of our information cut off. However, during a moment of great confidence one day, A1 gave us the names of her parents and great-grandparents, so that at the end of the account the list of proper names covers a total of five generations:

551 601
1. Mother of the mother of A1, ... Arigɨtiadusu.
2. Father of the father of A1 ..... Itɨtilisu, Irɨgudusu.
3. Mother of the father of A1 ..... Etuaɨgluglusu.
4. Father of the mother of A1 ..... Igigɨkulusu.
5. Father of A1 ..... Arakɨtiadusu.
6. Mother of A1 ..... Tuuufusu.
7. A1 ..... (missing)
8. a2 ..... Gɨɨndereru.
9. a3 ..... Uɨɨterekaneru.
10. a4 ..... Uaɨrakaneru.
11. Mother of a4 ..... Uaɨrasu.
12. Father of a4 ..... Ninuanɨ'usu.
13. a5 ..... Gɨɨnderɨkineru.
[38] 14. A6 ..... Tajɨrɨ'u.
15. a7 ..... Narɨɨ'u, Nɨɨnɨrɨkinere.
16. a8 ..... Tajɨrɨ'kineru.
17. a9 ..... Tajɨrɨ'kineru.
18. A10 ..... Nɨ'kloerekinɨdetu.
19. a11 ..... Selɨ?itirokɨsu.
20. a12 ..... Selɨ?itikineru.
21. A13 ..... Tarɨɨkakaresu.
22. a14 ..... Njɨɨelese.
23. A15 ..... Nikɨkitasu.
24. A16 ..... Njoselɨɨekiraru.
25. A17 ..... Kajɨkaresu.
26. a18 ..... Sonaɨkakaresu.
27. a19 ..... Sonaɨkakaneru.
28. a20 ..... Sonaɨkakarɨkiritasu.
Kjatorɨkineru.
29. A21 ..... Karɨɨtɨeju.
30. a22 ..... Itatɨnjɨdetu,
Idonerɨkineru.
31. a23 ..... Kjɨdikitasu,
Kjɨtɨtɨdesukineru.
Karɨɨkineru.

●551 As seen by the list, two categories of names exist. The adults possess a name of their own. The children are named after their parents—son, or daughter, of so and so. The name used in this case is usually that of the mother (a5/a12 (but who is not a child), A16/a19/a20): but not always: a8 and a9, whose mother is dead, are both called after their father, daughters of Tairiisu. As concerns a23, who is a little baby, a wide divergence manifests itself among our informants (it must not be forgotten that they are children, and that their information is uncertain), and the name of Karlokineru, daughter of Karlokeru, her father, has been taken even though her mother is living. But, as will be seen farther on, during our stay A21, a22, and a23 are confused in the same borderline way. On the other hand, the fact that the names of Kiatorekineru and of Idonerekineru could be chosen for a20 and a22 suggests that they are not the daughters of a18, but parallel cousins of her daughters. If such is not the case, the two names may be part of a collection, or have been attributed wrongly to their supposed holders.

[553 88] Adolescents receive their names from the chief at the moment of puberty. The name giving is a point to which we shall return later on. The fact that certain adults are designated on our list by a technical term is undoubtedly explained by the fact that our informants did not know their true names. Nevertheless, it must be noticed that, in the two cases being discussed, a12 is a pregnant woman and a22 a woman who is nursing a child. Both are submitted to complex prohibitions. A special prohibition rests perhaps on the name of individuals placed in certain situations.

[40] Whatever the case may be, these are the only names which we have been able to obtain and, regarding the prohibition which covers them, in the course of this report, we will not use them more than they are used in the daily life of the Nambikwara Indians. We shall now give some information concerning the individuals composing the group studied.

857 b5, who insists that the treatment that one gives the small ani-
609 mal to divest it of its hair be applied to the ethnologist:

21. nãingenãghẽẽ nãnẽẽgueudne (b1)

Put his beard in the fire! Roast his beard!

857 In general, they are to be good companions, enthusiastic, and
157 untiringly avid for games that are shown them. In exchange, they are very obliging informants once they have become friends. Al-
● [56] most all the information which we were able to gather concerning proper names comes from them.[1]

231 This chapter cannot be ended without presenting some observations relating to domestic animals. Not only do the children actually live in very intimate relationships with the animals, but the latter are treated in the family like real children at least outwardly. We mean that they share the group's food, benefit from the same manifestations of tenderness or interest—delousing, games, conversation, caresses—as the human beings. In everything, their treatment is [73] curiously the same. The Nambikwara have numerous domestic animals, first of all dogs, and cocks and hens; who are all descendants of those introduced in their region by the Rondon Commission; monkeys, parakeets, birds of various kinds, and finally, the caetetu, the coati (Nasua sp.), the jaguatirica. Only the dog seems to have acquired an
[229] occasionally utilitarian role in the service of women, for hunting with the digging stick (cf. quotation No. 16). The men never use them for hunting with bow and arrow. The other ani-
231 mals are raised for the purpose of pleasure. They are not eaten,
262 the people do not consume the eggs of the hens who lay them in the bush. But they do not hesitate to devour a young bird if it dies after a vain attempt at acclimatization.

The terms used for behavior regarding animals are the same as those used for humans. They say dehéna uʃtte uʃkarage, "the woman caresses the baby," or uʃinuette uʃkarage, "the woman caresses the puppy."

231 While traveling, except for the animals capable of walking,
482 the whole menagerie is packed with the other baggage. The monkeys, attached to the women's hair, adorn them with an amusing living helmet, elongated by the long tail curled around the neck of the bearer. The parakeets and hens perch on top of the baskets, other animals are held in the arms. None of them receive abundant nourishment but, even in days of need, they
231 521 have their share, however little it may be. As compensation, they are an endless subject of distraction for the group, the

[1] [i.e. From the children.--Analyst]

874 is buried in the camp. The child is bathed, and
[304] tiny washers made of tucum nut hull are placed
on its ear lobes. The washer or ring is cut on
an angle so that the two points eventually press
through the lobe creating a hole. As the child
grows, new washers are added. After a few weeks
● [551] the child is given a beaded necklace, but it is not
named, being known only as the child of so-and-so
until puberty, when it receives a name. The
Wakitinin appear to have no avoidances following
the birth of a child, although the Kitaxrbu are
[845] said to practice a modified form of couvade.
Twins are accepted with satisfaction. Illegitimate
[848] children are likewise accepted and are cared for
by the girl's parents until she marries. No stigma
appears to be attached to an unmarried mother;
however, this attitude may be a recent develop-
[845] ment. Crippled or malformed babies are not
[847] killed, but usually die shortly after birth.

Children are nursed until they are 2 or 3 years
853 old or until another child is born. Women in the
band assist one another in nursing and taking
care of the infants. If a woman should have two
small infants, another woman who has lost her
854 child will nurse one of them. Small children are
carried on the hip of the mother, sitting on a
strap which passes over the opposite shoulder of
the mother. This strap which is made from
embira bark or woven cotton is about 4 inches in
width. Women evidently are accustomed to
carrying heavy loads, for on many occasions the
tiny women were observed carrying not only their
child but also a huge burden basket full of fire-
wood. When the child gets a few teeth it begins
to chew on a piece of broiled meat. One morning
while Kaoro and I were debating what to do with
a rat which we had caught in a box trap the
night before, neither of us having the courage to
put our hand in the box, one of the missionaries
suggested we give it to the Nambicuara. Kaoro
then carried the box over to Julio's camp and gave
853 it to one of his wives. Without any hesitation
the woman put her hand in the box, pulled out
252 the rat, banged its head on the box, and threw it
on the coals of her fire. After the hair had been
partially singed off she pulled it out, cut off its
tail with her thumb nail, and gave it to her
cowife's baby, who began sucking on it as if it
had been a piece of candy. Then with her thumb

551 As seen by the list, two categories of names exist. The adults possess a name of their own. The children are named after their parents—son, or daughter, of so and so. The name used in this case is usually that of the mother (a5/a12 (but who is not a child), A16/a19/a20); but not always: a8 and a9, whose mother is dead, are both called after their father, daughters of Tairiñu. As concerns a23, who is a little baby, a wide divergence manifests itself among our informants (it must not be forgotten that they are children, and that their information is uncertain), and the name of Kariñkineru, daughter of Kariñeju, her father, has been taken even though her mother is living. But, as will be seen farther on, during our stay A21, a22, and a23 are confused in the same borderline way. On the other hand, the fact that the names of Kjatorekineru and of Idonerekineru could be chosen for a20 and a22 suggests that they are not the daughters of a18, but parallel cousins of her daughters. If such is not the case, the two names may be part of a collection, or have been attributed wrongly to their supposed holders.

[553 88] Adolescents receive their names from the chief at the moment of puberty. The name giving is a point to which we shall return later on. The fact that certain adults are designated on our list by a technical term is undoubtedly explained by the fact that our informants did not know their true names. Nevertheless, it must be noticed that, in the two cases being discussed, a12 is a pregnant woman and a22 a woman who is nursing a child. Both are submitted to complex prohibitions. A special prohibition rests perhaps on the name of individuals placed in certain situations.

[40] Whatever the case may be, these are the only names which we have been able to obtain and, regarding the prohibition which covers them, in the course of this report, we will not use them more than they are used in the daily life of the Nambikwara Indians. We shall now give some information concerning the individuals composing the group studied.

854 From this time on, the life of the Nambikwara infant goes on as we have described, and without there being much differentiation according to sex. These differences begin to appear only at the ap-
881 proach of puberty. At this time, the girls adopt a completely new behavior. They allow themselves great liberties, speaking brutally to their entourage and [109] amusing themselves with obscene acts. The fact is that the ceremony of puberty, which coincides with mar-
[553] riage, marks a decided change in her life and it is also upon that occasion that she receives her name. The Nambikwara women marry
582 very soon after their first menstruation. The polygamy of the chiefs
[579] creates a permanent deficit of women, and the newly available wife is impatiently awaited. According to our informants, it is the young
584 girl who indicates to her parents which of her potential husbands she wishes to marry. She says that she "wishes to marry quickly" (ikiⁿdurige, bl); the term of dialect a1 for "to marry" being oçenaikitiu, literally: "to make a husband," it seems that, as has been affirmed, the initiative belongs to the girl:

48. inka (ni) duredaiẽn — durenje (bl)
"I wish to marry quickly" [says the girl]. "Marry," says the mother] (?)

Actually, it seems that the marriage is decided from infancy by an agreement between the parents. Farseeing parents must prepare far in advance the marriage of their son, for otherwise the latter risks not finding an available woman. Brothers-in-law have often indicated to us that their children were promised to one another.

881 At the time of puberty, the young girl is completely isolated for a period of from two to four months. She lives in a specially constructed shelter some distance from the village, and lives there alone, observing a series of alimentary and social taboos. During this period, her mother feeds her and takes care of her. The period of segration ended, songs and dances take place. Her shelter is torn down and "the mother takes back her child." Then the ceremony proper of marriage takes place. It is prepared by hunting and fishing, expeditions and is carried out amidst chants and dances:

49. ʃirige aiũingnerage denano inĵira ʃikira ʃiknira tããta halonoo tatiʃkta ʃindage hntimbãta uʃrige imãgãra imãgãra (bl)
Go get fish, the women arrive, arrive, to broil [the fish] in the square go out, sing, whistle, play the flute, play the flute.

585 The union of the husband and wife is pronounced by the chief who places in the mouth of each a large piece of fish. (1)

531

1. It has already been suggested (Kunike, "Der Fisch als Fruchtbarkeitssymbol bei den Waldindianern Südamerikas, Anthropos, VII 1912, p. 206-228) that the fish could be a sexual symbol among the South American Indians. Tastevin has vigorously criticized this hypothesis (Le poisson symbole de Fécondité ou de Fertilité chez les Indiens de l'Amérique du Sud, Id., IX 1914, p. 405-417). However, the Nambikwara ritual of marriage seems to confirm the first theory. Moreover, fish is directly treated as the symbol of sexual relations in the legend where Maire-Pochy makes a girl pregnant by [110] making her eat the fish which he himself had fished. As the origin of this Tupi story is certainly Andean (Kunike, loc. cit.; Métraux, p. 12-13; Ehrenreich, Ueber die Verbreitung und Wanderung der Mythen bei den Naturvölkern Südamerikas, Congrès International des Américanistes, Stuttgart, 1904, p. 663) we have there a supplementary piece of information concerning the affinity of the Nambikwara with the cultures of the North and West.

881 [110] There is no puberty ceremony for the boys. This is replaced by a ritual of initiation which takes place toward the ninth or tenth year, apparently. It is composed of two essential operations, the giving of a name, and the piercing of the lip and of the nasal [55] 304 septum to place some wood ornaments there. The first operation is done directly by the chief, the second by a companion whom he designates to this effect:

50. getnoãdige iochãdige ullikade uelikãdellkinere nukenore jadotige jurojenje nikama jurojotige (b1)
When the boy is grown the chief, the chief gives him a name. A companion pierces his lip to put in the ornament. He [the chief] orders the hole [for the ornament] to be made.

• • • • •

853 nail she opened the rat and threw the viscera and
252 the rat on the coals. Within 15 minutes that rat was eaten, entrails and all, while Kairo and I looked on in a state of horrified fascination.
[842] Children thus begin by eating broiled meat and fish; pieces of sour, gritty manioc cake are given to them at a more advanced age.

PUBERTY

811 When a boy reaches the age of 14 or 15 he has
[304] his upper lip and the septum of his nose pierced with a sharpened fibula of a monkey ("macaco-prego"). One man holds the boy's arms, another his head, while an older male relative performs the piercing. Small plugs of bamboo are then placed in the holes. The following night the shaman leads the band in singing and dancing. Food is prepared in large quantities and offerings are made to the ghosts who are believed to be present at the ceremony. The boy is now given a name [553] which he will keep throughout his life. If the boy's father is dead he will use his father's name. If the father is alive he will use the name of some dead member in his grandfather's generation. In this way names are passed from one generation to another. An important part of the boy's puberty ceremony is the ritual beating administered by the old men of the band. He is now permitted to take part in the singing and can be present when the sacred flutes are played in the flute hut. Although this creates an attitude of obedience to the older men, he still continues to be abusive toward the women of the band. His unmarried female cross cousins now begin to notice him and openly show their desire to go hunting with him.

The puberty ceremony for girls is much more elaborate. After a girl has her first menses her father builds a small hut in the center of the camp, in which the girl is secluded. She must remain in this hut day and night and is attended by her female relatives. The chief then calls all members [202] of the band together, even sending messengers to distant hunting parties. When the band is united the chief organizes a hunt in which all the men take part, and they must remain away from the camp until the moon is full. While on the hunt [251] they accumulate a great quantity of smoked meat. When the moon is full, the men send a messenger to the camp to whom the women give some of the

Abstract.

Little has hitherto been known of the Nhambiquára who inhabit the valley of the Juruena and are spread thence to the rivers Sarauá and Galera, affluents of the Guaporé. In 1908, an official Brazilian explorer, Colonel Rondon, during his journey in the interior of Matto Grosso, was able to enter into friendly relations with them, collecting ethnological objects, and gathering information of their life, geographical distribution and customs, with those also of the Parecí.

The Parecí give the names Uáikoikuré and Quihaxiaré to the Nhambiquára, thus dividing them into two groups. Individuals of the latter group have darker skins and are more warlike. Colonel Rondon appears to have cleared up the meaning of the name Kabixí, which has been a cause of confusion, as often happens with collective names like Bugre, Tapuya, Guayanaz and others. The dwellers in Villa Bella (Matto Grosso) were accustomed to call Kabixí those Indians whom the Parecí called Uáikoikuré, and who, as now stated, are Nhambiquára. This name of Uáikoikuré is given by the Parecí of the sub-tribes Kazinití and Uainaré of the rivers Arinos, Sacuriú-iná, Tabóra-iná and Timalatiá to their kindred of the Kozárini group who inhabit the upper parts of the Rio Verde, the Juba, Cabaçal and Jauru. The term Kabixí is derogatory, implying an inferior condition.

The Nhambiquára are usually of medium height; they have large teeth, the abdomen rather prominent, muscular thighs, slender legs and well made feet. They perforate the nostrils, the nasal septum and the ear-lobes. Through the holes made in the nose they pass small pieces of wood, and from the ear lobes they hang ornaments made of small beads of ceament. They wear armlets, bracelets, leg ornaments and head collars made from the fruit of the mbambiba. They live by the chase, but also plant maize, yams, potatoes, mandioc, and beans. They smoke leaves similar to Brazilian tobacco and do not use hammocks but sleep on the ground, like the Campa-otaíri and the Amuéas of the Gran Pajonal.

In the collection made by Colonel Rondon for the National Museum at Rio de Janeiro there is an alimentary paste similar to the Kásábé of the Parecí, made from pounded mandioc. The native lyeu or bitumen is used with string to fasten arrow points to their shafts. It appears to be a mixture of Ouaini and wax, and is preserved in leaves of the Malí-malí palm. It melts at a very low temperature.

To fell trees a stone axe, fixed in a wooden handle by means of cord and bitumen, is used. The Indian who succeeds in felling certain trees with this primitive instrument receives as reward an arara or mutúm feather for a nose-ornament. Such a decoration is usually reserved for warlike prowess among the natives of Brazil. The bows are large, strong, of red wood and well-polished, with semi-cylindrical transversal section. Those in the Rondon collection vary from 1m. 80 to 2m. 35 in length. To draw an arrow of 50cm. between the larger bow and its string of tucum a traction force of 60 kilos. is necessary, as verified by the dynamometer. There are five types of arrows. They have two musical instruments, one, a double flute made of two pieces of bamboo tied together, the other, two concave disks of calabash, about 8 cm. in diameter, united at the edges by a strip of Malí-malí and bren. The upper disk has three orifices.

?Roquette-Pinto--34 E-4,5 (no date) 1938 SP17 Nambicuara SP17
(ca. 1912)

304 Only the men have pierced upper lips and nasal septa; the women, never.

Children still at the breast did not have their lip or septum perforated; but those whose first milk molars had appeared already had both areas pierced. Hence I believe that this operation is not performed until boys have reached the age of two.

301 Not until they are five or seven do they begin to insert through the lip and nose perforations some thin and distinctive plugs nearly always made of reed stems.

Their use is widespread in the Serra do Norte; I have seldom seen Indian men without those plugs.

[Fig. 35]

The lip plug rests between the median upper incisors and protrudes aggressively upward; the septum plug is thicker and shorter. Both are cut to the appropriate size by means of fire.

[241] If the plugs fall out, the wearer immediately retrieves them and sets them back in the perforations; on those few occasions when [the Indians] removed them to show us how they were fastened, they promptly replaced them as if ashamed to be deprived of their ornaments.

As a rule they wear both simultaneously. Some Indians prefer to the modest nose plug another adorned with a macaw or curassow feather.

[304] Contrary to what used to be thought, these ornaments do not seem to constitute marks of distinction or signs of hierarchy.

We saw youths of eighteen adorned with such plumes; none of the Indians accorded them the least importance.

When they wear these feathers, they forego the lip plug.

Their predilection for black beads is remarkable; they make them from the shells of small palm nuts to form multi-looped necklaces, and when we offered them an assortment of glass beads they chose the black ones at first. Yet they ended up choosing all of them... They are insatiable.

Nevertheless, their ornaments are predominantly black in color. Black bracelets; rings made with black palm nuts which they used to wear as ear pendants and which they carry now on their fingers to

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

[621] tuations, and the ascent or decline of individuals and groups follow 622 each other in a rather surprising manner.

How will the chief be able to overcome these difficulties? The first instrumental force of his power lies in his generosity. Generosity —an all important feature of chieftainship among most primitive peoples, especially in America—plays an outstanding part even on those crude cultural levels where worldly goods are limited to the most primitive weapons and tools, coarse ornaments made of feathers, shells and bones, and raw materials, such as lumps of resin and wax, hanks of fiber and splinters of bamboo for arrow-making. There cannot be great economic distinctions between families each of which can pack [622] all of its belongings in the baskets carried along by the women during 556 the long travels of the dry season. But, although the chief does not seem to fare better, in this respect, than the others, he must always have at hand surpluses of food, tools, weapons, ornaments which, while being small indeed, acquire great value because of the scarcity which is the prevalent condition. When an individual, a family or the band itself needs or covets something, the chief is called upon to secure the desired article. Generosity is the quality, much speculated on, which is expected of a new chief. Generosity is the string constantly struck which makes the general consent to one's leadership sound clear or out of tune. There is little doubt that, in this respect, the chief's ability to give is exploited to the utmost. Band chiefs used to be my best informants, and, well aware of their difficult position, I liked to reward them liberally; but I seldom saw one of my many gifts remain in their hands for more than a few days. Each time I took leave of a band, after a few weeks or a few months, its members had time to become the happy hoarders of axes, knives, beads, and so on. As a rule, however, the chief was exactly as poor as at my first arrival. Everything he had received from me (and this was considerably more than the average) had already been squeezed out of him. This collective greediness not seldom drives the chief to an almost desperate position; then the refusal to give plays about the same part, in this primitive democracy, as the threat to resign followed by a vote of confidence in a modern parliament. When a chief reaches the point where he must say: "To give away is over! To be generous is over! Let another be generous in my place!", he must, indeed, be sure of his power and prestige, for his rule is undergoing its severest crisis.

Ingenuity is but the intellectual form of generosity. A great deal

593
182
462 The conversation becomes animated and laughter spreads. In the dark
prairie the camp fires burn. Around the fire, the only protection
against the cold which descends, behind the frail windbreak of palms
[342] and branches hastily planted in the ground on the side where wind or
[415] rain is expected; near the baskets filled with poor objects which con-
stitute their whole earthly treasure; lying on the ground which ex-
tends around, haunted only by other bands equally hostile and fear-
ful, the couples, embracing tightly, are truly seen as the support of
one another, the comfort, the only help against the daily difficulties
and the dreamy melancholy invades the Nambikwara soul from
time to time. The visitor who camps in the brush with the Indians
for the first time feels tenderness as well as anguish and pity before
the spectacle of this humanity so completely unprotected; crushed,
apparently against the soil of a hostile land by some implacable
cataclysm; naked, shivering around the hesitant fires. He circulates
tip-toe among the underbrush, in the dark, avoiding crushing in his
walk a hand, an arm, a trunk, whose warm reflections are seen by
the light of the fires. But this misery is animated by whispering
and laughter. [56] The couples clasp one another as in the nostalgia
of a lost union. Their caresses, at the same time tender and candid,
are not interrupted by the passage of the stranger. One senses in all
[57] of them an immense gentleness, a profound carelessness, a naive
and charming animal satisfaction, and, emanating from all that,
something like the most moving and credible expression of human
tenderness.

593 Thus it is not surprising that the attitude of the two sexes as con-
831 cerns one another is characterized by intense interest. This interest
462 is translated in certain cases by the vocabulary. In fact the Nambikwara
542 have only one word to express "pretty" and "young," and a single word to
[517] signify "ugly" and "old" (munjene, jelene, bl). Their esthetic
judgments are thus based essentially on human considerations, and
above all, sexual ones. But the interest which is manifested between
the sexes is of a complex nature. Men judge women in a mass, as
being a little different from themselves. Depending on the situation,
they consider them with desire, admiration, or tenderness. In itself
the confusion of terms pointed out above constitutes permanent
homage. But it must not be forgotten that the form of economic
adaptation realized by sexual division of labor a capital role attributes
to the women, since family life rests to a very large degree (probably
the greatest) on the collecting of the women, but it represents an
[58] inferior type of activity. The ideal life is conceived on the model
of agricultural production or hunting. To have plenty of manioc, and

fat pieces of meat is a constantly relished dream, even though rarely realized. On the other hand, the provisions haphazardly collected are considered—and really are—the daily misery. In Nambikwara folklore, the expression "to eat grasshoppers" (tʃigwe ũʔtige, bl), a typically feminine and infantile harvest, is nearly equivalent to the French "to eat the mad cow" (to rough it). At the same time the woman is considered a tender and good being, but of the second order. The language which she uses habitually separates her from the men and unites her with the children (in the same way that she collaborates with the children in expeditions of collecting and gleaning). We shall see later that this assimilation also continues into the metaphysical thinking and that, on this latter plan, discrimination between the sexes attains proportions whose psychological attitudes are only a derisive indication. It is considered well-bred for men to speak of women with a pitying good will, and, in conversations between the two sexes, to address them with a slightly mocking indulgence. Certain sayings are heard often among men speaking among themselves:

5. ũʔtnoʃunatuʃkhne joʔotnuʃutnãdnjani denejunatukhne. (bl)
The children do not know, I know, the women do not know.

and they bring up the group of women (dosu, al), their jokes, their conversations, with a tone of tenderness and mockery. But, of course, that is only [57] a social attitude. When the man finds himself alone with his wife around the camp fire, he listens to her complaints, considers her demands attentively, asks her help in a hundred undertakings. The male line of talk disappears, and gives way to the collaboration of two partners conscious of the essential value which they have for one another.

This ambiguity of male attitude as regards women has its exact correspondence in the equally ambivalent behavior of the female group. The women think of themselves collectively, and manifest it in several ways. In the first place they do not talk like the men. Even though a sexual language does not exist in the true sense of the word, in conversation a thousand inflections, shades of pronunciation are found which are typically feminine. Women articulate badly and affect a sort of jabbering which is reminiscent of infants' pronunciation. They whisper instead of talking out loud, and emit sounds with an affected mannerism and preciosity which are at times seductive when they are not exasperating. Thus, in dialect al, they give words an ending —ʃu instead of the usual —su or —tu. They also pronounce—kititu, the verbal suffix which is for men, —kedjutu or —kedjuzu.

It is certain that they are perfectly aware of this peculiarity. When one does not understand them and asks them to repeat, they exaggerate maliciously, and more each time, the style that is particular to them, and when one desists, discouraged, they laugh and exchange jokes. They have succeeded. This is especially true of young women who do not yet have children, and of young concubines. The mothers and older women stress these differences less, although one also finds them among this group upon occasion. Besides, the young women like the society of children and adolescents, play and joke constantly with them; and it is the women who take care of the animals in that very human way peculiar to certain South American Indians. All this contributes to creating a special atmosphere around the women, in the interior of the group, at the same time child-like, happy, affected and provocative, in which the men participate when they return from the hunt or the gardens.

But a completely different attitude is manifested among the women when they are to undertake some one of the forms of activity which are especially intrusted to them. They accomplish their tasks as artisans with ability and patience, in the solitary camp, arranged in a circle and with their backs to one another, and, during trips they valiantly carry the heavy basket which contains the provisions and riches of the whole family and the quiver of arrows, while the husband walks ahead with the bow and one or two arrows, the wooden spear or the digging implement, looking for the flight of an animal or a fruit tree. One sees these women then, the forehead bound with the tump line, the back completely covered by the wide basket in the form of an inverted bell, walking for kilometers with their characteristic step: [58] the thighs very tense, the knees together, the ankles turned out, the feet turned in; leaning on the outer edge of the foot and moving the hips, courageous, energetic and gay. We give on the opposite page a chart of the division of tasks between the sexes, but this division should be interpreted in a less strict manner than usual for phenomena of this type. Among the Nambikwara collaboration between husband and wife is carried so far that many tasks are done jointly. More exactly, if the man rarely intervenes in feminine tasks, the woman on the other hand (and above all the supplementary wives in case of polygamy) unceasingly aid their husband. We have indicated by crosses between parentheses the cases where a task attributed to one sex is occasionally practiced by the other. Thus, when they are alone or among themselves, the men do the carrying, but they do not carry from the forehead (senasikititu, al).

1: Levi-Strauss-112 E-5 (1938-1939)1948 SP17 Nambicuara SP17

789 of warm air, aided by small fragments of paper put over a fire, was at least accepted, is not understood. And as usual when it is a question of excusing an incident (which could have had very unhappy consequences), they put all the blame on the women, "who do not understand anything," "were afraid" and feared a thousand calamities. (1)

1, Later, Al asked for some balloons to give a demonstration himself before the combined groups assembled by him. But, less forgetful than he, we obstinately refused.

Two conclusions are gleaned from these facts. The first is [98] that the term of nãnde covers much more than the strict meaning of the word "poison," and that it includes all types of actions of exceptional and likewise menacing character, as well as the products or objects likely to determine this action. All nãnde objects and operations have a common character, expressed by the term kakore. This means the dangerous products or substances, and, at the same time, those of a menacing or dangerous nature which certain living beings may possess by specific or only temporary right. Thus poison, the snake, the poisonous spider, the jaguar, are kakore; but the same is true of an enemy tribe, or an Indian (even if he is a [98] relative or friend) when he projects revenge or is found in a state of violent anger. The second conclusion is that the poisons, whatever may be the positive and utilitarian character of their preparation, are not thought of scientifically as substances provoking physiological disorders, but as vehicles or receptacles of that mysterious force which turns the usual order of phenomena upside down. Nevertheless, nãnde is not conceived of in the abstract form of a power. It resides in, and cannot be separated from, certain apparently recognizable material aspects. When the Indians examined our balloons of silk paper, they sought something there which would be the concrete sign of their magical and malevolent nature; and while they proceeded with their inspection, we wondered anxiously what could be the specific characteristics (happily absent) of the product or the nãnde object. If it is true that the sense of the term nãnde is more complex than that of the word poison, it is no less necessary to recognize that poison carries the better example and the more perfect illustration of the Indian conception. It is a clearly identified substance, and recognizable by its outward characteristics to which its evil effects necessarily correspond.

§36 who seem to be susceptible to violent passions. We knew an Indian who fled with a Paresi Indian girl during our stay, and lived with her for several months hidden in the bush and fleeing the husband who was in hot pursuit after them. Here is the way an informant (B15) tells of a former adventure. He reconstructs a dialogue with the beloved woman:

51. ajadarinjẽ — otendinjẽ — ajdotẽha ãdakwajaini pumadajẽ ajhajtaxijẽndige tamimedinjẽ (b1)
Do you want to make love?--I do not wish to. --You are worth nothing! I want to make love or I will kill you! Let us go make love.

Very anxiously the woman responds:

higekanhẽ gairirẽ gairidedinjẽ etẽdahẽ dungrajeni (b1)
Do it quickly, my husband will be angry, he will beat me.

There is no social sanction against adultery; but the wronged husband can avenge himself in a fearful manner and in circumstances of this type poison, used either against the wife or against the lover, plays its role. In order to avoid such incidents, the companions intervene between the adversaries and counsel the seducer to disappear for a while:

52. ijehetnjẽ ajkwakatednjẽni ekudde ekudde ekudde ekudde ekudde ekudde ekudde ekudde ekudde kajẽdodni wajknoreniani (b1)
Go away. --I am going far away. --When this moon is ended and that one, and that one, and that one, and that one, and that one, and that one, then, in that one, you may return.

We knew an Indian (C11) whose wife disappeared one day, having left with a member of his group. He thought first of revenge, but his companions intervened, and it was finally decided that the lover should keep the wife and would give him a dog as compensation. Several months later, the lover died (we were not able to find out whether the death was normal or accidental), and the woman returned to her husband, who said he was very happy to have acquired the dog also. This story should not be interpreted in the sense of an equivalence, conceived by the Indian spirit, between a woman and a dog. We have insisted too much on the fundamental role of the woman in Nambikwara life to have to return to that here. But in groups where trade [112] exists in such a primitive form (1) exchanges of goods have as a

1. Cf. p. 93 f.

American Indians. As example of the first aspect we shall mention: the public and "scientific" preparation of the curare; the development of certain therapeutics such as the treatment of ophthalmia by instillation; the flexibility of the sexual division of labor; sexual life in general; the atmosphere of the rites of abstinence; the rational attitude as regards alimentary taboos. Several remarks on this point will make clear the indigenous psychology. The white worms (anathu, a1) which are frequently found in the nuts of the bacaiuva palm have been indicated as being inedible. Subsequently we verified that they were eaten in secret by the children. Thus a8 finds them while cracking nuts and gives them to her little sister a9; and furtively she too eats a worm. Her action is noticed by a3 and a4 who cover her with sarcasm. However one day when food is scarce, A1 eats a plate of worms which his young wife a4 has gathered for him, and sadly remarks that, due to lack of meat, he is reduced to this poor fare. The same observation is made about the hawk. Above we showed what constitutes the metaphysical basis of the alimentary taboo concerning the jaguar. However, the current interpretation is entirely different:

66. ujatedednẽ̃ yiliẽe (h1).

I don't eat any of it, it smells bad!

In the face of new situations, the Indians generally react without mysticism. Thus, A1 before the problem of writing: (1) on the other hand,

1. P. 40 f. and p. 89.

the Nambikwara show total indifference toward photography, even when they have understood its purpose. We have never found [126] Indians who tolerated the participation of the camera in the slightest details of their intimate life with such complete indifference.

However, the passage to irrational positions is made with the same brusqueness which characterizes the two attitudes, almost simultaneous, of an infant hilarity before the still unusual sight of an inflated balloon which burns, and of an appeal to evil magic when a second balloon succeeded in rising. (1) Never does the tender indulgence with which the men surround

1. P. 97.

their companions (2) allow one to suspect the actual metaphysical curse

2. P. 86 f.

with which the women are burdened in the Nambikwara culture, excluded under pain of death from collective ceremonies, deaf and blind to the voice

of the Beyond, and condemned to nothingness after death like non-initiated babies. We have described the tender companionship which presides in the relationships between the sexes, and the general harmony which reigns within the groups. But when these are altered, it is to give way to the most extreme solutions, poisoning and murder. It is quite reasonable for the informants to underline spontaneously the role of forgetfulness in funeral rites. (3)

3. P. 112.

For there is a striking contrast between the joyous irony with which one answers someone who is ignorant enough to inquire about a relative deceased for quite awhile: "ihitu, ilgetu" (a1), "to the sand! in the sand!," and the horrible apparition of the atatu which is evoked with ritual sobbing.

Nambikwara rites do not seem to be symbolic in any way. The skeleton-like state of A21 and a22 at the end of the period of abstinence testifies to that, and although ceremonies are rare, they are carried far. The informants speak of periods of three months for the isolation of the young girl entering puberty, and of a bath in the river lasting a whole night as a preliminary to marriage. However much behavior is supple and without complication in daily life, likewise intrusions of the supernatural (in visions and revelations, the séances of shamanism, war dances, etc.) are manifested by the transition to an atmosphere of tragedy. No South American group, to our knowledge, expresses in such a sincere and spontaneous way (for one never feels the theatrical atmosphere of Tupi or chaqueno shamanism) such violent and opposed sentiments, whose individual expression seems inseparable from a social stylization which never betrays them.

* * * * *

It is far from us to wish to assign an exclusively economic cause to this dualism. Nevertheless, it is astonishing to consider that the psychological dualism goes on an equal footing with the organization of social existence around [127] two opposite poles, on the one hand the sedentary life, agricultural, based on the dual masculine activity of the construction of huts and of gardening; on the other hand, the nomadic period, during which subsistence is principally assured by feminine collecting and gathering, the one representing alimentary security and well-being, the other chance and want. To these two ways of life, one followed in the winter, the other in the summer, the Nambikwara react in very different ways. They speak of the former with the melancholy which is attached to the conscious and resigned acceptance of the human condition, to the dull repetition of identical acts,

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

lateral or the patrilateral cross cousin; nevertheless, the chosen interpretation stresses the male side in Nambikuara society, or, let us say, it shows a strong tendency in this direction. At the same time we can see in such a solution a specifically social structure beginning to superimpose itself on the formerly simple familial units. 571 607 582

We do not intend in any way to base a theory of the origin of dual organizations on these restricted observations, the character of which is mainly anecdotal. However, this is a case where "the characteristic features of the sib organization are in some measure prefigured among sibless tribes";[1] as a matter of fact, in order to fulfil the main requirements of a system of exogamic moieties, it would be sufficient for the new unit, once fixed, to retain the recollection of its dual origin by preserving the habit of not mingling the camp fires. 571 607

Moreover, the extension of the "brother-in-law" relationship provides an instance of the increasingly superior position of the men within the group, since it is through the men that group alliances are brought about, just as wars are waged by men. 571 607 562

The preceding observations have a further value, since with their help we may be able to interpret sociological information found in the older literature on South America, especially that dealing with the Tupi of the Brazilian coast. 000

There are striking similarities between several features of the Nambikuara kinship system and what may be inferred about the ancient familial organization of the coastal Tupi. When describing small details of Nambikuara daily life, one is often tempted to quote Jean de Léry or Yves d'Evreux, so accurately do their words apply to certain live features of Nambikuara society, notwithstanding the fact that they were written four centuries before this culture became known. As a matter of fact, several metaphysical themes are common to both cultures and, indeed, certain names in the Nambikuara religious vocabulary have a conspicuously Tupi origin. The most important similarities, however, are those involving the kinship systems. In both cultures the same three principles of familial organization are stressed and are apparently similarly expressed: First the dichotomy of the parents' brothers and sisters between parallel uncles and aunts, called "fathers" and "mothers," and cross uncles and aunts, called "fathers-in-law" and "mothers-in-law;" secondly, the marriage of cross cousins with the correlative assimilation of parallel cousins to "brothers" and "sisters"; and, finally, the avuncular marriage, which, among the ancient Tupi, seems to have taken the form of a preferential union between the mother's brother and the sister's daughter. 114 171 601

An excellent text by Anchieta gives evidence of the occurrence of the first principle, as well as showing signs of the existence of the other two: 114 171

[1] Robert H. Lowie, *Family and Sib* (American Anthropologist, Vol. 21), p. 28.

291 around the ankles. The Tagnani and Tawite wear similar bands on
184 their upper and lower limbs; theirs, however, are made of cotton, which is used occasionally by the Cocozu to manufacture articles of this sort. [Plates p. 242.] Among the Tagnani and Tawite [239], men often cover their sexual organs with the ends of the straw cord that encloses their hips. But this is not the rule. The Uaintaçu rarely wear any of those bands; and among all groups, a few of the Indians always go completely naked.

[Fig. 29]

291 The women and pubescent girls, young and old, single and married, always wear the hip cord.

[293] Some pregnant women I saw did not wear it; I believe they had freed their abdomen from this strong pressure in order to breathe more easily, or perhaps for fear that the girdle should have a pernicious influence on the foetus.

302 They always wear their hair long, hanging over the shoulders; they clip it irregularly on the forehead with a bivalve shell or a cane splinter. They liked to have us cut it with scissors.

291 They are extremely fond of the hats we wear; it seemed to me that the heat of the sun on their head distressed them greatly. They will give almost as much for a hat as for an iron axe.

301 One of the jaguar-hide helmets which are now in the [National] Museum was obtained in the village of Urutau in exchange for an old and well-worn hat of ours, in spite of the fact that those helmets are highly prized [by the Indians].

They do not normally wear hide or feather head ornaments. When they are in a festive mood, they cover themselves with crowns [diadems] that will be described later, or with jaguar-hide helmets. It is likely that they also use such ornaments for certain ceremonies, but we ascertained nothing about this.

[Fig. 32]

[240] From their ears they hang triangles of mother-of-pearl, [304] which they extract from river shells; when the hole tears, splitting the lobe in two, they do not hesitate to bore another one.

[562] The men are much vainer than the women; they adorn themselves with feather diadems, earrings, pendants and necklaces, while the women limit themselves to a few of these.

301 imitate our wedding rings; necklaces [242], several meters long, made of black beads; the feathers of black birds; the limbs of coleopters, also black; all attest to this preference.

[Fig. 45]

[237] The women make beautiful one-piece bracelets from the tail rings of the giant armadillo which they polish with wet stones. [See Fig. 65, p. 59A]

[184] The Uaintaçu Nambicuara, who come to Campos Novos by way of the Guaporé and who are much more insolent, crude, wary and suspicious, do not attempt to wear the delicate lip plugs used by their relatives.

Some of them wear a porcupine quill fastened to their lip; others, a wooden splinter or a spike from some tree.

291 562 Also characteristic of the whole Serra do Norte and Juruena Valley is a palm-fiber cape (Inlacu), which hangs down the backbone from the neck. [See Fig. 66, p. 59B.] Women do not wear it; it is another example of male foppishness.

302 Body painting with urucu constitutes part of the ornamentation for men as well as for women.

[Plates, p. 236]

[243] They paint themselves on festive occasions; they do not [515] draw lines on the skin, but smear the dye all over their face. Women, after bathing, redden their whole body in this fashion.

[Fig. 44]

[384] The Indians of the Juruena dissolve the urucu powder in pure water; the Tagnani prepare a paste or cream by mixing the dye with the fat of various animals, and perfume it quite pleasantly by way of some unknown process. (1)

1. The Bororo use mastic resin to perfume the urucu paste. See Alfredo de Andrade, "Estudo dos materiaes corantes [A Study of Coloring Materials]," Archivos do Museu Nacional, Vol. 28, p. 183.

854 Children are treated with great affection and refused nothing. They are rarely punished. Many an Indian, already elderly would walk for leagues [256] with a child on his back to come to us and give the little one some of the presents we were distributing.

622 They have no clearly defined chiefs. Some men the muleteers call chiefs are merely individuals of some influence frequently heeded by the others.

578 622 One day, in Campos Novos, we were visited by the Cocozu and Anunze. Several young men of both groups spent the night there: Nuleke, Krikriceknerá (Manduca), Paixão, Preguiça [Port. "sloth], Damasceno, and the famous Cavagnac, supposed chief of the Urutau village, a scoundrel who used to ambush the muleteers on the Line and take their packs.

On the following day many Uaintaçu came; they were bold, rough, and quite unpleasant people.

The others, when they saw the Uiantaçu approaching, gave signs of agitation. Finally the Uaintaçu arrived, very much excited by the presence of our guests. An endless discussion ensued among the three groups. They all talked and gesticulated in angry fashion, with gleaming eyes, ready to attack each other. Fearing a conflict which would be disastrous on every count, we intervened by distributing cigarettes, matches, axes, etc., in order to distract them. They calmed down. But some of the Cocozu and Uaintaçu boys continued to argue and were gradually surrounded by the others who listened attentively. Two on one side would speak; two from the other side would reply. The two Indians who talked, Damasceno and Cavagnac, were more intelligent, clever and bold. There was nothing to indicate that they were true chiefs, recognized as such on every occasion. They were temporary chiefs.

622 Among the Tagnani and Tawite, on the other hand, there are clearly defined secular chiefs. One of them stood out because he wore no ornaments whatever [257]. He actually commanded and was obeyed by all. He had three wives.

562 The status of the Nambicuara woman is not so degraded as that of other Brazilian Indian women. She works hard, it is true. She [562] gathers fruit, grates manioc, handles the mortar and pestle, erects the hunting shelters, spins cotton, carries the family belongings, cares for the children, takes part in cultivating the plot; but usually she is

542 treated with great affection. The men are jealous of their wives, and
[137] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paressi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uétü!" (son).

888 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urutau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own aticú and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[771] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunze threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--
the Cocozu in circular pits, the Tagnani in elongated graves.

595 husband and his first wife will also play, while bathing or near the
182 camp fire. She is in no way excluded from the gay life. Moreover, her slighter participation in relationships of amorous comradeship is compensated by a greater respectability and a certain authority over her young companions. It must not be forgotten (and we have
595 pointed it out in the study of the kinship system) that the polygamous
582 marriage presents a double aspect—the marriage of a man with a woman and with some "daughters" of the latter, or with a woman and the "sisters" of the latter. The respective situations of A1, a2 and a3 and a4 realize the two situations at the same time since, at least in one of the cases (with a4), it is the second oblique marriage within the same line. As example of the first type, we have the marriages of A32 and of A56; for the second type, one can also refer to the marriage of C20 (1).

1. Cf. above, p. 53.

595 The polygamous wives then, as a general rule, belong to a
571 younger generation. The first wife calls them "daughters" or of "little sisters," and they behave as such. A form of spontaneous grouping which one finds realized frequently is the union of the husband's daughters (by his first wife) and his young wives (polygamous). They form a sort of gay and carefree childlike society, but also a more or less subordinate society. We have found households comprised of two (A42, A57, A73, B1, B32, C20), three (A1,) and five (A32) wives. It does not seem that the number of wives is proportional to the social importance of the husband (even though polygamous union itself is conditioned by this), but is rather haphazard.

SEX LIFE

000 We shall begin by giving some information concerning organic activities.

514 Coughing, sneezing, spitting, blowing the nose, belching, ex-
515 pelling flatus, constitute operations which are not subject to any
576 etiquette, and which the vocabulary does not always clearly distinguish (thus: tolũ'ige, b1, to cough, and tolũtiore, b2, to sneeze; kasite, sneeze, and kasi'pe, c, spit, tarni'kititu, a1, to expel flatus or to defecate). All of these needs are satisfied publicly, without precaution, ritual gesture or formula, as much on the part of the executor as on that of the spectators. No attention is paid to them, and everything

[734] wife. We have already cited the case of the two little girls
593 a8 and a9 whose stepmother (a7) refuses to take care of them.
Their father (A6) must, then, assume many of the lesser func-
[842] tions. At the time of departure for a trip, it is he who prepares
the basket for the elder, measures on her the length of the tump
line, and shortens it thanks to the free end which he fastens
passing it several times through the holes of the basket-work.
869 It is also the father who tells the children the traditional stories.
538 And, with a view to shortening and making more intelligible
these often long and repetitious accounts, he applies himself
to transposing them in a style especially adapted for children.
Thus, the infant's version of the story of the Flood (1) is as

1. See below, p. 120, the complete version of this story.

follows:

15. wãitento dohonenãiram kãnaram hẽpatnẽ atãtene
nẽjdenkjathattene yafudõnle. (b1)
Everyone was dead! There was no one left! Not a man!
Everyone was dead! Nothing more!

595 Relationships of a particular nature exist in the case of
●571 polygamous marriage between the children of the first wife and
their young stepmothers. Even though the latter are called
"mother" or of "sister of the mother" by them, they live in a
state of companionship with them, especially with the girls,
which also extends to all the children of the group. We have
already dwelled on this society of girls and young wives who
take collective baths, go to defecate in a group, smoke to-
gether, joke and give themselves over to rather farfetched games,
such as spitting long jets of saliva in one another's face. An-
other example: a3 and a4 play with their stepdaughter a5. One
of them pushes her and throws her to the ground with such
violence that her head cracks against the ground and the little
one begins to shriek. The two young women heap mockeries
upon her. Finally, the youngest goes to drag her from the
ground almost by force and pushes her toward her mother, with-
out ceremony, like a package. These relationships are close,
appreciated, but without courtesy, like those which young boys
might have in our society. They rarely imply service or atten-
tion. Thus, A1 and his polygamous wives a3 and a4 divide a

595
57/ piece of small animal. a5 asks for part of it and a4 answers: "Let your father give you his." These relationships bring about
§56 a rather curious consequence: the young girls become independ-
595 ent more rapidly than the boys. They follow the young wives, take part in their activities, while the boys, left to themselves, timidly try to adapt themselves to the group but without great success, and usually remain, at least in earliest childhood, beside their mothers.

§57 [70] Considering now the relationships of children among themselves, the most striking characteristic is the absence of play. In certain groups (central and south), the children manufacture, although rarely, small objects of rolled or braided straw, but generally they know no other distraction than fights or contests which they do together, and lead an existence modeled on that of the adults. In fact, they carry on the normal day of the women: in the morning, preparing the manioc, then the cumaru nuts, bathing when it begins to get warm; when the sun is very high, retiring to the shade, and before night, gathering wood for the fire. Likewise, the girls learn to weave, they walk around, laugh, sleep. The little boys do not begin to play with little bows and imitate the male pursuits until much later (from 8 to 10 years on). But all become rapidly conscious of the fundamental and sometimes tragic problem of Nambikwara life, that of nourishment, and of the active role that is expected of them. They take part in the harvesting and collecting expeditions with great excitement. In time of need, it is not rare to see them seek their own food outside the camp, working to unearth roots, or walking in the grass on tiptoe, a large stripped branch in hand, to catch grasshoppers. The little girls know what an important role the women have in the economic life of the tribe, and are impatient to make themselves worthy of it.
[231 Thus, we find a young girl (b5) who tenderly carries a puppy
483] in the tump line that her mother uses for her little sister, and we make the remark:

16. uainuitte ufkɔrage
She caresses the little puppy?

Her mother answers me:

uefkuatnore uainuetuikade?ena tãjtniene
The little girl caresses the puppy (because she wishes) to raise it.

so which the little girl adds gravely:

In older versions, the old woman (since the old women share the magic powers of the men among the Nambikwara as also in other tribes) (4) was undoubtedly not content with measuring the

4. Cf. above, p. 101.

fall of water by the duration of the fall of her nuts, she actually provoked it by throwing them. Whatever the case may be, "magical projection" is probably found at the origin of the theme of the throwing of small fruits or grains in South American folklore.

[122] PSYCHOLOGICAL ATTITUDES

The Nambikwara offer the observer a very special psychological and moral aspect, and one which we have not found again either among their immediate neighbors--Paressi, tribes of Guaporé, and Tupi of the Gi-Parana--or among other South American tribes. It is worth an attempt to separate its principal characteristics. Few of the primitive South Americans display so much spontaneity and freedom in their behavior. Few manifest such ease in psychological relationships, and such grace of expression. Thus, in their relationships with the ethnologist, the informants introduce formulae which constitute true sociological inventions in order to respond to a new situation, on the part of individuals who do not use either a formula of greeting or of leave-taking in their own social relationships:

60. tai undejretnĩ ta ekiredniẽ pã jiren undetniẽ
tatjene pã iritjani. (b1)
I am going to sleep, I am going away, you go to sleep,
I will stay, you go away.

Or to put an end to an interrogation of which they are weary:

61. iejũlana amnentiẽ hikənarigna iatjeu amdeniẽ
kənahãtiaj jedetniẽ. (b1)
This is useless, it must be left; one does not see
clearly any more, this is useless, let us leave it;
tomorrow we will talk.

Or again:

62. nakanajõnjani nãhin nalirjani. (b1)
I have forgotten, wait till I remember.

Their daily life is full of exuberance. It is not only in the games of ball that one hears joyous exclamations:

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

607 838

sometimes the fathers of several children, walking together at dusk and tenderly embracing each other; always

tarãtę ialãsiętę

(these are) brothers-in-law embracing (each other).

Certain games, too, such as the "scratch game" (in which the opponents try to scratch each other especially in the face), are commonly played by brothers-in-law.

607 571

But the close relationship between "cross cousins actually or potentially allied through a sister's marriage"—the more accurate translation of the aboriginal term for brother-in-law—may extend far beyond the family tie. Actually, it is sometimes used to establish between individuals not belonging to the same kin group new links of a special nature, the function of which is to amalgamate into a single familial unit several formerly unrelated groups. This is brought out clearly in the following case.

184 571 621 197 731

During the past twenty years, several epidemics nearly destroyed the central, northern and western divisions of the Nambikuara. Several groups were decimated to such an extent that they could no longer successfully maintain a socially autonomous existence. In the hope of reconstituting functioning units, some of these, therefore, attempted to join forces, In the course of our field-work we met and worked with such a merged group made up of seventeen individuals using the northern dialect (*Sabãnę* group) and thirty-four using the central dialect (*Tarãndę* group). Each of the originally distinct groups, however, lived under the guidance of its own chief, although both leaders closely cooperated. It is probable that the demographic crisis did not by itself account for this situation, since the people of the second group formed merely a fraction of a more numerous unit from which it had split off for reasons unknown to us. However, from several events which occurred during our stay with them, we deduced that the break had been caused by political dissention, the details of which remained obscure to us. In any event, these groups now travelled and lived together although two separate but contiguous camps were maintained in which the families formed distinct circles, each around its own fire. The most amazing feature of this curious organization was that the two groups did not speak the same language and were able to understand one another only through interpreters; fortunately, one or two individuals belonging to each group had sufficient knowledge of the other dialect to act as intermediaries. Even the two chiefs could not communicate directly. The problem of whether these dialects belong to the same linguistic stock need not be raised here; but the Northern group undoubtedly must be classified with the Nambikuara cultural family because of the similarities of material culture and of the life pattern, and chiefly because of the psychological attitude of the people, who very evidently believed in their close affinity to the Central group.

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

571 607 A more fundamental problem raised by the union of the two groups, namely the nature of the relations to be established between their respective members, was solved by the common statement that all the male members of the Sabáŋę group were to be acknowledged as the "brothers-in-law" (*tarúlę*) of the male adults of the Tarúndę group, and, conversely, that the latter were to be acknowledged as "brothers-in-law" (*iópǫ*) by the former. Consequently, all the "wives" belonging to one group became the "sisters" of the "husbands" of the other, and the "sisters-in-law" of the latters' wives; and all children of both sexes in one group became the potential spouses of the children in the other. As a result, these two groups will be welded into a single consanguineous unit within two generations.

The conscious and systematic nature of this solution cannot be doubted. When asked for their kinship relation to any male adult of the allied group, the male informants, irrespective of the group to which they themselves belonged, never gave a different answer, but always emphasized that the question was meaningless since all the Sabáŋę men were their *tarúlę*, or all Tarúndę men their *iópǫ*. On the other hand, no one seemed to have a clear idea of the exact relationship between the women, the children, or the adults and the children of the two groups. Occasionally the correct theoretical relationship could be deduced; more frequently only the group name was given in reply to our queries: She is calling the other one "Sabáŋę"—or "Tarúndę." Thus it may be assumed that the system was conceived of and applied according to (and exclusively according to) the *tarúlę* (or *iópǫ*) relationship. This inference is rather important because, of course, the same result could have been achieved by other means.

If the sole aim of the system had been to ensure inter-marriage, it could have been brought about equally well in two other ways; perhaps we should say that two different interpretations might have been made of the same phenomenon. In the first place, the women might have been regarded as "sisters-in-law"; or, in the second place, all the men of one group and all the women of the other might have entered a brother-sister relationship. In both cases the result would have been the same as in the accepted interpretation, in which, indeed, these relationships are implied though not expressed. Nevertheless, the solution itself was actually based on the relationship between the male and his allied collaterals, the consequences of which must now be examined.

571 607 582 Two of the three possible interpretations implied the consideration of women; only one was purely masculine, and it is the latter which was adopted by the natives. The reason for the choice is obvious since the problem to be solved was a purely political one, concerning the chieftainship, which is exercised by men, rather than the normal mechanism of filiation, the pattern of which seems to be matrilineal. In a simple system of cross cousin marriage, such as that of the Nambikuara, the brother-in-law may be either the matri-

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

lateral or the patrilateral cross cousin; nevertheless, the chosen interpretation stresses the male side in Nambikuara society, or, let us say, it shows a strong tendency in this direction. At the same time we can see in such a solution a specifically social structure beginning to superimpose itself on the formerly simple familial units.

We do not intend in any way to base a theory of the origin of dual organizations on these restricted observations, the character of which is mainly anecdotal. However, this is a case where "the characteristic features of the sib organization are in some measure prefigured among sibless tribes";[1] as a matter of fact, in order to fulfil the main requirements of a system of exogamic moieties, it would be sufficient for the new unit, once fixed, to retain the recollection of its dual origin by preserving the habit of not mingling the camp fires.

Moreover, the extension of the "brother-in-law" relationship provides an instance of the increasingly superior position of the men within the group, since it is through the men that group alliances are brought about, just as wars are waged by men.

The preceding observations have a further value, since with their help we may be able to interpret sociological information found in the older literature on South America, especially that dealing with the Tupi of the Brazilian coast.

There are striking similarities between several features of the Nambikuara kinship system and what may be inferred about the ancient familial organization of the coastal Tupi. When describing small details of Nambikuara daily life, one is often tempted to quote Jean de Léry or Yves d'Evreux, so accurately do their words apply to certain live features of Nambikuara society, notwithstanding the fact that they were written four centuries before this culture became known. As a matter of fact, several metaphysical themes are common to both cultures and, indeed, certain names in the Nambikuara religious vocabulary have a conspicuously Tupi origin. The most important similarities, however, are those involving the kinship systems. In both cultures the same three principles of familial organization are stressed and are apparently similarly expressed: First the dichotomy of the parents' brothers and sisters between parallel uncles and aunts, called "fathers" and "mothers," and cross uncles and aunts, called "fathers-in-law" and "mothers-in-law;" secondly, the marriage of cross cousins with the correlative assimilation of parallel cousins to "brothers" and "sisters"; and, finally, the avuncular marriage, which, among the ancient Tupi, seems to have taken the form of a preferential union between the mother's brother and the sister's daughter.

An excellent text by Anchieta gives evidence of the occurrence of the first principle, as well as showing signs of the existence of the other two:

[1] Robert H. Lowie, *Family and Sib* (American Anthropologist, Vol. 21), p. 28.

621 115 157 622 177 601 feather ornaments, hair styles, arms, such as we have seen among neighboring or faraway peoples. Did he entertain the hope of perfecting the material and intellectual equipment of his group thanks to this information? It is possible, even though his dreamy temperament hardly ever drives him to realizations. However, one day when we were interrogating him concerning the Pan pipes, to verify the area of diffusion of that instrument, he answered that he had never [537] seen any, but that he would like to have a drawing (different from group a, group b does not have real pipes of Pan, but instruments made of two or three tubes of equal length and giving approximately the same note, tied together with cotton thread and wax). With the aid of our sketch he succeeded in making a crude but usable instrument.

621 601 B1 had two wives: b2, about 25 years, mother of two little girls of 5 to 7 years, b4 and b5; and b3, older than he (about 40 years old), mother of a boy of 7 years, B6, and of a girl of 9 years, b7.

Fire 2 (8 and 9). --A son of a deceased brother of B1, whom the latter then calls "son" (about 25 years old), and his wife about 18, sister of B13; no information about the father and mother.

Fire 3 (10 to 12). --B10 is a brother of B8, and B1 calls him "son" also. His wife, b11, of undetermined parentage, is about 20 years old, and his daughter b12 about 6.

Fire 4 (13 and 14). --This household presents the only sure case of oblique marriage in group b1. B13, about 25 years, married a girl of 16 or 17, b14, daughter of a dead son of the dead brother of B1; he calls her then, as seen before, tasuite.

Fire 5 (15 to 17). --These three individuals are the last survivors of a related group destroyed by an epidemic. After the disaster, they joined the band of B1. B15, about 35 years, is the brother of b2, thus tarute of B1. His wife, the same age, b16, is a sister of B1, thus ndedere of b2. Their son, B17, is about 5. The daughters of B1 call him (B17) "husband," and he calls them "wives."

621 574 601 [52] The visitors. --They came from the region lying between the sources of the tributaries of the left bank of the Juruena and of those of the right bank of the Guaporé. All were related to their hosts, and were distributed among three generations. The oldest was comprised of three individuals: B18, about 50 years old, father of B21, B25, B27, and B29; his wife b19, the same age, paternal aunt of B1; and the brother of the wife, B20, 40 years. Besides the children of B18 already mentioned (from 20 to 30 years old), the next

621 generation is composed of b26, wife of B25 (about 20 years); of the
574 husband of b29, B28 (about 25); of the wife, b22, of B21 (same age);
601 of his brother B24 (20 years), both children of a deceased sister of B18; and of a widower of about 40 years, B30, brother of B15 and of b2, who had been married to a sister of B1. The young generation is represented by only two children, b23, about 7 years, daughter of B21 and b22, and b31, about 10 years, daughter of B30, mother dead. For the whole picture of genealogical relationships, the reader should refer to Figure 15.

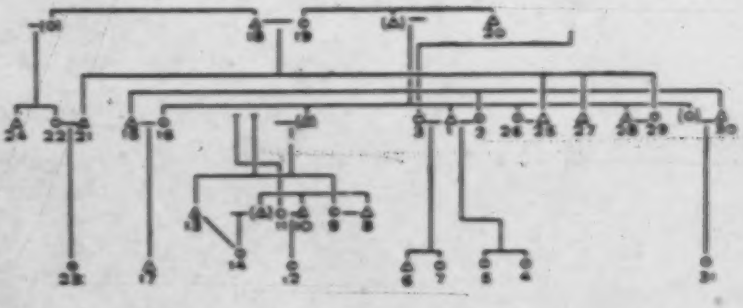

Fig. 15.

601
621

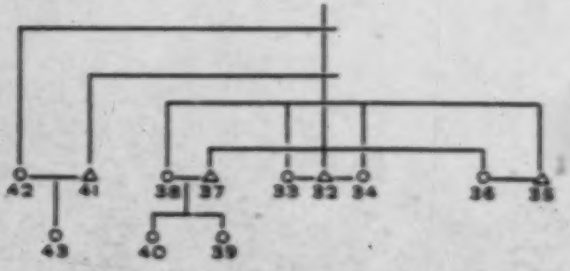

Fig. 16.

601 Fire 6 (19 to 22). --The chief, or rather, it seems, the shaman of
621 group c, is 30 to 40 years old, "brother" of c23. His dispositions are
[754] friendly and mysterious. We shall encounter him farther on (2). He

2. P. 103.

has two wives, c19 and [54] c21, very pretty girls of 17 or 18 years, "sisters" of the dead husband of c23. Here we have, then, a good example of sororal polygyny. The second woman has a little boy of 3 years, C22.

Fire 7 (23 to 25). --The woman, c23, is over 40; she is a widow and seems to enjoy great consideration. Her numerous "brothers" provide for her as well as her children, and like C20, she is apt to receive supernatural revelations (1). She has a son, C25, about 14

1. Cf. p. 101.

years old, and a daughter, c24, about 10. Concerning them, refer to page 34.

Fire 8 (26 and 27). --A young couple of about 18, whose parents must be dead and whom the elders of the group call "grandchildren."

Fire 9 (28 to 30). --C28, about 25 years, is a "son" of C6; his wife, c29 is older than he (over 40); she is called "daughter" by c19 and c21, although they are by far younger than she; her daughter c30 is about 2 years old.

Fire 10 (31 to 33). --c32, about 40 years old, is a younger sister of c23; she has two daughters: the eldest, c31, about 17, is married; the younger, c33, still a baby. The husband and her son-in-law are absent; they are said to be on a trip together. The group sees to the needs of the two women.

It is suitable to add a visitor to this list, C34, about 30 years old.
[574] He is the brother of c12 and, during his stay, he receives the hospitality of household number 4.

RELATIONSHIPS BETWEEN INDIVIDUALS

Husbands and Wives

543 To understand well the attitude of the two sexes as concerns one another, it is indispensible to keep in mind the fundamental character

595 husband and his first wife will also play, while bathing or near the
182 camp fire. She is in no way excluded from the gay life. Moreover, her slighter participation in relationships of amorous comradeship is compensated by a greater respectability and a certain authority over her young companions. It must not be forgotten (and we have
595 pointed it out in the study of the kinship system) that the polygamous
582 marriage presents a double aspect—the marriage of a man with a woman and with some "daughters" of the latter, or with a woman and the "sisters" of the latter. The respective situations of A1, a2 and a3 and a4 realize the two situations at the same time since, at least in one of the cases (with a4), it is the second oblique marriage within the same line. As example of the first type, we have the marriages of A32 and of A56; for the second type, one can also refer to the marriage of C20 (1).

1. Cf. above, p. 53.

595 The polygamous wives then, as a general rule, belong to a
571 younger generation. The first wife calls them "daughters" or of "little sisters," and they behave as such. A form of spontaneous grouping which one finds realized frequently is the union of the husband's daughters (by his first wife) and his young wives (polygamous). They form a sort of gay and carefree childlike society, but also a more or less subordinate society. We have found households comprised of two (A42, A57, A73, B1, B32, C20), three (A1,) and five (A32) wives. It does not seem that the number of wives is proportional to the social importance of the husband (even though polygamous union itself is conditioned by this), but is rather haphazard.

SEX LIFE

000 We shall begin by giving some information concerning organic activities.

514 Coughing, sneezing, spitting, blowing the nose, belching, ex-
515 pelling flatus, constitute operations which are not subject to any
576 etiquette, and which the vocabulary does not always clearly distinguish (thus: tolũ'ige, b1, to cough, and tolitiose, b2, to sneeze; kaite, sneeze, and kasi'pe, c, spit. tarni'kiriru, a1, to expel flatus or to defecate). All of these needs are satisfied publicly, without precaution, ritual gesture or formula, as much on the part of the executor as on that of the spectators. No attention is paid to them, and everything

514
515 leads to the belief that the terms employed to designate them, so
576 easily interchangeable, refer to more general forms of behavior.

515 To blow the nose, one takes in both hands a twig or a stalk of dry grass, folds it in two, and pinches the nose in this improvised nut-cracker while blowing strongly. The mucus is collected by pinching the instrument together under the nose, and the whole thing is thrown away after having been plunged into the sand to dry it.

514 The men urinate standing or while walking. The women crouch, leaning slightly forward and sprinkle themselves with sand to dry themselves. The children act like the adults of their sex, except that the little girls often urinate standing up with their legs separated. The men defecate alone in the bush neighboring the camp, the women do the same, or go in a group. On such occasions one perceives the reality of the group formed by the girls and the secondary wives of polygamous marriages. Thus, a3, a4, a5, a8, a19, and a20 are accustomed to isolate themselves by twos, threes or fours. Elimination is done in a crouched position, in a hole summarily dug in the sand with the hands, or directly on the ground. A small branch is used to clean oneself, and sand, for drying.

841 The women are forced into isolation only at the time of their [63] first menstruation.(1). Following this, they are only subject to

1. Cf. below, p. 109.

certain alimentary and sexual prohibitions:

6. jaŋoõdage edẽde edẽde edẽde kano kano kano kano kano kanabo huiire tamindige. (b1).
The woman has her menses every two moons (?), then she waits one day, one day, one day, one day, the next day she can eat, copulate.

The taboo on eating for five days is not rigorous, and usually concerns certain types of food. Besides this, a woman cannot bathe during her menses, as is, of course, the general rule for the two sexes during this period. One goes to the river to put water in a gourd and pours it over the body while crouching. Otherwise, the woman takes care of all her habitual occupations. No precaution is taken against
841 the flow of blood, and as no trace of it is noted, it must be supposed
147 that it is greatly reduced (2).

841
147
171 2. Among the Bororo, on the contrary, it is easily seen which women are indisposed. But the above remarks seem to be indicative of a fairly general state of affairs

63. tenũkuẽ tenũkuẽ utanãtiri (b1). 157
To me! To me! Throw! 521

However the artisan at work also makes his wife, child, neighbor participate in the execution of the work on whose vicissitudes he comments gaily:

64. itiouĩ taninẽ diuĩn... ãmi... kãdaha... munjalina... kãdjanene... nooua... taluunlẽ... nohin... ishena... muhjena. (b1)
Hold it [the cord] so that I can twist it... let it go! It fell!... There!... It is difficult!.... It is done!.... Does it suit you?.. It is ugly!... No, it is pretty!

The last formula is ritual, it is the one they use at the end of chants and dances; the protagonists excuse themselves: "it is ugly"; and the audience responds: "No, it is pretty!" [108]

[123] This politeness is not always without malice, and compliments sometimes hide attempts at mockery. We cited above the formula used by a group to depreciate their dances in comparison to those of their companions they have just met; (1) but a few hours earlier, disdaining a present of beads 157 521 576

1. Cf. p. 92.

which I offered and which were not much appreciated because of their color, they advised me:

65. mpãtin maimãndẽ tunuhĩnde (b1)
Keep them to give to the Maimandẽ.

One day we were sold poison tubes (by group a2) described as so dangerous that we should abstain from ever opening them under pain of immediate death. They proved to be empty, which testifies to great ingenuity if the mystery was improvised on our account. In any case, it throws a curious light on the relationships between neighboring groups. 439 789 157

181 Caduveo, perhaps remindful of their slave-owning past, are proud, conceited, and boastful. The
171 Arawak-speaking Terena and Paressí, like the Arawak-speaking Waurá, are quiet, unassuming, friendly, and ready to help yet take no liberties. The Umotina speak only when spoken to and appear to wish to be by themselves. They provide information if they think the gifts are sufficient and to their taste; otherwise, they saunter off and are never available when required. An Umotina does just what he wishes to do and hates any kind of dictation. The Bacairí and Camayurá are intimately friendly, talkative, and ingratiating, expect gifts and bestow gifts in return, volunteer information, are full of humor and curiosity, and are clean and polite.

181 The Nambicuara, on the other hand, are surly,
●576 and impolite even to rudeness. On many occa-
609 sions when I went to visit Julio at his camp he was lying down near a fire and as he saw me approach he turned his back to me saying that he did not wish to talk. The missionaries informed me that a Nambicuara will ask for some object several times and if it is not given to him he will try to take it. In order to keep the Indians out they would sometimes close the screen door, but if a Nambicuara really wanted to enter he would tear a hole in the screen and walk in. The Nambicuara have two well-recognized ways of showing disgust or disdain. One day I stopped a woman carrying a burden basket to take her photograph. She evidently did not like being stopped, for as she passed me a moment later she turned her back to me and passed wind. This the missionaries claimed is a very common custom of the Nambicuara. The men have an even stronger way of showing disbelief and disgust. After listening to something with which he does not agree a Nambicuara will get up, grasp his penis, and slap it sharply against his groin and walk off with a "that for you" look. One might call it a Nambicuara "raspberry." Although some of these personality
181 traits are old and culturally defined, there appears
648 to be little doubt that the Nambicuara have a deep hatred of the white man. They realize that the white men are rich compared with themselves and that contact with the whites has brought diseases which are killing them off rapidly. They realize, too, that both the whites and the Paressí consider them in the lowest category of human beings.

621 We shall comment later (1) on the complex motives that might have induced

1. Cf. p. 77.

[197] these two bands, speaking different dialects and who were not even capable of understanding one another without an interpreter, to practically merge. It seems that group b1 was composed of the rare survivors of a formerly important formation now disappeared, living previously in two distinct groups, around the sources of the eastern tributaries of the Roosevelt River. We have already tried to calculate these losses, resulting from recent epidemics (2). Group c had,

2. Cf. above, p. 6.

without doubt, gone through the same hardships. Moreover, its [578] position had been compromised by antagonisms with other bands rising from the same dialect, and who had formerly been their allies. A visit, with a commercial goal, of related Indians originally from the south (members of the group known by the name of Kabisi) must have raised the forces of group b1 to 31 persons for 621 several days. Here is its composition at this moment:

115 157 622 601 Fire 1 (1 to 7). --The family of the chief of the band. The chief, B1, is 30 to 35 years old, and one of the most intelligent Indians whom it was our privilege to encounter. But he is intelligent in a way very different from A1. The latter is prudent and very resourceful, always meditating some political combination. On the contrary, B1 is not a man of action, but rather contemplative, with a charming and poetic spirit, and rich sensibilities. He is fully conscious of the inevitable decadence of his people, and this conviction often shades his words with a subtle tint of melancholy:

(4) ĵoãmditnʔẽ ñjãñaĵne heni niho ãmdedñjẽn. (b1)

"I also did the same thing, now it is finished," [51] he says, remembering happier days when his group, far from being reduced to a handful of individuals incapable of keeping alive their traditional customs, was comprised of several hundreds of participants faithful to all the manifestations of the Nambikwara culture. His curiosity toward our customs and towards those which we had been able to observe in other tribes is just as great as ours. With him, ethnographic work is never unilateral. He conceives of it only as an exchange of information, and what we bring him is always very welcome. Often [17] he even asks us for—and preserves carefully—drawings representing

He was completely naked, that is, divested of his
756 necklaces, bracelets, earrings, and belt, and by the light of our
[301] electric lamps we could make out his tragic expression and his pale complexion. He let himself be helped to the camp without difficulty, where he sat down without a word and in a completely impressive attitude of dejection. Little by little, his story was drawn from him by an anxious listener. He explained that he had been carried off by the thunder (amõ), [a storm had broken the same day]; the thunder had carried him in the air to a point which he designated at a distance of 25 kilometers from the camp (Ananáz River), had divested him of all his ornaments, then brought him back the same way and left him in the place where we had discovered him exhausted. Everyone went to sleep commenting on the incident and the next morning, C20 had recovered not only his habitual good humor, but also all his ornaments, which amazed no one and for which he offered no explanation. But the following days a very different version of the event began to be peddled by the Tarundé. They said that, far from having entered into relationship with the other world, C20, under the cover of a magical disappearance, had gone to undertake
● [578] some transactions with a band of Sabané Indians who were camping in the vicinity. These insinuations were never developed further, and the official version of the affair continued to be ostensibly admitted. However, in our personal relationships, B1 let his preoccupations be seen upon several occasions. As the two groups left us shortly after, we never found out the outcome of the story.

756 No information has been uncovered concerning the manner of
278 naming the shaman as such. In the preparation of the arrow poison, C20 was assisted by his potential son-in-law C25.

* * * * * *

622 [104] Besides his supernatural attributes, the chief, or shaman,
756 plays another role, that of "leader" in ceremonies and celebrations.
796 The Nambikwara have three types of ceremonies. Those which mark the critical moments of each one's existence, such as birth, initiation, puberty, marriage, death; the seasonal festivals; and finally, the ceremonies celebrated on exceptional occasions: war and hunting or scavenging expeditions. We have already alluded to the rites of war, and we shall speak farther on of the ceremonies of the first type. We shall limit ourselves here then to some brief observations concerning the others.

had been poisoned. An attack of reprisal was carefully prepared and took place, in the course of which A1 and A5 distinguished themselves. The six persons composing the mission were killed by beating or pierced with arrows, including a baby of two. Only one woman was found alive by an expedition sent to aid them from Cuiabá. The version which she gave of the events coincides exactly with that which we collected from the main protagonists of the other camp. 177 648 797 [726]

Poison was still to play a role in the life of A6, and this during our stay. We found ourselves visiting (August 1938) at the camp of a neighboring group (a2), and relationships became quickly strained between A6 and our hosts, undoubtedly over the question of women, so that he got the habit of coming to my camp to seek a more friendly atmosphere, at the same time that he shared my food. This fact was noticed, a delegation of four men came to find me one day, and in quite a menacing tone of voice told me to mix some poison (which they brought me along) in the next dish which I would offer to A6; they thought it advisable and indispensable to do away with him at once, for, they told me, he is "very wicked" (kakore) and "is worth nothing" (aidotiene). I had the greatest difficulty in getting rid of my visitors without opposing them with a refusal which in turn would have exposed me to animosity which I had just learned it was better to avoid, and I considered my best plan of action to exaggerate my ignorance of the language, and to feign obstinate lack of comprehension. After several attempts, my visitors retired very disappointed. I warned A6 who immediately disappeared. I was to see him again only four months later. 278 578

These incidents are characteristic of Nambikwara psychology. The Nambikwara are very open, confident and spontaneous, but they are very sensitive and react with great violence to deception [125] or disappointment. Few primitives are as easily accessible. Few give as free access to their intimate lives, to their beliefs, daily acts, thoughts and sentiments. But despite this facility and cordiality, the visitor, be he an ethnographer or a member of a neighboring tribe—must constantly be on guard and watch his actions; for the slightest imprudence, the least clumsiness, may incite reactions difficult to evaluate among his hosts, and in connection with which recent events are always present to recall that they may be extreme. A6 offered a perfect example of this confidence and spontaneity, allied with brusk manifestations of violence and irritability. 157 648

Thus, the Nambikwara character alternately presents two aspects, or more exactly, testifies to a double nature: one which we shall call positive, and which goes much farther in this sense than among many Indians in contact for centuries with the whites; and the other, of metaphysical nature, whose rigor and exaltation at times evoke the mysticism of the North 157

101 The position of all groups known to be scattered through the Serra do Norte and Juruena Valley is recorded on the ethnographic map of the region which goes with these notes.[1]

[218] The exact meaning of the names cited above cannot yet be given with certainty. In the light of existing data, however, their study leads to the following conclusions which cannot be far from the truth.

Cocozu: "Uncles"; thus called by the others, perhaps, because they are the most primitive members of the whole tribe.

[578] Anunzu: This is clearly a corruption of the term anungzú or anungçú, which means "woman's milk"—a disparaging epithet like so many others found throughout the Americas; it may mean "infants" (unweaned babies).

Uaintaçu: Apparently a corruption of nuntaçú, which means "alligator" [Port. jacaré] in the language of the Juina Nambicuara. The Uaintaçu group would thus be none other than the old Jacare tribe mentioned in the first chapter of this work.

Tagnani: They are obviously the Tamarari of the old geographic maps; they should be equated with the Tamarare or Camarare, who gave the river its name and who are mentioned in several ancient documents.

Tawite: This word signifies "child" or "son" [offspring], a common appellation among other tribes as well.

In order to avoid future confusion, I propose to retain the name "Nambicuara" in conjunction with the specific name peculiar to each group.

361 The villages of the Serra do Norte Indians are usually built on the crest of small hills, far from the watercourses. Some are more than one kilometer distant from the nearest river or stream.

It may be assumed that the choice of such sites has a twofold aim: the Indians suffer less from mosquitoes and they dominate the surrounding territory, which is an advantage to people leading as they did up to now a life of constant warfare.

The village is built on a large plaza, fifty meters in diameter; once cleaned of bush, which is rooted up [219] by hand, the ground [535] is kept clear by the constant tread of feet. One night of dancing, with its endless beat along the same path, suffices to smooth out the village square.

1 [See map following foreign text, cat. 116 - Analyst]

854 Children are treated with great affection and refused nothing. They are rarely punished. Many an Indian, already elderly would walk for leagues [256] with a child on his back to come to us and give the little one some of the presents we were distributing.

622 They have no clearly defined chiefs. Some men the muleteers call chiefs are merely individuals of some influence frequently heeded by the others.

578 622 One day, in Campos Novos, we were visited by the Cocozu and Anunze. Several young men of both groups spent the night there: Nuleke, Krikricéknerá (Manduca), Paixão, Preguiça [Port. "sloth], Damasceno, and the famous Cavagnac, supposed chief of the Urutau village, a scoundrel who used to ambush the muleteers on the Line and take their packs.

On the following day many Uaintaçu came; they were bold, rough, and quite unpleasant people.

The others, when they saw the Uiantaçu approaching, gave signs of agitation. Finally the Uaintaçu arrived, very much excited by the presence of our guests. An endless discussion ensued among the three groups. They all talked and gesticulated in angry fashion, with gleaming eyes, ready to attack each other. Fearing a conflict which would be disastrous on every count, we intervened by distributing cigarettes, matches, axes, etc., in order to distract them. They calmed down. But some of the Cocozu and Uaintaçu boys continued to argue and were gradually surrounded by the others who listened attentively. Two on one side would speak; two from the other side would reply. The two Indians who talked, Damasceno and Cavagnac, were more intelligent, clever and bold. There was nothing to indicate that they were true chiefs, recognized as such on every occasion. They were temporary chiefs.

622 Among the Tagnani and Tawite, on the other hand, there are clearly defined secular chiefs. One of them stood out because he wore no ornaments whatever [257]. He actually commanded and was obeyed by all. He had three wives.

562 The status of the Nambicuara woman is not so degraded as that of other Brazilian Indian women. She works hard, it is true. She [462] gathers fruit, grates manioc, handles the mortar and pestle, erects the hunting shelters, spins cotton, carries the family belongings, cares for the children, takes part in cultivating the plot; but usually she is

[581] Dutemõdednige (b1), say the Nambikwara men; "it is a good
582 thing to marry." But it is not easy. The ideal marriage is the one which gives a "young and pretty woman" (monoduinuŝere, b1) whose virginity one will have (to break the hymen: tauorõtige, b1). But such women are precisely the ones who are claimed by the chiefs or shamans, and only a few young men will have a chance to obtain such wives. The others are condemned to a long period of celibacy
[838] which they will break by having sexual relations with their brothers-in-law, or else they will marry an "old woman" who cannot have sexual relations (tiroanebiiŝere, b1), one who is widowed or repudiated, whom no one wants. Such marriages are not rare among the Nambikwara, and are explained by the fundamental economic role of the couple which we have already commented on. But they are not permanent. When the young man feels his position in the group
582 strengthened, or when a better occasion is presented he abandons
586 (amnjõtige, b1) his old wife to take another (ulamtunjõtige, b1) who
587 is younger and more seductive. It happens that a man thus marries three or four wives successively before considering himself satisfied.(1)

[17]

1. Here also, the documents of the 16th century relating to the Tupi support the comparison: "... at times they take some old woman from whom they do not expect children, because there are no others, only so that they will cook the food, since they have no mother or sisters-in-law to take care of them, thus they are cared for, and are contented at present time with some old woman by whom they are always well treated and then taking other women by whom they have children later, either leaving the first wife or keeping her, if she wishes, for the reason mentioned above." (Anchieta, loc.cit., p. 260-261).

The repudiated woman [111] goes to live with her parents if they are still living, joins up with another man if she has the opportunity or even remains her former husband's fire, whose existence she shares and whose tasks she participates in, but in a slightly inferior position. Such is the position of b3 in the household of her ex-husband B1.
Another method of obtaining the young woman desired consists of
336 seducing her, even if she is married. Adultery and more generally sentimental intrigues are very frequent among the Nambikwara,

601 "mothers"), or of the "husbands" of my mother (who are at the same time my "fathers"). It is seen then that a given individual calls all his parallel cousins "brothers and sisters," and his parallel uncles and aunts "fathers and mothers", while he calls his cross-cousins husbands or wives, and his cross-aunts and uncles "father-in-law and mother-in-law" (identified with grandfather and grandmother, thus, more exactly: parents to the second degree). The confusion between gen-
601 erations and degrees thus makes equally possible the marriage of the
582 brother of the mother or of the father, to the daughter of the sister or of the brother, or of the sister of the father with the son of the brother, since, in these two cases, the parents-in-law will be the grandparents, called thus, by the term of parents to the second degree. These marriages, which we shall call "oblique," since they unite individuals belonging to two consecutive generations, are actually practiced.

601 Below is to be found the list of terms of relationship, as they have just been analyzed in their respective relations (Dialect A 1/2).

1. ahuĩnosu (a 1); ahuĩne (a2)..... father, brother of the father, husband of the mother's sister.
2. aʔkenosu (a 1); aʔketosu (a2)... mother, sister of the mother, wife of the father's brother.
3. uettu, uezu ..... child.
4. aʔkiraru ..... son.
5. aʔkineru ..... daughter.
6. akenãnosu ..... older brother.
7. (t)oãnosu ..... older sister.

[20]8. alõnsu ..... younger brother, son of brother of the father, son of sister of the mother.

9. arĩndesu ..... younger sister, daughter of brother of the father, daughter of sister of mother.
10. asũkosu ..... sister's husband, cross-cousin (masc.) (man speaking).
11. aseetasu ..... brother's wife, cross-cousin (fem.) (woman speaking).
12. asĩntu ..... sister's daughter (m. s.), brother's daughter (w. s.), son's wife.
13. asineetu ..... sister's son (m. s.), brother's son (w. s.), daughter's husband.

601 A second difficulty comes up in the designation of parallel cousins. It has been seen above that the same name is used for them which designates the younger sister or the younger brother, whatever their age may be. This [23] usage suggests that the adequate translation of the terms alõnsu, akenãnosu, arĩndesu, (t)oãnosu could be, rather than "elder" and "younger," big brother, big sister, little brother, little sister, with the same ambiguity that exists in our language between the real sense of the adjective and its figurative sense. Be that as it may, one often comes up against a contradictory situation, not only objectively (which does not shock Indian logic, as will be seen in the case of "mothers" younger than their "sons"), but also literally. This is what happens when for example, a woman calls a female cousin arĩndesu who is quite obviously her elder. Then one has recourse to two supplementary terms, sometimes added to classifying terms, but also sometimes replacing them, even when it is a question of designating blood brothers or sisters. These are:

21. toã-nosu : "elder" (to designate a man):

22. toãtadosu : "elder" (to designate a woman).

These terms serve to sharpen the respective position, regarding the generation, for those who are:

23. arĩnẽdesu, or

24. aloneẽnedẽsu,

that is, "one as regards the other of the arĩndesu," or "the alõnsu," which is not permissible in certain instances; while two women can be without difficulty:

25. aseteẽnãdesu

or two men:

26. asukoĩnẽdesu,

that is, "the one for the other," aseẽtasu or asũkosu. Thus we have found women who call their parallel cousins arĩndesu toãtadosu, meaning, "my older little sister."

601 Other difficulties appear in the case of oblique marriages. When
582 the mother's brother marries the sister's daughter, the woman's grandparents are at the same time the husband's parents. When the husband marries one or several daughters of his wife's sister, his own parents are simultaneously the parents-in-law and the great-uncles of his wives. Thence the frequent necessity to differentiate more precisely than the classifying terms permit between mother's and the father's sisters, on one side (that is the potential parents-in-law), and the fathers and mothers of the father and mother (that is the eventual
601 parents-in-law of one of the spouses). The [24] following terms, then,

601 35. tarũtarosu : "old brother-in-law" (tarũte [b 1/2] equals asũkosu [a 1/2]);

36. tuĩtarosu : "old husband" (uĩte [b 1/2] equals ouẽnsaesu [a 1/2]);

37. ianẽrosu : ?

38. asoũkerosu : "old grandfather" or "father-in-law";

[25] 39. taka?kenosu cited with the commentary : "When the
[764] taka?kenosu dies, the alõnsu cut their hair, but not the akenãnosu."

Finally, two terms of relationship express the relations coming from "oblique" marriages and from the division of generations into "elders" and "younger":

40. ajũnkedisu;

41. (t)ãdirikisu.

A man calls the akenancsu of his mother ajũnkedisu (while the term asoũnosu is generally—but not always—reserved for the alõnsu); one and the other are, of course, the asũkosu of his father. The same individual is then called "father-in-law" (asoũnosu) or "husband" (ouẽnsaesu) by the sister of the subject considered, or, if she is married, ajũnkedisu also, the husband then calling him "father" (ahuĩnosu). One sees then that the ajũnkedisu is a man whose daughter or wife I (masculine subject) marry, and whose son my sister marries, if she does not marry the man himself. Thus it is explained that the ajũnkedisu is asũkosu or asoũnosu, to my brother; asũkosu or asineẽru, to my father; akenãnosu or asineẽru, to my mother; ouẽnsaesu or asoũnosu, to my sister; ahuĩnosu, to my wife.

On the other hand, a man calls a woman (t)ãdirikisu who can be arĩndesu or asintu of his father, aseẽtasu or asĩntu of his mother, aseẽtasu or ajẽinosu of his sister, aekẽnosu of his wife. She is then a woman whom I marry or whose daughter I marry. A woman, in her turn, calls another woman (t)ãdirikisu who is a?kẽndesu of her husband, that is, a woman whose brother or son she marries.

601 ●582 One sees that these two names bestow two privileges, or opens a double right: that of the marriage of the mother's brother (and, theoretically, of the father's brother) with his niece; a right belonging essentially to the elder brother; and of the marriage of the sister's son (brother's son) with his aunt. This rule, or rather this possibility is explained on the one hand by the tendency of the Nambikwara towards polygamy, on the other hand, by the scarcity (moreover consecutive) of women. We shall study examples in an instant.

601
●582 A man marries a woman and subsequently her four "daughters" (probably two blood daughters from the preceding marriage, and two parallel nieces). In this case, a2 calls the older wife a2eʲnosu, and the four young ones aseetasu, from which one can conclude that A32 has married at the same time his (t)adirikisu and the latter's daughters.

Finally, in this third case:

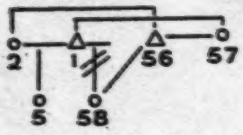

Fig. 8.

Normally, a2 calls a57 aseetasu (wife of her brother), but she disregards the fact that a58 is in the same situation, and keeps for her the name which she gave her before her marriage to A56, of tayettu (my child, daughter of her husband). Her own daughter a5 normally calls a57 a2eʲnosu (wife of the mother's brother), and a58 toanosu (older sister), however, she could marry and call the son of her "mother-in-law" husband as well as the son of her "sister."

Thus the Indians treat abnormal situations resulting from polygamous unions in two ways. Either they admit the creation of a new situation and bless it by revising the names (the newly-married wives are promoted to the class of "mothers," and their parents to the class of [28] "parents of the third degree"; the women are then separated in nomenclature from their former brothers, sisters, sisters-in-law and husbands, who become sons, daughters, daughters-in-law and sons-in-law); or else the former names are simply preserved, the practical knowledge of the situation supplanting the impropriety of the language.

601 But these uncertainties, which appear in the case of verbal contradictions, are completely absent in the presence of real contradictions. These latter are admitted as normal consequences of the system, or more exactly, they are not considered as contradictions. Thus:

601 Grandparents are most often singled out among themselves, and
184 distinguished from the parents of the spouse, which does not happen in system a (1 or 2); also, the son (or daughter) of the brother (or the of the sister) of the father (or of the mother) are sometimes designated by different terms. The groups studied are not dense enough to be able to make a base for a theory of the system in force. Solutions of replacement intervene frequently, and the preferential forms of marriage found are not adequate for generalizations, due to an insufficient number of cases. But the preceding considerations suggest that prefer-
● [582] ential unions, choosing also among certain categories of cross-cousins, could formerly have been in force.

Finally, the names for brothers (and sisters), elder and younger, are more changeable than in system a (1 or 2); and one sees appear a new term designating the brother or the sister of the other sex. This
[177] disorganization of vocabulary can be interpreted as resulting from the influence of the northern system (dialect c), where we shall see later on that it tends more and more to assimilate the system of groups b.

Here is the vocabulary of parentage used, with references to group a (1/2): [Note: m.s. = man speaking; w.s. = woman speaking; m.w.s. = man or woman speaking.]

Dialect a 1/2		Dialect b 1/2	
abuĩnosu	1.	(ta)miĩnde	(my) father, father's brother.
	2.	eĩnde.....	father (equals man).
	3.	uaĩre	father (used to designate absent father, or father of a third person, or the father's brother.
	4.	(ta)miĩnlaore	father's brother (equals other father).
	5.	(ta)mindũdnere	father (father's brother when he substitutes for dead father).
aʔkenosu	6.	(ta)nãde	(my) mother, mother's sister.
	7-8.	(ta)nãdelaore, ndaore.....	mother (other mother; for the mother's sister and the mother of a third).

601 184 born respectively from a brother and from a sister receive different names according to whether they are the sons or daughter of a brother (of a sister), or sons or daughter of a sister (of a brother). Finally, it is no longer normally possible to identify the son-in-law (ŝiauĭtte) and the daughter-in-law (ŝinaĭso) with the nephew or the niece (cross-), and the ŝiuŝi, soeŝo (the same difference as the asuĭttu, asuĭte, and asuelisu or asuiarore of the preceding systems) do not correspond exactly to relatives of the third generation, or to the third degree.

601 184 ●582 These contrasts are clarified when one studies the forms of marriage actually practiced. Of eight marriages, five are "horizontal," that is uniting a husband and wife coming from the same classificatory generation, and three are "oblique," the husband coming from the generation of his wife's mother:

C1 = c2 : brother's son and sister's daughter (horizontal);
C4 = c5 : husband's brother and wife's sister (horizontal);
C6 = c7 : mother's younger brother and sister's daughter (oblique);
C12 = c13 : mother's older brother and sister's daughter (oblique);
C16 = c17 : mother's younger brother and sister's daughter (oblique);
C20 = c8 : husband's sister and wife's older brother (horizontal);
C20 = c21 : husband's sister and wife's older brother (horizontal);
C29 = c28 : brother's son and sister's daughter (horizontal).

[33] In the absence of genealogical facts, one can even suppose that two of the marriages above, classed as "horizontal," are probably oblique, given the considerable difference in age between the husband and wife (C20 = c8, c21); such is often the case of children issued from "oblique" marriages. But even disregarding this possibility, the proportion of "oblique" relationships rises when one passes from marriages as such to the classificatory relationship of husband and wife. Thus C6, for example, calls "wife":

c2 : wife's sister;
c5 : sister of father's wife;
c7 : his own wife;
c8 : sister of father's wife;
c13: wife's sister;
c17: wife's sister;
c21: sister of father's wife;
c24: wife's sister;
c31: wife's sister;

there are actually three horizontal relationships and six oblique (directly or indirectly, through the already oblique position of the intermediary).

We have seen above that the "oblique" marriage is not unknown in the eastern, central, southern and western groups. But it is not so frequent there, and above all, the system of names does not take account of it. The problems resulting from this form of marriage are, then, resolved in two ways: either they preserve the names which have become contradictory, or they displace one or several individuals from the category of kinship to another. The method of the northern system is entirely different, for this is the system whose structure is accommodated to marriage between persons of different generations. (1) This new character is shown by a clearer distinction,

601
582
134

1. For the theoretical interpretation, it will be compared with the Miwok and Ao Naga systems, as we have analyzed them in another work. (Les structures élémentaires de la parenté, ch. 17 and 22.)

within each generation, between the "elder" and the "younger"; in place of four terms distinguishing the relative age and sex, there are only two, iʃla and sabãni, which refer to age and apply indifferently to both sexes. Moreover, the term sabãni tends to have the general meaning of "young" or "little," and succeeds in specifying, from this point of view, whatever the kinship relationship is (2) implying

2. Cf. below, p. 37, text No. 1.

thus that the quality of sabãni is equivalent to displacement to another generation. And actually, even though the older brother and the younger brother can equally claim to marry their sister's daughter, the older brother, even when married to his niece, will continue to be called iʃla by [34] his wife's mother. On the other hand, in the same situation the younger brother sometimes passes to the rank of ʃiauĩtte; he is no longer considered as a brother, but as a son-in-law. Moreover, if the term ʃiauĩtte normally means a "horizontal" son-in-law, that is a cross-nephew married to a daughter, it is significant that a man calls ʃiauĩtte his younger brother, who has married a niece, and even a "wife"; and that a woman designates a younger brother married to a daughter in the same way, as has just been seen. Nevertheless, a man calls his cross-cousins (fem.) and his sisters' daughters indiscriminately iʃtta (wife), while distinguishing the husbands of his "wives" as ʃiauĩtte (horizontal son-in-law), sabãni (or ʃiauĩtte, replacing sabãni) and iʃla.

601 It might be considered that these differences as regards the other
184 systems are purely formal. They bring on, however, some important
582 consequences. The preferential marriage between mother's brother and sister's daughter must introduce asymmetry between the children of the brother and those of the sister, thus justifying the use of different names in the two cases. For the same reason, one sees a shift of a classificatory generation appear between a woman who has married an uncle, and that of her parallel cousins. Here is a striking example:

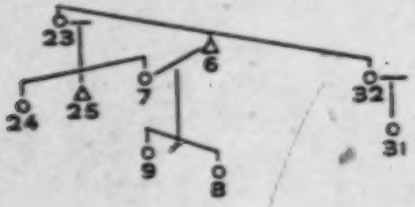

Fig. 10.

c23 calls C6 (in reality, sabãni) ʃiauĩtte; thus her daughter c24 calls him tĩ'mo (husband), since he is married to her sister, c7, and their brother C25 calls him ʃõpa for the same reason. For c23, her granddaughters (and nieces at the same time) c8 and c9 are ʃiuʃi, called tastero by the sister of the mother c24, and aʃginu by the brother of the mother C25. But if one looks at it from the point of view of c31, the essential fact is not, as in the preceding cases, that C6 has married a daughter or a sister (here, a niece or a parallel cousin), but that he is the mother's brother. Consequently, she calls him kodʒka (father-in-law), and she calls the wife of C6 ʃiʃko (mother-in-law), and the children of the latter become her ʃiuʃtta (sisters-in-law).

A double conclusion can be drawn from this analysis. In the first place, it must be remembered that in systems a and b the term for "older brother or sister" also means parallel cousins. Now we have just established that in the system of group c the parallel cousin can actually be displaced to a younger generation, and that such is the case when the marriage is of the "oblique" type. It may, therefore, be that the oblique marriage has occupied a more important place in systems a and b than is the case today. The second point is that the kinship system of group b, with its use of a special term for the brother or sister of the opposite sex, and its distinction [35] between the parents of spouses and the grandparents, takes an intermediary position

601 582 184 between systems a and c. It constitutes a sort of transition between the simple, symmetrical and harmonious system of the eastern groups and the more subtle and complex structure of the northern system. This role corresponds well to the respective geographic positions occupied by the different groups.

CONCRETE STUDY OF THE GROUPS

601 The concrete functioning of the kinship systems previously analyzed has been studied in the following groups:

I. Eastern group (dialects a).

621 (1) Dialect a 1. —A group of 23 individuals composed of six men, nine women, and eight children. This group was found to be temporarily enlarged by the meeting, and sometimes even the temporary combining of bands, whose members present among themselves, and as concerns the first group, analogous kinship relationships. Thus, group (1) was found to be temporarily increased to the point of including 75 individuals (20 men, 30 women, and 25 children).

(2) Dialect a2. —Several small units each including 6 to 12 individuals.

II. South-central group (dialect b1).

A stable group of 17 individuals composed of five men, six women and six children, temporarily increased, by the meeting with relatives, to 31 individuals (13 men, 10 women, and 8 children).

III. Western group (dialect b2).

A group of 12 individuals composed of four men, five women, and three children.

IV. Northern group (dialect c).

A stable group of 34 individuals composed of 9 men, 11 women and 14 children.

128 114 The concrete study of the groups will be based on the eastern group a1 (restricted) and on the central group b1 (restricted), the only ones with whom we have lived long enough to set forth a psychosociological analysis.

595 husband and his first wife will also play, while bathing or near the
182 camp fire. She is in no way excluded from the gay life. Moreover,
her slighter participation in relationships of amorous comradeship
is compensated by a greater respectability and a certain authority
over her young companions. It must not be forgotten (and we have
595 pointed it out in the study of the kinship system) that the polygamous
● 582 marriage presents a double aspect—the marriage of a man with a
woman and with some "daughters" of the latter, or with a woman
and the "sisters" of the latter. The respective situations of A1, a2
and a3 and a4 realize the two situations at the same time since, at
least in one of the cases (with a4), it is the second oblique marriage
within the same line. As example of the first type, we have the
marriages of A32 and of A56; for the second type, one can also refer
to the marriage of C20 (1).

1. Cf. above, p. 53.

595 The polygamous wives then, as a general rule, belong to a
571 younger generation. The first wife calls them "daughters" or of
"little sisters," and they behave as such. A form of spontaneous
grouping which one finds realized frequently is the union of the hus-
band's daughters (by his first wife) and his young wives (polygamous).
They form a sort of gay and carefree childlike society, but also a
more or less subordinate society. We have found households com-
prised of two (A42, A57, A73, B1, B32, C20), three (A1,) and five
(A32) wives. It does not seem that the number of wives is propor-
tional to the social importance of the husband (even though polygamous
union itself is conditioned by this), but is rather haphazard.

SEX LIFE

000 We shall begin by giving some information concerning organic
activities.

514 Coughing, sneezing, spitting, blowing the nose, belching, ex-
515 pelling flatus, constitute operations which are not subject to any
576 etiquette, and which the vocabulary does not always clearly dis-
tinguish (thus: tolitige, b1, to cough, and tolitiore, b2, to sneeze;
kaite, sneeze, and kaitpe, c, spit. tamikititu, a1, to expel flatus or to
defecate). All of these needs are satisfied publicly, without precaution,
ritual gesture or formula, as much on the part of the executor as on that
of the spectators. No attention is paid to them, and everything

838 Because of the fact of partial polygamy which reigns within
[595 the group, and which is manifested in the fact that the youngest
582 and prettiest women are periodically withdrawn by the chief or
605 the shaman from the regular cycle of marriage, the young men often find themselves in difficulty as regards marriage, at least during part of their adolescence, no potential wife being available. This problem is resolved by homosexual relationships, which the Nambikwara language (b1) has named poetically: tamindige kihãdige, that is false love. These relationships are frequent among young people and are carried on much more publicly than normal relations. The couples do not retire to the bush as the adults usually do. They install themselves near a fire of the camp under the amused eyes of the neighbors. The incident gives rise to some joking comments, usually not carried very far. These relations are considered infantile, and hardly any attention is paid them. The question remains unanswered for us as to whether these practices are carried on to complete satisfaction, or are limited to sentimental effusions, accompanied by erotic play such as those which characterizes, for the most part, relations between husband and wife. Whatever the case may be, the essential point here is that homosexual relations are exclusively relations between cross cousins. Whenever one seeks information from an Indian concerning a relationship of the type just described, the typical response obtained is:

25. tarutebãdige tamĩndige (b1)
(those are) two brothers-in-law making love.

838 We have not been able to ascertain if these relationships of
605 adolescence continue between adults. It seems hardly probable.
607 But relationships of a very special nature are maintained between "brothers-in-law. They exhibit great familiarity toward one another, have among themselves effusions such as we have never noted among brothers or relatives of another degree. Among the
[201] Nambikwara (always prodigious, of course, with affectionate gestures) it is not rare to see two or three men, married and fathers of families, walking in the evening tenderly embracing. The information obtained is, here too, always the same:

26. tarũte ialhaĩete. (b1)
The brothers-in-law are embracing.

607 Certain games, like the "the game of claws (griffes)"
524 (kairobĩtunubi, c) are frequent among brothers-in-law.

621 instead that all the Sabané men were for them tarûte, or that all
605 the Tarundé men were jôpa. As a general rule they did not take the trouble to formulate relationships between women, between children, or between adults and children. In all these cases, except several occasions when the deduction was specifically made, they gave as an answer the name of the group: it is called "Sabané" or "Tarundé." It is thus in the function of the relationship of tarûte or jôpa (asûkosu, al) that the system has been conceived and applied.

This fact merits attention, for if the goal of the system were only to assure intermarriages, one could proceed in two other ways, or, more exactly, give two other interpretations for the same solution; one consisting of posing all the women as "sisters-in-law," the other treating all the men of one group and all the women of the other, respectively, as being among themselves "brothers and sisters," and the result would have been the same. Of course, these two aspects are implied in the proposed solution, as its correlaries. However, the solution itself, which could be presented in three different and equivalent ways, has actually been thought, in preferential fashion, to be in the function of the relationship existing between the male and allied collaterals. Several suggestions should thus be examined.

601 [79] Of the three possible solutions, two implied taking the women into consideration, one only was purely masculine, and it is that one which has been chosen. One must not be astonished if, as we suppose, the problem posed was a political problem, thus arising from command, exclusively exercised by the men, and not by a normal play of filiation, which seems rather a
● [582] matter of female lineage (1). Although in a simple system of

1. See p. 39.

marriage between cross-cousins, as is the Nambikwara system, the "brothers-in-law among themselves" can be as easily the fathers of the mothers as the fathers of the fathers, this choice gives to the Nambikwara sociology, which to the present time we have had trouble characterizing from this point of view, a decidedly masculine tint, or rather, it bears witness of a tendency in that direction, at the same time that it constitutes the first outline of a social system coming to superimpose itself on the purely family structures to which we have been limited

TN 601 171 The reader will find other indications concerning the assimilation of the brother of the father to a classificatory father in Soares de Souza (4).

4. "Roteiro do Brasil," Revista do Instituto, etc., Vol. XIV, 1851, p. 316-317.

TN 601 582 171 The old authors often describe the marriage of cross-cousins among the Tupi, as well as that of uncle with niece. Here again we shall first refer to Anchieta:

"They do not call daughters of sisters temerico eté, nor are they considered as such; because many Indians, since they have several nieces--and very attractive women they are--do not make use of them; but since brothers have so much power over sisters, they consider that [81] nieces belong to them (the brothers), so that they may consider them as wives and use them ad libitum if they so desire, just as they give their sisters themselves to some men and take them away from others. Taragoaj, a very important Indian of the village of Jaribiatiba, which is in the area of São Vicente, had two wives, and one of them was his niece, daughter of his sister..."(1)

1. Loc. cit., p. 259.

Farther on, the two types of marriage are seen as symmetrical institutions: "...porque os pais lhes dão as filas e os irmãos as irmas." Staden also alludes to the marriage of cousins: "They also offer as a gift their daughters and their sisters." (2) The same type of thing is

2. Hans Staden. The true history of his captivity (ed. Malcolm Letts), London, Vol. II, Ch. 18, p. 146.

found in Soares de Souza, Claude d'Abbeville and many others. With a sharp sociological sense, Anchieta discovers a connection [842] between the marriage with the sister's daughter and the recognition of the man as alone responsible for conception. One remembers that this theory is also shared by the Nambikwara:

"Since they respect the daughters of brothers, they call them daughters, and consider them as such; and thus they consider them inviolate because they have a true relationship, coming from the [842] father, who is the agent; and the mothers are nothing more than

receptacles with respect to the fathers, receptacles in which children are deposited, and for this reason the sons of fathers, if they are born of slaves or captives taken from another tribe, are always free and just as esteemed as the others; and the sons of women, if these sons are begotten by captives, are considered slaves and are sold, and sometimes they kill and eat them, even though they may be their own grandchildren, sons of their daughters, and for this reason also they use the daughters of sisters with no prejudice at intercourse, but there is no obligation or universal custom to consider them as true wives, more than the others, as has been stated above. And for this reason the fathers marry them now to their uncles, brothers of the mothers, if the parties are agreeable, by virtue of the power which they have to deal with them as they wish, something which until now is not done with nephews, sons of brothers, nor even in other relationships which are more distant and which come through the line of the fathers, because among the Indians this is considered very strange." (3)

3. Loc. cit., p. 259-260.

Without doubt the marriage of cross-cousins is widespread throughout the whole of South America. (4) But among the Tupi it

4. Thus Breton, concerning the Caraïb of the Antilles says: "First cousins whom we call sons of the brothers of the father are called brothers, and these brothers of the father are also called fathers; and the children of these brothers do not contract alliances together, but rather with the children of the sisters of their fathers." (Dictionnaire Caraïbe-François, Auxerre, 1665, p. 11.)

was rather avuncular marriage which held the attention of the first travelers. Thus, Léry notes: "As for the uncle, he takes his niece" (as a wife); and Thevet: "From the time they are born, the maternal uncle raises them and retains them for future wives." (5) Magalhães

5. Léry, loc. cit. II, Ch. XVII, p. 85; Thevet, Cosmogonie universelle, p. 932.

de Gandavo expresses himself inexactly, without doubt, but [82] in

T
N
601 the same sense when he writes: "It is their custom to marry the
171 women who are their nieces, daughters of their brothers of their
582 sisters; they regard them as their true and legitimate wives. The fathers of these women cannot refuse them, and no one, except their uncle, can claim to marry them (1)." One can refer also to

1. Pedro de Magalhes de Gandavo, The Histories of Brazil, The Cortes Society, New York, 1922, II, ch. X, p. 89.

2. Nobrega, Cartas do Brazil, 1549-1560, Rio de Janeiro, 1931, p. 148;--Vasconcellos, Chronica da Companhia de Jesu do Estado do Brasil, Lisboa, 1865, I. LXXXII, p. 133; Soares de Souza, Tratado, CLVII, CLII.

T
N
595 As regards polygamy and the distinction, so clear among the
171 Nambikwara, between the first wife devoted to household tasks and the secondary wives, companions of the men and sharing their obligations, it will be remembered that Magalhães de Gandavo alludes to a category of women actually unmarried, but who take part in masculine activity (3).

3. Gandavo, loc. cit., II, Ch. 10, p. 89. One will find other information about the family organization of the ancient Tupi in: A. Métraux, La religion des Tupinamba (Paris, Leroux, 1928), passim; --Lafone Quevedo, "Guarani kinship terms as an index of social organization (American Anthropologist, Vol. 21, 1919), p. 421-440; --P. Kirchhoff, "Die Verwandschaftorganisation der Urwaldstämme Südamerikas (Zeitschrift für Ethnologie, Vol. 53 , 1931, Ch. 15, p. 182).

T
N
607 All of these observations authorize us to trace a parallel between
171 the extension of the relationship of "brother-in-law" among the Nambikwara, and a custom, seemingly very close, of the ancient Tupi. First we quote from Yves d'Evreux: " A party of Frenchmen was dispersed throughout the villages to live there according to the

N
T
607 while (besides the preceding form) the Nambikwara brothers-in-law
171 exchange payment directly in the form of homosexual relationships,
N
[838] which make up for the absence of an available sister.
T
N We may now draw a conclusion. The ancient Tupi were acquainted
171 with two types of preferential marriage: the marriage of cross-
582 cousins, and avuncular marriage. The first appeared normally in
607 the form of an exchange of sisters between two cross-cousins; the
601 second resulted from a privilege over the daughter of the sister exercised by the mother's brother, or conceded to the latter by the sister's husband. In the two cases, the marriage is based on a pact between cross-cousins, brothers-in-law in right or in fact—which is the definition which we have retained for the Nambikwara terms tarũte or jõpa. Moreover, this relationship of "brother-in-law" can be established under the name of chetouasap (Yves d'Evreux) or coton-assap (Léry) between individuals which no bond of kinship united before, or relatives of a different or more distant type, and even between strangers (as was the case between French and Indians). The goal was to make possible intermarriage and to amalgamate families or groups, until that time heterogeneous, into a new social unit. One recognizes the procedure which we have described in connection with the fusion of the Sabané and Tarundé (1) groups.

N
171
601

1. The South American practice of utilizing kinship relationships to translate and establish social ties is attested by Von den Steinen (Unter der Naturvölkern Zentral Brasiliens, 2 Aufl. Berlin, 1897, p. 286), whom the Bakairi had decided to call "older brother" and the Mehinaku "maternal uncle." We have just established the equality of the terms "brother-in-law" and "maternal uncle" in a system of marriage between cousins (cross-) joined to the avuncular marriage. As to the use of the term "elder brother," this calls for two observations. In the first place, the kinship system of the Bororo, who are not far distant from the Xingu, modifies each generation in two stages of which the one (elder) is assimilated to the younger members of the former generation and the other (younger) to the older members of the next generation. In such a system, an "elder brother" might be, in fact, a real uncle and a potential brother-in-law. The second point brings to a focus the logical difference between

622 named chief. One single point is clear: his functions are not hereditary. When the acting chief falls ill or becomes too old to carry on his charge, he points out from among the members of the group the one who will be his successor, doubtless influenced in his choice by collective opinion. He makes the decision public by the formula: hẽi ũilikãde (b1): "this one will be chief," and thus the continuity of power is assured:

34. ũilikaa dõrerige tiahĩlikĩherage nlaure ũilikãde (b1)
When the chief dies, another chief comes in his place.

[90] But it happens that the person in question caring little for the heavy responsibilities which await him, declines the honor which has just been done him:

35. ũtniane ũntũilikã ĩlikãdnere (b1)
I do not wish to take the place of the chief.

and it is necessary to proceed to a new choice. What are then the motives which might determine the acceptance? Sexual preoccupations certainly play a role. If the newly elected is young, in place of going through a long period of celibacy or of being forced to marry an old woman, he will find himself in the privileged position of having several companions. If he is already married, he can add to his wife the youngest and prettiest among the available women of the group, or among those who will be conquered in war, and eventually obtain those whom he would desire and who would be already married.

C20, having lost his wives through illness or for some other reason, found himself a bachelor. He then took his young wife (c21) [502] from another husband, under the pretext that the latter was "too young to have a wife." Undoubtedly his liking of responsibility must equally be taken into consideration, his sense of leadership, ambition, and his desire for a fuller existence than that of normal life. The only two chiefs with whom we had any real personal contacts (A1 and B1) were both individuals of particularly lively spirit and, in giving to the term the sense which it might possess in these societies, more cultivated than their companions. (1)

1. The Indian theory of command has been the object of a more detailed study: C. Lévi-Strauss, Chief and chieftainship among a primitive tribe: The Nambikwara of Northwestern Matto Grosso. Transactions of the New-York Academy of Sciences, 1944.

854 From this time on, the life of the Nambikwara infant goes on as we have described, and without there being much differentiation according to sex. These differences begin to appear only at the ap-
881 proach of puberty. At this time, the girls adopt a completely new behavior. They allow themselves great liberties, speaking brutally to their entourage and [109] amusing themselves with obscene acts. The fact is that the ceremony of puberty, which coincides with mar-
[553] riage, marks a decided change in her life and it is also upon that occasion that she receives her name. The Nambikwara women marry
582 very soon after their first menstruation. The polygamy of the chiefs
[595] creates a permanent deficit of women, and the newly available wife is impatiently awaited. According to our informants, it is the young
584 girl who indicates to her parents which of her potential husbands she wishes to marry. She says that she "wishes to marry quickly" (ikĩndurige, b1); the term of dialect a1 for "to marry" being ouensaikititu, literally: "to make a husband," it seems that, as has been affirmed, the initiative belongs to the girl:

48. inka (ni) duredniẽn — durẽnie (b1)
"I wish to marry quickly" [says the girl]. "Marry," says the mother] (?)

Actually, it seems that the marriage is decided from infancy by an agreement between the parents. Farseeing parents must prepare far in advance the marriage of their son, for otherwise the latter risks not finding an available woman. Brothers-in-law have often indicated to us that their children were promised to one another.

881 At the time of puberty, the young girl is completely isolated for a period of from two to four months. She lives in a specially constructed shelter some distance from the village, and lives there alone, observing a series of alimentary and social taboos. During this period, her mother feeds her and takes care of her. The period of segration ended, songs and dances take place. Her shelter is torn down and "the mother takes back her child." Then the ceremony proper of marriage takes place. It is prepared by hunting and fishing, expeditions and is carried out amidst chants and dances:

49. ãrige aĩsũngnerage denano inŝira ãikira ãiknira taãta halonoo tatlĩkta ãindage hntimbãta ũrrige imãgãra imãgãra (b1)
Go get fish, the women arrive, arrive, to broil [the fish] in the square go out, sing, whistle, play the flute, play the flute.

[581] Dutemõdednige (b1), say the Nambikwara men; "it is a good
582 thing to marry." But it is not easy. The ideal marriage is the one which gives a "young and pretty woman" (monodunũere, b1) whose virginity one will have (to break the hymen: tauorõtige, b1). But such women are precisely the ones who are claimed by the chiefs or shamans, and only a few young men will have a chance to obtain such wives. The others are condemned to a long period of celibacy
[838] which they will break by having sexual relations with their brothers-in-law, or else they will marry an "old woman" who cannot have sexual relations (tiroanebiĩ̂ere, b1), one who is widowed or repudiated, whom no one wants. Such marriages are not rare among the Nambikwara, and are explained by the fundamental economic role of the couple which we have already commented on. But they are not permanent. When the young man feels his position in the group
582 strengthened, or when a better occasion is presented he abandons
586 (amnjõtige, b1) his old wife to take another (ulamtunjõtige, b1) who
587 is younger and more seductive. It happens that a man thus marries three or four wives successively before considering himself satisfied. (1)

[71]

1. Here also, the documents of the 16th century relating to the Tupi support the comparison: ".... at times they take some old woman from whom they do not expect children, because there are no others, only so that they will cook the food, since they have no mother or sisters-in-law to take care of them, thus they are cared for, and are contented at present time with some old woman by whom they are always well treated and then taking other women by whom they have children later, either leaving the first wife or keeping her, if she wishes, for the reason mentioned above." (Anchieta, loc.cit., p. 260-261).

The repudiated woman [111] goes to live with her parents if they are still living, joins up with another man if she has the opportunity or even remains her former husband's fire, whose existence she shares and whose tasks she participates in, but in a slightly inferior position. Such is the position of b3 in the household of her ex-husband B1. Another method of obtaining the young woman desired consists of
336 seducing her, even if she is married. Adultery and more generally sentimental intrigues are very frequent among the Nambikwara,

2: Lévi-Strauss E-5 (1938-1939) 1948
SP17 Nambicuara SP17

string (secondary release). Four types ot arrows are used: (1) featherless fishing arrow with three to five prongs; (2) bird arrow with a blunt point; (3) big-game arrow with a lanceolate bamboo point; and (4) poisoned arrow, used chiefly for hunting monkeys, with several barbs which are attached to the point with cotton wrapping and which break easily in the wound, being, therefore, usually protected by a bamboo sheath. The last three have a bamboo shaft and "Arara" feathering. Sewed feathering is known by the central and northern groups but seldom used. For warfare, big game arrows with serrated bamboo points are used.

Nambicuara arrow poison is a curare prepared by grating the root of a *Strychnos* shrub, and by infusing (*Eastern Nambicuara*) or boiling (*Central* and *Northern Nambicuara*) it until the water evaporates and leaves a thick brownish substance, which is smeared on a wax-coated arrow point. It can be preserved in tiny pots for several months. Among South American arrow poisons, it is remarkable because it is made of only one vegetable substance and is prepared openly—in some groups by the chief or shaman, in other groups by anyone—without magical practices or taboos. Its great toxic properties were studied by Vellard (1939 b).

Other poisons of unknown composition are used for amorous or political revenge. They are in the form of powders and are kept in tubes made of feather quills, bamboo, or other woods, each ornamented with paintings and cotton or bark wrappings.

Clubs are carved in the shape of a flattened or cylindrical pointed spade; the handle is often adorned with black and white plaiting of philodendron bark and bamboo strips. Their purpose is mostly ceremonial.

SOCIAL AND POLITICAL ORGANIZATION

Kinship terms identify parallel-cousins with siblings, and cross-cousins with potential or actual spouses. Cross-uncles and cross-aunts are called by the same terms as parents-in-law and grandparents; parallel-uncles and parallel-aunts are equated with parents. Similarly, parallel-nephews and parallel-nieces are classed with children, and cross-nephews and cross-nieces with children-in-law. Marriage is between cross-cousins or between the maternal uncle and his niece. Monogamy is the rule, but polygyny is the privilege of the chief and other important men. Polygyny is usually with several sisters (sororal) or with a woman and her daughters by a former union. The first wife runs the household, subsequent wives being assistants to the husband. The deficiency of available women which results from polygyny is compensated by homosexuality between adolescent male cross-cousins (Lévi-Strauss, 1943 a).

The village is ruled by a chief, but each of the nomadic bands into which it splits during the dry season is led by a secondary chief. Chief-

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

621 people are seldom met together, the average size of the bands being twenty individuals, women and children included. This demographic collapse cannot possibly have taken place without affecting the structure of the band. But here, too, we do not need to concern ourselves 121 with such questions as the type of political organization in earlier times. It is probably more difficult to understand Nambikuara sociology now than it was thirty years ago. Perhaps, on the contrary, the much reduced Nambikuara band offers, better than in the past, a privileged field for a study in social anthropology. My contention is that, precisely on account of its extreme impoverishment, Nambikuara political structure lays bare some basic functions which may remain hidden in more complex and elaborate systems of government.

[361] Each year, at the end of the rainy season, that is, in April or in early May, the semi-permanent dwellings laid in the vicinity of the 621 gallery-forest where the gardens are cleared and tilled, are abandoned and the population splits into several bands formed on a free choice basis. Each band includes from two to about ten families usually tied by kinship. This may be misleading when a band is met, for one easily gets the impression that it is formed as an extensive family. It 601 does not take long to discover, however, that the kinship tie between [602] two families belonging to separate bands may be as close, and eventually closer, than between two families inside the same band. The [582] Nambikuara have a simple kinship system based on cross-cousin marriage and the subsequent dichotomy between "cross" and "parallel" in every generation. Therefore, all the men in one generation are either "brothers" or "brothers-in-law," and men and women are to one another either siblings (true or classificatory) or spouses (true or classificatory). Similarly, children are, in relation to the adults, either sons and daughters (true or classificatory) or nephews and nieces, which is the same as actual or potential children-in-law.[3] As a result, there is no great choice of terms to express kinship, and this explains why kinship inside the band may appear closer than it actually is, and kinship between people belonging to different bands more remote than shown 602 by genealogies. Furthermore, a bilateral cross-cousin marriage system functioning in a relatively small tribe must produce a progressive 621 narrowing, and even a multiplication, of the kinship ties between any two individuals. This is a supplementary reason preventing family

4: Oberg E-5 (1949)1953
SP17 Nambicuara SP17

619 to grow manioc and sweetpotatoes. He also gave them
773 the flute (*wáinhu*), and taught them how to sing and dance. *Oklihdítisu* is thus the culture hero of the Nambicuara. In human form he looks like a Nambicuara Indian, wears ornaments in his ears, nose, and upper lip and paints himself with urucú. Yet today people no longer see *oklihdítisu*, for he has gone away. They do not have rituals connected with him, nor do the shamans solicit his aid. But the stone mountain from which the Nambicuara came is still recognized as the place of the dead. On ceremonial occasions the ghosts of the ancestors come to the encampments and villages from the mountain, returning after they have been given food.

622 Although every band has a leader or chief it is not quite certain whether these leaders get their positions through succession or by personal strength and prestige. Julio claimed that he is headman because his father was a headman, but the other members of the Waklítisu band claim that the strongest man is always the leader by common agreement. The Nambicuara appear to value two qualities in a man—"a strong body" and "a strong mouth." The chief is like a tapir (*alúnsu*) which is the strongest of the animals; thus, a chief is called *alunsdídnara*. A shaman gains power by talking or by having "a strong mouth," as the Nambicuara say. The strongest man is one who combines these qualities and is at once a strong man and shaman—he becomes an important chief.

The survival of the band, the Nambicuara believe, depends upon the *alunsdídnara*. He is the hunt leader, the head farmer, the one who organizes trade between the bands, the ceremonial head, the war leader, and the settler of disputes. Every successful chief is supposed to have four wives but otherwise has nothing to distinguish him from the rest of the tribesmen.

619 Relationships between the bands of the Eastern Nambicuara are characterized by intermarriage, trade, occasional joint ceremonies, and wife stealing and consequent armed conflicts. Inter-
● [582] marriage occurs when cross cousins are not available for marriage within the band. The Chiwáisu
438 and Hégndisu obtain pots from the Western
619 Nambicuara in exchange for wax, feather ornaments, beads, and bows and arrows. These pots they in turn exchange with the Eastern Nambicuara bands for knives, axes, and tin cans.

When one band wants to meet another in order to exchange goods the approach is made in a very formal manner. The approaching band stops

[p. 96 (B)]

621 Elótasu band. This is the custom among all the Eastern Nambicuara bands.

601 The kinship terminology belongs to the bifurcate merging type. The term *taydntasu* (grandfather) and the term *quatahdinisu* (grandmother) are extended to the brothers and sisters of one's grandparents. The term *awinisu* (father) and the term *ahakinisu* (mother) are extended to father's brother and mother's sister, respectively. Father's sister is termed *ahainusu* and mother's brother *asúnusu*. A man calls his older brother *akandnusu*, his younger brother *dawdidnisu*, and his sisters *awddnasu*, these terms being extended to parallel cousins. The terms for son (*akirdru*) and daughter (*akenéru*) are extended to the children of a man whom ego calls brother. The terms for sister's son and daughter are *asuétu* and *asintu*, respectively, these terms being extended to the children of anyone whom ego calls sister. The term for male cross cousin is *asúkisu* and that for female cross cousin, *dazéru*. There is just one term for grandchildren, *quatasdiserawa*.

The only affinal kinship terms which we could obtain were the terms wife (*azisu*) which bears a close relationship to female cross cousin; husband (*amezdisu*); and the terms for father-in-law (*asúnusu*), and mother-in-law (*ahainusu*), which are identical to the terms for mother's brother and father's sister. Whether women employ different kinship terms was not ascertained owing to the fact that the women refused to discuss the matter and the male informants persisted in going to sleep when the subject was broached.

582 The kinship terminology supports the statement made by the Nambicuara that cross-cousin marriage is preferred. Excepting one Elótasu woman all the wives in Julio's band were Waklítisu and cross cousins of their husbands. At the death of
587 the husband the wife and children pass to the
768 deceased husband's brother. Women sometimes marry their mother's brothers. Residence is patri-
591 local although when marrying a woman from another band, the man sometimes remains with his wife's band for a while. Band membership, as has been stated, is determined by matrilineal descent.

622 The powers of the chief are limited to leadership in such activities as hunting, planting, trade, and ceremonies. Raids, although organized by the chief, are not led by him. The chief admon-

baked manioc and other food which they have been preparing. When the messenger leaves with the food it is a sign that the men will return to camp after sunset.

Before the men arrive the women wash the girl and paint her with a mixture which includes latex from the rubber tree. A series of dots are painted on her face, breasts, abdomen, and thighs (pl. 6, *c* and *d*). When the men come in they dance in front of the girl's hut. She then comes out and is given a name and everyone tries to give her a necklace or some other object. During the night men and women join in the dance, holding hands and dancing in a circle, the dance steps being stamped out with the right foot in the direction in which the circle is moving. A special puberty song is also sung.

The Nambicuara tell of a strange medicine known only to the shamans which is given to girls during the puberty ceremony. It is a blue liquid which, when taken internally, stops menstrual bleeding for the remainder of the girl's life. The Waklĭtisu claim that they do not use it but that the other Eastern Nambicuara band do. The missionaries informed me that the Kitânrhu use this medicine, and the missionaries seemed to think that it was effective.

MARRIAGE

There is no special marriage ceremony, for when young people go through the puberty rites they are ready for marriage and a mate is selected for them by their parents. The young man, who is to become the husband of a girl just out of seclusion, goes to her parents and helps his future father-in-law build a small hut, and when it is finished the young man tells the girl to come out hunting with him. She takes a burden basket and they go off into the woods. In the afternoon the man builds a fire and tells the girl to prepare some food and honey. After the food has been eaten he tells the girl to come and lie beside him near the fire. She is supposed to resist and he takes a stick and threatens her. He then has sexual intercourse with her, and when they come back to camp that night they are accepted as a married couple. When wives are acquired by inheriting the widow of a brother or by abduction from other bands, no ceremony is held.

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

571 607 A more fundamental problem raised by the union of the two groups, namely the nature of the relations to be established between their respective members, was solved by the common statement that all the male members of the Sabáne group were to be acknowledged as the "brothers-in-law" (*tarúlę*) of the male adults of the Tarúnde group, and, conversely, that the latter were to be acknowledged as "brothers-in-law" (*iópą*) by the former. Consequently, all the "wives" belonging to one group became the "sisters" of the "husbands" of the other, and the "sisters-in-law" of the latters' wives; and all children of both sexes in one group became the potential spouses of the children in the other. As a result, these two groups will be welded into a single consanguineous unit within two generations.

The conscious and systematic nature of this solution cannot be doubted. When asked for their kinship relation to any male adult of the allied group, the male informants, irrespective of the group to which they themselves belonged, never gave a different answer, but always emphasized that the question was meaningless since all the Sabáne men were their *tarúlę*, or all Tarúnde men their *iópą*. On the other hand, no one seemed to have a clear idea of the exact relationship between the women, the children, or the adults and the children of the two groups. Occasionally the correct theoretical relationship could be deduced; more frequently only the group name was given in reply to our queries: She is calling the other one "Sabáne"—or "Tarúnde." Thus it may be assumed that the system was conceived of and applied according to (and exclusively according to) the *tarúlę* (or *iópą*) relationship. This inference is rather important because, of course, the same result could have been achieved by other means.

If the sole aim of the system had been to ensure inter-marriage, it could have been brought about equally well in two other ways; perhaps we should say that two different interpretations might have been made of the same phenomenon. In the first place, the women might have been regarded as "sisters-in-law"; or, in the second place, all the men of one group and all the women of the other might have entered a brother-sister relationship. In both cases the result would have been the same as in the accepted interpretation, in which, indeed, these relationships are implied though not expressed. Nevertheless, the solution itself was actually based on the relationship between the male and his allied collaterals, the consequences of which must now be examined.

571 607 583 Two of the three possible interpretations implied the consideration of women; only one was purely masculine, and it is the latter which was adopted by the natives. The reason for the choice is obvious since the problem to be solved was a purely political one, concerning the chieftainship, which is exercised by men, rather than the normal mechanism of filiation, the pattern of which seems to be matrilineal. In a simple system of cross cousin marriage, such as that of the Nambikuara, the brother-in-law may be either the matri-

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

lateral or the patrilateral cross cousin; nevertheless, the chosen interpretation stresses the male side in Nambikuara society, or, let us say, it shows a strong tendency in this direction. At the same time we can see in such a solution a specifically social structure beginning to superimpose itself on the formerly simple familial units.

We do not intend in any way to base a theory of the origin of dual organizations on these restricted observations, the character of which is mainly anecdotal. However, this is a case where "the characteristic features of the sib organization are in some measure prefigured among sibless tribes";[1] as a matter of fact, in order to fulfil the main requirements of a system of exogamic moieties, it would be sufficient for the new unit, once fixed, to retain the recollection of its dual origin by preserving the habit of not mingling the camp fires.

Moreover, the extension of the "brother-in-law" relationship provides an instance of the increasingly superior position of the men within the group, since it is through the men that group alliances are brought about, just as wars are waged by men.

The preceding observations have a further value, since with their help we may be able to interpret sociological information found in the older literature on South America, especially that dealing with the Tupi of the Brazilian coast.

There are striking similarities between several features of the Nambikuara kinship system and what may be inferred about the ancient familial organization of the coastal Tupi. When describing small details of Nambikuara daily life, one is often tempted to quote Jean de Léry or Yves d'Evreux, so accurately do their words apply to certain live features of Nambikuara society, notwithstanding the fact that they were written four centuries before this culture became known. As a matter of fact, several metaphysical themes are common to both cultures and, indeed, certain names in the Nambikuara religious vocabulary have a conspicuously Tupi origin. The most important similarities, however, are those involving the kinship systems. In both cultures the same three principles of familial organization are stressed and are apparently similarly expressed: First the dichotomy of the parents' brothers and sisters between parallel uncles and aunts, called "fathers" and "mothers," and cross uncles and aunts, called "fathers-in-law" and "mothers-in-law;" secondly, the marriage of cross cousins with the correlative assimilation of parallel cousins to "brothers" and "sisters"; and, finally, the avuncular marriage, which, among the ancient Tupi, seems to have taken the form of a preferential union between the mother's brother and the sister's daughter.

An excellent text by Anchieta gives evidence of the occurrence of the first principle, as well as showing signs of the existence of the other two:

[1] Robert H. Lowie, *Family and Sib* (American Anthropologist, Vol. 21), p. 28.

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

595
171

Regarding polygyny and the sharp differentiation made among the Nambikuara between the first wife who devotes herself to feminine activities and the younger wives who are their husband's companions and share his tasks, it may be recalled that Magalhaes de Gandavo[17] refers to a special category of women, single indeed, who shared in masculine activities.[18]

171
114

The preceding similarities may perhaps allow us to establish a valid comparison between our observations concerning the extension of the "brother-in law" relationship among the Nambikuara and what seems to have been a very similar institution among the ancient Tupi. We first quote Yves d'Evreux:

> They scattered part of the French through the villages so that they might live according to the custom of the land, which consists in having *cheiouasap*, that is to say, hosts or god-sibs (*compères*), giving them merchandise instead of money. Such hospitality or god-sib relationship is very close among them, for they regard you as their child as long as you stay with them. They hunt and fish for you and, what is more, they used to give their daughters to their god-sibs (*compères*).[19]

The same author refers later to the "French who were established in the villages in a god-sib relationship (*compérage*)."[20] Evidence of the aboriginal institution may also be found in Jean de Léry:

> It is worth remarking that the words *atour-assap* and *coton-assap* differ, because the first signifies a perfect alliance between them and between them and us, so much so that the belongings of the one are common to the other. And also that they cannot have the daughter or sister of the first named.[21]

From this one may infer, conversely, that marriage is authorized with the sister and the daughter of the *coton-assap*. Therefore, the *coton-assap* is granted a double privilege: first, marriage with his partner's sister, which makes him a "brother-in-law"; and, secondly, marriage with his partner's daughter, which is equivalent to his assimilation to the rank of "maternal uncle";—then, because he is considered a theoretical brother of his partner's wife, he also becomes a theoretical brother-in-law. Actually, therefore, both privileges have the same result.

171
607
582

One more similarity between the Tupi and Nambikuara brother-in-law relationship remains to be pointed out. All the texts quoted agree that there existed among the Tupi a kind of authority held by young men over their

sisters. Cross cousin marriages seem to have resulted chiefly from a reciprocal exchange of their respective sisters by the male cross cousins. (The same holds for the giving of a daughter by a father.) The potential or actual brothers-in-law then enter into a relationship of a special nature based upon reciprocal sexual services. We know that the same thing may be said of the Nambikuara brothers-in-law, with the difference that, among the Tupi, the sisters or daughters of the brothers-in-law provided the object of these services, whereas among the Nambikuara the prestations are directly exchanged in the form of homosexual relations.

We may now summarize our observations. The ancient Tupi acknowledged two forms of marriage; namely, cross cousin marriage and avuncular marriage. The first was usually practised in the form of an exchange of sisters by two male cousins; the second appears to have been a right to the sister's daughter exercised by the mother's brother or granted to him by his sister's husband. In both cases the marriage is the result of an agreement between cross cousins, actually or potentially brothers-in-law—which is the definition we retained as a suitable translation of the Nambikuara terms *tarášę* and *iópę*. Now, this special "brother-in-law" relationship could be established, under the name of *chetowasap* (Evreux) or *coton-assap* (Léry), between individuals not united previously by any kinship tie, or else only more remotely related, or even between strangers (as was the case of the French and the Indians). The reason for such a step was to ensure intermarriage and by this means to amalgamate familial or social groups, previously heterogeneous, into a new homogeneous unit. One recognises here the same process described in the analysis of the relations between the newly joined groups, Sabáne and Tarúndę.[28]

[28] The widespread South American custom of using kinship terms to express social relationships is attested to by Von den Steinen (*Unter der Naturvölkern Zentral Brasiliens*, 2 Aufl. Berlin, 1897, p. 286), who was called "elder brother" by the Bakairi and "maternal uncle" by the Mehinaku. We have just established the equivalence of the terms "maternal uncle" and "brother-in-law" in a system of cross cousin marriage combined with avuncular marriage. Regarding the use of the term "elder brother," two observations should be made. First, in a kinship system such as that of the Bororo, not far distant from the Xingu, each generation is to some extent split into two layers, the elder half being assimilated to the younger half of the generation above and the younger half to the elder half of the generation below. In such a system an "elder brother" may well be a true uncle and a potential brother-in-law.

The use of the term "brother" for social purposes may also be understood in another way. Among the Nambikwara, there is a special term, sometimes used to designate a sibling of the same sex, the meaning of which is "the other one." This term is applied not only to describe a familial relationship, but is also used to name objects belonging to a class which includes several units (for instance, the pests of the huts or the pipes of the whistles). Friendly groups may also consider themselves to be "brothers" and the exclamation, "You are no more my brother!" may often be heard in discussions between angry adversaries.

This suggests that the term "brother" possesses, in addition to its kinship significance, a very wide meaning, both logical and moral. Nevertheless, when the technical problem of establishing new social relationships is put up to the Indians, it is not the vague "brotherhood" which is called upon, but the more complex mechanism of the "brother-in-law" relationship.

[500] sionaries had not yet learned enough Iranxe to make working with missionaries possible.

621 As all of the following information, unless otherwise specified, relates to the Wakitisu band, a
622 short description of this band is in order. Today the band consists of 18 individuals, of which Julio
[731] is the chief. About 5 years ago, before a measles epidemic decimated it, the band was roughly twice the size it is today. Julio is a man of middle age, has three wives and two children, and probably holds his leadership by being the strongest and ablest man in the band. Except for one of Julio's wives and her daughter who are Elótasu, the members of the band are Wakitisu and
[595 related to one another. Julio took the Elótasu
583] woman from the Elótasu band by killing her husband. He claims he did this because the Elótasu chief stole one of his wives some years ago. He claims he is going to steal another wife, for every chief is supposed to have four. Only three other men, Martin, Marciano, and Joaquin, are married, each having one wife. The remaining four are either widowers or as yet unmarried.

164 Of all the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were the most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covered with some kind of scaly skin disease from head to foot, and another was deaf and dumb. The women and children, however, appeared to be
515 healthy. Owing to the fact that they use no
[573] hammocks but sleep on the ground, they are always covered with dirt. On cold nights they remove the fires and sleep in the warm ashes.
[291] The Wakitisu wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat,
[164] makes proximity to them rather distasteful. They also appear to be heavily infected with internal parasites, for their stomaches are distended and they are continually passing wind. On several occasions when a number of them had crowded into the small room we used for working we had to cease work in order to air the room.

181 In their manners the Nambicuara also contrast
171 sharply with the other tribes I visited. The

619 several hundred yards off and messengers are sent
438 out to arrange a meeting. When agreement is reached the visiting band enters the camp, the visiting chief kneels on one knee and holding his bow and arrows above his head with his right hand he makes a speech extolling the hosts and their goods and depreciating the things which his band has brought. The host then makes a similar speech, and trading begins.

Important items are traded by the two chiefs representing their respective bands, while small items can be exchanged by individual owners. In all cases, however, the technique of trading is the same. If an individual wants an object he extolls it by saying how fine it is. If a man values an object and wants much in exchange for it, instead of saying that it is very valuable he says that it is no good, thus showing his desire to keep it. "This ax is no good, it is very old, it is very dull," he will say, referring to his ax which the other wants. This argument is carried on in an angry tone of voice until a settlement is reached. When agreement has been reached each snatches the object out of the other's hand. If a man has bartered a necklace, instead of taking it off and handing it over, the other person must take if off with a show of force. Disputes, often leading to fights, occur when one party is a little premature and snatches the object before the other has finished arguing. The term "boca forte" (strong mouth) applies particularly to trading, for a man with a strong mouth gets what he wants and convinces the other that he, too, has made a good bargain. This method of trading contrasts sharply with that practiced among the Upper Xingú tribes where each party places a pile of goods opposite the article he wants, usually without saying a word. If agreement is not reached, each one eventually withdraws his goods.

GM After a satisfactory exchange of goods the two
• 583 bands go hunting and prepare a quantity of food and dance as long as the food lasts. During these meetings marriages are sometimes arranged, but more often, when leaving, some strong man will try to steal the wife of some other man. If a fight should occur in which one man is killed the winner will take not only his wife or wives but his children and property as well.

619 Rev. L. W. Buckman gave the following account which reveals something of the tension between

[p.97(A)]

857 From this time on, the life of the Nambikwara infant goes on as we have described, and without there being much differentiation according to sex. These differences begin to appear only at the ap-
881 proach of puberty. At this time, the girls adopt a completely new behavior. They allow themselves great liberties, speaking brutally to their entourage and [109] amusing themselves with obscene acts. The fact is that the ceremony of puberty, which coincides with mar-
[553] riage, marks a decided change in her life and it is also upon that occasion that she receives her name. The Nambikwara women marry
582 very soon after their first menstruation. The polygamy of the chiefs
[595] creates a permanent deficit of women, and the newly available wife is impatiently awaited. According to our informants, it is the young
584 girl who indicates to her parents which of her potential husbands she wishes to marry. She says that she "wishes to marry quickly" (ikĩndurige, b1); the term of dialect a1 for "to marry" being oyensaikititu, literally: "to make a husband," it seems that, as has been affirmed, the initiative belongs to the girl:

48. inka (ni) duredniẽn durẽnie (b1)
"I wish to marry quickly" [says the girl]. "Marry," says the mother] (?)

Actually, it seems that the marriage is decided from infancy by an agreement between the parents. Farseeing parents must prepare far in advance the marriage of their son, for otherwise the latter risks not finding an available woman. Brothers-in-law have often indicated to us that their children were promised to one another.

881 At the time of puberty, the young girl is completely isolated for a period of from two to four months. She lives in a specially constructed shelter some distance from the village, and lives there alone, observing a series of alimentary and social taboos. During this period, her mother feeds her and takes care of her. The period of segration ended, songs and dances take place. Her shelter is torn down and "the mother takes back her child." Then the ceremony proper of marriage takes place. It is prepared by hunting and fishing expeditions and is carried out amidst chants and dances:

49. ũrige ãĩũngnerage denano inĩra ãĩkira ãĩknira tããta halonoo tatlĩkta ãĩndage hntimbãta ũrrige imãgãra imãgãra (b1)
Go get fish, the women arrive, arrive, to broil [the fish] in the square go out, sing, whistle, play the flute, play the flute.

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

tainship is not hereditary; the chief, when old or sick, designates his successor from the ablest men of the group. The chief's authority is slight; it depends wholly on the good will of the family heads. 622

Relations between neighboring bands are inspired both by fear and by the desire to exchange goods. Warfare, therefore, is closely connected with barter. Groups not acquainted with each other use ritual speech when they meet. 619 438

Before starting a war expedition, a divinatory rite is performed with special songs and dances. An arrow is hidden by the shaman, the outcome of the expedition being pressaged by its appearance the following day. 721 787

LIFE CYCLE

Childbirth.—After the delivery of a child, the placenta is buried in the bush and both parents are subjected to rigid prohibitions concerning food, the use of ornaments, and social contacts. 844

Puberty.—The initiation rite for young men consists of piercing their lips and nose and giving them their adult personal name. At her first menstruation, a girl is isolated for several months in a special shelter outside the village, where she is given ritual food by her mother. At the end of the rite, she takes a long bath in the river; this also constitutes the first step of the marriage ceremony. 881 [304]

Both cross-cousin and avuncular marriages (see p. 367), are often planned by parents for their infant children. Marriage is celebrated by festivals, banquets, and dances. The union is pronounced by the chief. Fish and fishing are important both before and during the ceremony. 584 585

Separation is frequent, the chief cause being that the man seeks a younger and prettier woman. There is no social sanction of adultery, except that the seducer is advised by his companion to go away for a while so as to avoid the husband's revenge. A murderer also flees vengeance. 586 684 682

Death.—Some groups of *Nambicuara* bury their dead in a circular pit, the corpse being placed in a crouching position. Others leave the corpse to decompose in an elongated ditch and later wash the bones in the river, put them in a basket, and bury them in the village, which is then abandoned. Weapons, implements, adornments, and other property of the deceased are destroyed, but his garden—if he owned one—is abandoned only for a few months. Later anybody may cultivate it. 764

ESTHETIC AND RECREATIONAL ACTIVITIES

Art.—Most *Nambicuara* groups are completely ignorant of drawing, although some groups decorate calabashes with dots and straight and sinuous lines. These are conventionalized reproductions of realistic designs found among other groups. 531

881 baked manioc and other food which they have been preparing. When the messenger leaves with the food it is a sign that the men will return to camp after sunset.

[302 314] Before the men arrive the women wash the girl and paint her with a mixture which includes latex from the rubber tree. A series of dots are painted on her face, breasts, abdomen, and thighs (pl. 6, *c* and *d*). When the men come in they dance in front of the girl's hut. She then comes out and is given a name and everyone tries to give her a necklace or some other object. During the night men and women join in the dance, holding hands and dancing in a circle, the dance steps being stamped out with the right foot in the direction in which the circle is moving. A special puberty song is also sung.

881 841 278 The Nambicuara tell of a strange medicine known only to the shamans which is given to girls during the puberty ceremony. It is a blue liquid which, when taken internally, stops menstrual bleeding for the remainder of the girl's life. The Wakítisu claim that they do not use it but that the other Eastern Nambicuara band do. The missionaries informed me that the Kitânrhu use this medicine, and the missionaries seemed to think that it was effective.

MARRIAGE

582 585 There is no special marriage ceremony, for when young people go through the puberty rites they are ready for marriage and a mate is selected for them by their parents. The young man, who 584 is to become the husband of a girl just out of 585 seclusion, goes to her parents and helps his future father-in-law build a small hut, and when it is finished the young man tells the girl to come out hunting with him. She takes a burden basket and they go off into the woods. In the afternoon the man builds a fire and tells the girl to prepare some food and honey. After the food has been eaten he tells the girl to come and lie beside him near the fire. She is supposed to resist and he takes a stick and threatens her. He then has sexual intercourse with her, and when they come back to camp that night they are accepted as a [587] married couple. When wives are acquired by inheriting the widow of a brother or by abduction from other bands, no ceremony is held.

[P. 104 (A)]

● 585 The union of the husband and wife is pronounced by the chief who places in the mouth of each a large piece of fish. (1)

831

1. It has already been suggested (Kunike, "Der Fisch als Fruchtbarkeitssymbol bei den Waldindianern Südamerikas, Anthropos, VII 1912, p. 206-229) that the fish could be a sexual symbol among the South American Indians. Tastevin has vigorously criticized this hypothesis (Le poisson symbole de Fécondité ou de Fertilité chez les Indiens de l'Amérique du Sud, id., IX, 1914, p. 405-417). However, the Nambikwara ritual of marriage seems to confirm the first theory. Moreover, fish is directly treated as the symbol of sexual relations in the legend where Maire-Pochy makes a girl pregnant by [110] making her eat the fish which he himself had fished. As the origin of this Tupi story is certainly Andean (Kunike, loc.cit.; Métraux, p. 12-13; Ehrenreich, Ueber die Verbreitung und Wanderung der Mythen bei den Naturvölkern Südamerikas, Congrès international des Américanistes, Stuttgart, 1904, p. 663) we have there a supplementary piece of information concerning the affinity of the Nambikwara with the cultures of the North and West.

881 [110] There is no puberty ceremony for the boys. This is replaced by a ritual of initiation which takes place toward the ninth or tenth year, apparently. It is composed of two essential operations, [553 304] the giving of a name, and the piercing of the lip and of the nasal septum to place some wood ornaments there. The first operation is done directly by the chief, the second by a companion whom he designates to this effect:

50. uetnoãdige iochãdige uilikade uelikãdeli'kinere nukeaiore judotige iurosenie nikama iurojotige (b1)
When the boy is grown the chief, the chief gives him a name. A companion pierces his lip to put in the ornament. He [the chief] orders the hole [for the ornament] to be made.

He then has sexual intercourse with her, and when they come back to camp that night they are accepted as a married couple. When wives are acquired by inheriting the widow of a brother or by abduction from other bands, no ceremony is held.

542 treated with great affection. The men are jealous of their wives, and
[837] the women take pride in being faithful. In this respect they are quite unlike their neighbors, the Paressi women...

832 The couples are always petting each other, and no caress seems
302 sweeter and more tender to the lover than the woman's fingers running through his hair. This is easy to understand, for the Nambicuara head swarms with vermin...

[Fig. 38]

●585 According to reports of the soldier Gouveia, marriage is a simple ceremony. The man asks the father of his beloved for consent to the union. If the father agrees, he gives the bridegroom a bow and a sheaf of arrows, telling him that with these weapons he must support the family he is about to form. That is all.

851 To show that a boy is the son of a certain man, they use in
201 their innocence an expressive gesture: they join the thumb and index finger of the left hand, in the shape of a ring, around the right extended index finger. Then they tap the child and father on the shoulder, saying "Uétü!" (son).

888 They show great respect for old people and spare them all possible effort. When we returned from the village on the Urutau to the post on the Juina, they had us carry [258] on the bow of our saddles the baskets of two old men from the group that accompanied us in search of gifts. The young men and the women all carried their own atiçú and did not ask for help.

771 As to their religion, we know only that it is fetishistic. We know nothing of its cult or system, and even less of its dogma. [Fig. 33]

821 The northern groups seem to be tending toward astrolatry. Once
[771] when I had threatened the moon and the stars with an arrow, poised ready on a strung bow, several Tagnani rose abruptly and halted my gesture, speaking very excitedly, scolding me, and taking the weapon away from me as if it were a sacrilege.

The Cocozu and Anunze threaten the storm with their weapons, waving their arms in all directions and cursing the rain in loud yells.

Sometimes, instead, the women climb on a termite nest where they let out puffs of smoke and throw ashes into the air to frighten the storm.

764 We do not know anything as yet about their funeral rites. It has been ascertained, however, that they do not cremate their dead and do not eat them. They bury them directly [259] in the ground--
the Cocozu in circular pits, the Tagnani in elongated graves.

[581] Dutemõdednige (b1), say the Nambikwara men; "it is a good
582 thing to marry." But it is not easy. The ideal marriage is the one which gives a "young and pretty woman" (monodunuẽre, b1) whose virginity one will have (to break the hymen: tauorotige, b1). But such women are precisely the ones who are claimed by the chiefs or shamans, and only a few young men will have a chance to obtain such wives. The others are condemned to a long period of celibacy
[838] which they will break by having sexual relations with their brothers-in-law, or else they will marry an "old woman" who cannot have sexual relations (tiroanebiĩere, b1), one who is widowed or repudiated, whom no one wants. Such marriages are not rare among the Nambikwara, and are explained by the fundamental economic role of the couple which we have already commented on. But they are not permanent. When the young man feels his position in the group
582 strengthened, or when a better occasion is presented he abandons
● 586 (amnjotige, b1) his old wife to take another (ulamtunjotige, b1) who
587 is younger and more seductive. It happens that a man thus marries three or four wives successively before considering himself satisfied.(1)

[171]

1. Here also, the documents of the 16th century relating to the Tupi support the comparison: "... at times they take some old woman from whom they do not expect children, because there are no others, only so that they will cook the food, since they have no mother or sisters-in-law to take care of them, thus they are cared for, and are contented at present time with some old woman by whom they are always well treated and then taking other women by whom they have children later, either leaving the first wife or keeping her, if she wishes, for the reason mentioned above." (Anchieta, loc.cit., p. 260-261).

The repudiated woman [111] goes to live with her parents if they are still living, joins up with another man if she has the opportunity or even remains her former husband's fire, whose existence she shares and whose tasks she participates in, but in a slightly inferior position. Such is the position of b3 in the household of her ex-husband B1. Another method of obtaining the young woman desired consists of
836 seducing her, even if she is married. Adultery and more generally sentimental intrigues are very frequent among the Nambikwara,

2: Lévi-Strauss E-5 (1938-1939)1948

619 which cause sickness, they have given the magical herbs whose smoke blinds the dangerous *anúnsu*, and the techniques which will drive away the storms. Thus the shaman operating on a symbolic level continues the struggle for survival which has been defined for the Nambicuara by the nature of their adjustment to their physical environment and their relationships to one another.

THE LIFE CYCLE

BIRTH

833 The Nambicuara recognize sexual intercourse [842] (*winsúenditsu*) as the cause of pregnancy (*haldjítsu*). This act takes place in the woods while the husband and wife are out hunting or collecting, for it is considered improper to have sexual intercourse in public, even at night around the common camp fire. If a shaman should see a couple in 756 sexual embrace while practicing his rites it would 833 spoil his power. Although shamans use a special hut when calling their *anúnsu* there is always a chance that they may see a couple in the sexual act, so every effort must be made to avoid this [834] danger. Shamans themselves abstain from sexual intercourse for 2 or 3 days before getting in contact with the spirits.

843 There appear to be no food taboos surrounding pregnancy among the Waklítisu. The husband continues hunting and collecting as usual, but he must avoid working too hard in the field for fear of causing his wife to abort. Women do [847] not practice abortion, and the Nambicuara did not mention any medicines used for this purpose. [832] Honey is considered conducive to sexual vigor and is used by young couples. Childless marriages [843 586] are attributed to sterility in women, and a man may abandon his wife for this reason.

844 Birth takes place in the house, or in the camp if the family is out hunting. Just before expecting the birth of a child the expectant mother drinks [824] the juice of certain herbs which are believed to facilitate birth. The husband and two older women assist in the delivery. The woman kneels on the ground and is supported by her husband. The umbilical cord is tied with a certain vine and then cut with a bamboo sliver. Among the Kitânrhu it is bitten off by one of the midwives. The placenta is buried at the place of birth and when the umbilical cord dries and falls off, it, too,

[p. 102 (8)]

[581] Dutemõdednige (b1), say the Nambikwara men; "it is a good
582 thing to marry." But it is not easy. The ideal marriage is the one which gives a "young and pretty woman" (monoduinuẽre, b1) whose virginity one will have (to break the hymen: tayorotige, b1). But such women are precisely the ones who are claimed by the chiefs or shamans, and only a few young men will have a chance to obtain such wives. The others are condemned to a long period of celibacy
[838] which they will break by having sexual relations with their brothers-in-law, or else they will marry an "old woman" who cannot have sexual relations (tiroanebiriere, b1), one who is widowed or repudiated, whom no one wants. Such marriages are not rare among the Nambikwara, and are explained by the fundamental economic role of the couple which we have already commented on. But they are not permanent. When the young man feels his position in the group
582 strengthened, or when a better occasion is presented he abandons
586 (amnjotige, b1) his old wife to take another (ulamtunjotige, b1) who
●587 is younger and more seductive. It happens that a man thus marries three or four wives successively before considering himself satisfied.(1)

[71]

1. Here also, the documents of the 16th century relating to the Tupi support the comparison: ".... at times they take some old woman from whom they do not expect children, because there are no others, only so that they will cook the food, since they have no mother or sisters-in-law to take care of them, thus they are cared for, and are contented at present time with some old woman by whom they are always well treated and then taking other women by whom they have children later, either leaving the first wife or keeping her, if she wishes, for the reason mentioned above." (Anchieta, loc.cit., p. 260-261).

The repudiated woman [111] goes to live with her parents if they are still living, joins up with another man if she has the opportunity or even remains her former husband's fire, whose existence she shares and whose tasks she participates in, but in a slightly inferior position. Such is the position of b3 in the household of her ex-husband B1. Another method of obtaining the young woman desired consists of
836 seducing her, even if she is married. Adultery and more generally sentimental intrigues are very frequent among the Nambikwara.

621 Elótasu band. This is the custom among all the Eastern Nambicuara bands.

601 The kinship terminology belongs to the bifurcate merging type. The term *tayántasu* (grandfather) and the term *quatakáinisu* (grandmother) are extended to the brothers and sisters of one's grandparents. The term *awinisu* (father) and the term *ahakinisu* (mother) are extended to father's brother and mother's sister, respectively. Father's sister is termed *ahainusu* and mother's brother *asúnusu*. A man calls his older brother *akandnusu*, his younger brother *dawáidnisu*, and his sisters *awáidnasu*, these terms being extended to parallel cousins. The terms for son (*akirdru*) and daughter (*akenéru*) are extended to the children of a man whom ego calls brother. The terms for sister's son and daughter are *asutitu* and *asintu*, respectively, these terms being extended to the children of anyone whom ego calls sister. The term for male cross cousin is *asúkisu* and that for female cross cousin, *dazisu*. There is just one term for grandchildren, *quatasdiserawa*.

The only affinal kinship terms which we could obtain were the terms wife (*azisu*) which bears a close relationship to female cross cousin; husband (*amezdisu*); and the terms for father-in-law (*asúnusu*), and mother-in-law (*ahainusu*), which are identical to the terms for mother's brother and father's sister. Whether women employ different kinship terms was not ascertained owing to the fact that the women refused to discuss the matter and the male informants persisted in going to sleep when the subject was broached.

582 The kinship terminology supports the statement made by the Nambicuara that cross-cousin marriage is preferred. Excepting one Elótasu woman all the wives in Julio's band were Waklítisu and cross cousins of their husbands. At the death of
587 the husband the wife and children pass to the
768 deceased husband's brother. Women sometimes marry their mother's brothers. Residence is patri-
591 local although when marrying a woman from another band, the man sometimes remains with his wife's band for a while. Band membership, as has been stated, is determined by matrilineal descent.

622 The powers of the chief are limited to leadership in such activities as hunting, planting, trade, and ceremonies. Raids, although organized by the chief, are not led by him. The chief admon-

881 baked manioc and other food which they have been preparing. When the messenger leaves with the food it is a sign that the men will return to camp after sunset.

[302 Before the men arrive the women wash the girl and paint her with a mixture which includes latex 314] from the rubber tree. A series of dots are painted on her face, breasts, abdomen, and thighs (pl. 6, *c* and *d*). When the men come in they dance in front of the girl's hut. She then comes out and is given a name and everyone tries to give her a necklace or some other object. During the night men and women join in the dance, holding hands and dancing in a circle, the dance steps being stamped out with the right foot in the direction in which the circle is moving. A special puberty song is also sung.

881 The Nambicuara tell of a strange medicine
841 known only to the shamans which is given to girls
278 during the puberty ceremony. It is a blue liquid which, when taken internally, stops menstrual bleeding for the remainder of the girl's life. The Wakítisu claim that they do not use it but that the other Eastern Nambicuara band do. The missionaries informed me that the Kitânrbu use this medicine, and the missionaries seemed to think that it was effective.

MARRIAGE

582 There is no special marriage ceremony, for
585 when young people go through the puberty rites they are ready for marriage and a mate is selected for them by their parents. The young man, who
584 is to become the husband of a girl just out of
585 seclusion, goes to her parents and helps his future father-in-law build a small hut, and when it is finished the young man tells the girl to come out hunting with him. She takes a burden basket and they go off into the woods. In the afternoon the man builds a fire and tells the girl to prepare some food and honey. After the food has been eaten he tells the girl to come and lie beside him near the fire. She is supposed to resist and he takes a stick and threatens her. He then has sexual intercourse with her, and when they come back to camp that night they are accepted as a
● [587] married couple. When wives are acquired by inheriting the widow of a brother or by abduction from other bands, no ceremony is held.

[P. 104 (A)]

621 and two persons whom A1 calls "father" and "mother", A65 (about 50 years old) and a66 (about 50), who live in the home of their "daughter" a63.

Fire 15 (67 to 70). --Four persons form two households: A67 "husband" of a2 and called asoinou by A1 because he is the father of his wife a4, and a68, aseetasu of a2, but called aseinosu by A1 because she is the mother of his other wife. And A69 (about 28 years old), "brother" of A42 and asoinou of A1, married to a70 (about 25), undetermined parentage.

Fire 16 (71 and 72). --A71 (about 30 years old), "brother" of A28 and his wife a72 (about 20 years old), "daughter" of A13 and a14.

Fire 17 (73 to 75). --A73 (about 30 years old), former husband of a12 whom he abandoned, and his two wives a74 and a75 (20 to 25 years old), "sisters" of a5.

• • • •

RULES OF RESIDENCE

591 621 The phenomena of spatial distribution do not seem to have special significance in the essentially nomadic groups. Nevertheless, we shall give the plan of distribution of the families in the nomadic camp (chart I), and in the winter village (chart II) for the restricted group, and the plan of distribution of the families or of the fires in semi-permanent camp for the most numerous combination (chart III). [47]

Fig. 12. --Placement of fires (+) and of family groups (△ : man; ○: woman) in the nomad encampment.

591
621

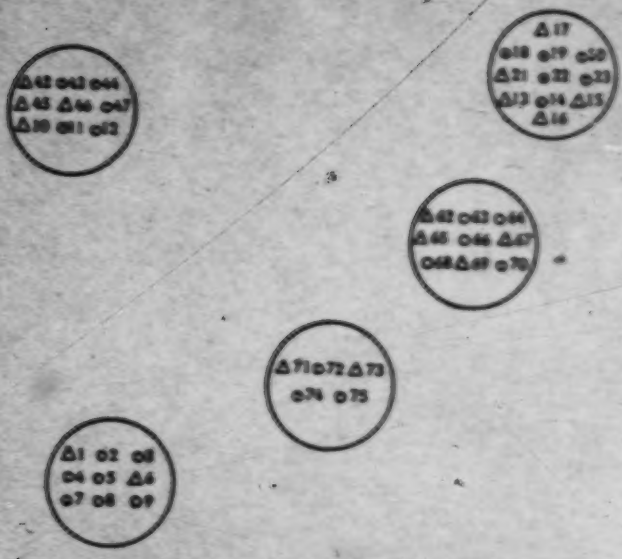

Fig. 13. --Grouping of families in the huts of the winter village.

The examination of these charts calls for several remarks.

(1) The nomadic camp generally obeys fixed rules for the distribution of individuals around the "fires," but not for the distribution of the "fires" in space. Fires 1 to 6 are not distributed in [48] the same way in the nomadic camp (I) and in the general camp (III). In fact, in the latter case, the families arrived one after the other, traveling in groups of two or three, or separately, and came to occupy the available sites. Nevertheless, when the restricted group travels in a single block, its camp is generally in conformance with the distribution given in chart I, which reproduces a camp maintained for one month.

(2) The distribution of the camp fires does not reproduce the distribution of families in the huts of the winter village. However, one will observe that the members of fires 1 and 2, who occupy one and the same hut, camp side by side in chart I, and around the same fire in chart III [49] (but, at this moment, A6 is absent and his family rejoins the fire of his "father"). In the same way, fires 4, 5, and 6, placed side by side in chart I, live together during the winter camping (chart II); but in this latter case, there is a complete separation at the time of the general meeting. It is true that at this moment, A21 has just died, his wife and his baby have rejoined the maternal

[I refers to Fig. 12 and III refers to Fig. 14. --Translator]

591
621

[361]

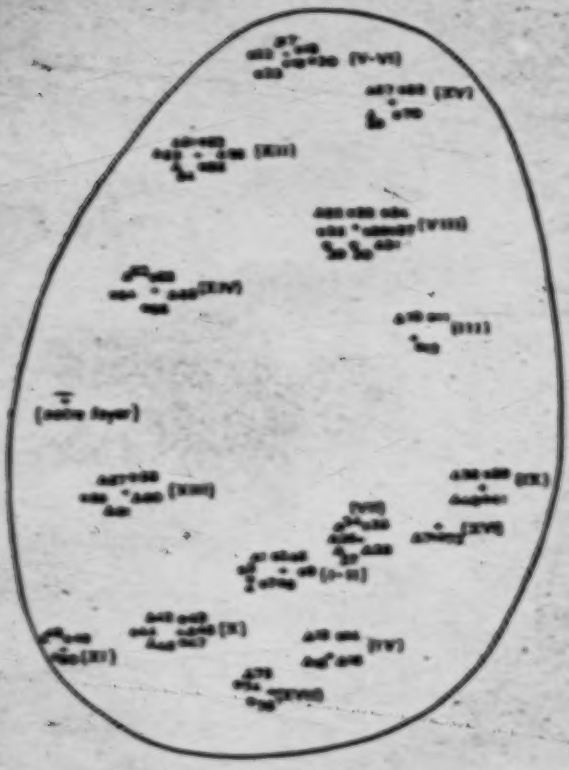

Fig. 14.--Distribution of Families in Temporary Residence.

fire, and the group of six persons has arrived late at the reunion, after an isolated trip. Fires 16 and 17, united at the winter camp (II), are completely isolated in camp (chart III); the same for fires 14 and 15 and for fires 3 and 10.

[24] (3) Since several families join around the same fire, it does not seem possible to deduce any rules of residence, which seems to confirm the impossibility of obtaining from the informants a clear answer to the question of whether the young couples establish themselves separately after marriage, or remain near the parents of the wife or the husband. In two cases, we see the daughters rejoin their parents fire: a12, abandoned by her husband, and a22 at the time of her widowhood. During the winter camp, the household of fire 4 resides with the parents of the husband; and household 6 with the wife's parents (fire 5 in the two cases). Likewise at this time, fire 2 is installed in the hut of the husband's "father." Finally, in two cases, one sees parents, unfit for the economic battle because of age or widowhood, installed at their daughter's fire, as A65 and a68, and

[59] A27 with his son A28. All this offers a very confusing spectacle,
[62] and it is not the only case among the Nambikwara where the sociologist feels discouraged from deducing fixed rules. In a case such as that of the rules of residence, the answers of the Indians and the study of the facts might lead one to conclude that these rules do not exist, but such a conclusion should not be accepted except with the most extreme reservations. We shall be forced from time to time to insist on the fact that, in a society whose demographic base is broken up in a very short space of time, the traditional rules might be clouded by the necessity of solving cases which have become individual and concrete by force of things. Among peoples who live under such strenuous conditions, a certain distribution in elementary associations of individuals of different sex and age might be decisive to assure the means of existence for each of them. Many family combinations seem thus to result from immediate necessities. It could also be that the rules exist, and are based on sociological
[61] reasons which escape us. A society made up of wandering bands which one never finds again with the same composition after a few weeks interval because certain members or families have left it, while others have come to join up; whose camps never offer the same exact distribution from day to day; whose winter huts are most
[50] often destroyed during the dry season; who flee one another, chase one another off, attack each other in frequent conflicts, and about which the least one can say is that in periods of peace, they avoid one another; whose [50] material culture, reduced to the strict minimum, puts into use only rudimentary techniques where social differentiations cannot be expressed; such a society offers to the sociologist ever-changing material, that is fleeting and often cannot be grasped. In very numerous cases, its laws of organization escape analysis and, supposing that they exist, could not be discovered except on the occasion of an extended visit, not only during the period of the nomadic life, but also of the sedentary life.

[62] Central and southern group, dialect b1: tarthde, maimãde (b1); mamãndeti (c) ondndesu, nikpdetosu (a1).

We have divided the encampment of the two groups b1 and c. The latter is composed of 17 persons divided into five fires. Both
[101] were wandering in the zone of the line of the separation of waters
[19] between the Tapajoz and the Madeira (Vilhena Rivers). We shall

621 Elótasu band. This is the custom among all the Eastern Nambicuara bands.

601 The kinship terminology belongs to the bifurcate merging type. The term *tapiéteru* (grandfather) and the term *pantakóisiu* (grandmother) are extended to the brothers and sisters of one's grandparents. The term *watsiu* (father) and the term *akaitsiu* (mother) are extended to father's brother and mother's sister, respectively. Father's sister is termed *akatsuru* and mother's brother *atúsuru*. A man calls his older brother *akandsuru*, his younger brother *dowtíduru*, and his sisters *awtíduru*, these terms being extended to parallel cousins. The terms for son (*akiródu*) and daughter (*akenéru*) are extended to the children of a man whom ego calls brother. The terms for sister's son and daughter are *awátu* and *aténu*, respectively, these terms being extended to the children of anyone whom ego calls sister. The term for male cross cousin is *atítiu* and that for female cross cousin, *dunéru*. There is just one term for grandchildren, *pantadiéruru*.

The only affinal kinship terms which we could obtain were the terms wife (*natéu*) which bears a close relationship to female cross cousin; husband (*awandíu*); and the terms for father-in-law (*atúsuru*), and mother-in-law (*akatsuru*), which are identical to the terms for mother's brother and father's sister. Whether women employ different kinship terms was not ascertained owing to the fact that the women refused to discuss the matter and the male informants persisted in going to sleep when the subject was broached.

582 The kinship terminology supports the statement made by the Nambicuara that cross-cousin marriage is preferred. Excepting one Elótasu woman all the wives in Julio's band were Wakítiau and cross cousins of their husbands.

587 968 At the death of the husband the wife and children pass to the deceased husband's brother. Women sometimes marry their mother's brothers.

591 Residence is patrilocal although when marrying a woman from another band, the man sometimes remains with his wife's band for a while. Band membership, as has been stated, is determined by matrilineal descent.

622 The powers of the chief are limited to leadership in such activities as hunting, planting, trade, and ceremonies. Raids, although organized by the chief, are not led by him. The chief admon-

231 principal spectacle for amusement. One hears such exclama-
521 tions as:

22. ɨakhũninde ɾteru ɨirokũnene (b1)
The flying ants! He (the monkey) catches them to eat!

They talk to the monkey while giving him fruits: ɨoɾɾ, "take!" and as the monkeys live very intimately with the dogs, they laugh hilariously seeing their goings on:

23. hõte ɨãinde miramiraina hõte ɨairɾdnjena (b1).
The monkey mounts the back of the dog! The monkey bites the dog!

and again:

24. kuɣarisena tãkɣlahẽ tãkela ãɣorĩẽ kãdajena (b1).
It is balancing head down, head down it balances, it fell! (the monkey).

231 The children like to play at burning animals, and when
857 insects are involved, they are allowed to do so; but if they try
[865] to burn domestic animals by touching them surreptitiously with a piece of smoldering wood, they are severely reprimanded.

[74] THE GRANDPARENTS

603 We use the term in the classificatory sense, that is, the members of the third ascendant generation. In general, there are few—two in restricted group a1, five out of 75 persons in the enlarged group, three out of 31 in enlarged group b1 (in this estimate we do not include A1, a2 and a14, who can be classed as grandparents indirectly). This small number is
[165 explained, in part, by the very high mortality rate of the
887] Nambikwara, and partially also by the fact that aged persons, although participating in the nomadic life, do not move with the same mobility as the other members of the group, and are met more rarely. Whatever the case may be, the grandparents share the life of their descendants. The founding of a new family does not erase the ties between adults and their parents. We have underlined several examples while studying the phenomena
[592] of residence. Aged or widowed parents join the household of their son or daughter, either permanently or temporarily. Thus, in the absence of his son-in-law (A21) and of his wife (a18), A17 installs himself with his daughter (a22) and her baby (a23). She is the one who cooks manioc and cumaru nuts for the three.

601 Fire 6 (19 to 22). --The chief, or rather, it seems, the shaman of
621 group c, is 30 to 40 years old, "brother" of c23. His dispositions are
[759] friendly and mysterious. We shall encounter him farther on (2). He

2. P. 103.

has two wives, c19 and [54] c21, very pretty girls of 17 or 18 years, "sisters" of the dead husband of c23. Here we have, then, a good example of sororal polygyny. The second woman has a little boy of 3 years, C22.

Fire 7 (23 to 25). --The woman, c23, is over 40; she is a widow and seems to enjoy great consideration. Her numerous "brothers" provide for her as well as her children, and like C20, she is apt to receive supernatural revelations (1). She has a son, C25, about 14

1. Cf. p. 101.

years old, and a daughter, c24, about 10. Concerning them, refer to page 34.

Fire 8 (26 and 27). --A young couple of about 18, whose parents must be dead and whom the elders of the group call "grandchildren."

Fire 9 (28 to 30). --C28, about 25 years, is a "son" of C6; his wife, c29 is older than he (over 40); she is called "daughter" by c19 and c21, although they are by far younger than she; her daughter c30 is about 2 years old.

Fire 10 (31 to 33). --c32, about 40 years old, is a younger sister of c23; she has two daughters: the eldest, c31, about 17, is married; the younger, c33, still a baby. The husband and her son-in-law are absent; they are said to be on a trip together. The group sees to the needs of the two women.

It is suitable to add a visitor to this list, C34, about 30 years old.
[574] He is the brother of c12 and, during his stay, he receives the hospitality of household number 4.

RELATIONSHIPS BETWEEN INDIVIDUALS

Husbands and Wives

593 To understand well the attitude of the two sexes as concerns one another, it is indispensable to keep in mind the fundamental character

593 of the couple among the Nambikwara. It is the economic and psycho-
593 logical unit par excellence. Not only among errant bands which are
182 made and unmade unceasingly does the couple appear as the only
462 stable reality (at least theoretically), but it is the couple alone which assures the subsistence of the members of the group. The Nambikwara live under a double economy: the economy of hunters and gardeners on one hand, the economy of collectors and gatherers on the other. The first is assured by the man, the second by the woman. While the masculine group departs for a whole day to hunt, armed with bows and arrows, or works in the gardens during the rainy season, the women, armed with digging implements, wander with their children across the plain, and gather, pull out, pick, capture, seize [55] everything on their route that is worthy of serving as food: grain, fruits, berries, roots, tubers, eggs, small animals of all sorts. At the end of the day, the couple meets around the fire. When the manioc
[252] is ripe, and as long as it remains so, the man brings a bundle of roots which the women pound and press to make a kind of pancake (uridnosu, a1), and when the hunt has been fruitful, they rapidly cook pieces of small animals by burying them under the burning cinders of the family fire. But for seven months of the year, manioc is rare. As for the hunt, it is most often a matter of chance in these sterile sands
[137] where a skinny small animal hardly ever leaves the shade, and the pasture lands at the heads of rivers are separated from one another by considerable stretches of semi-desert brush. Thus, the family
[241] must most often subsist on the collection of the women. Very often we have attended (and sometimes shared) these diabolical doll-size snacks which, for the Nambikwara, for half the year, are the only hope of not dying of hunger. When the man, silent and fatigued, re-
[262] turns to camp and throws his bow and arrows which he could not use to one side, from the basket of the woman is extracted an extraordinary and moving collection: some orange fruit from the buriti palm (e2eru, a1, e1t2nde, b1, 2ola, c), two fat poisonous spiders (korai'su, a1, kut3nde, b1), some tiny lizards' eggs and some of these animals (katãterisu, a1, nagãde, b1, talĩme, c), a bat, some small nuts from the bacaiuva palm (arookesu, a1, lok3ninde, b1), or uaguassu (aradikisu, a1), a handful of grasshoppers (takedasu, a1, tagere,
[252] b1, taãki, c). The pulpy fruits are crushed with the hands in a calabash filled with water, the nuts cracked with the blows of a stone, the animals and larvae buried pell-mell in the coals; and this repast is gaily devoured, a meal which would not be sufficient to satisfy the hunger of a white person, but which feeds a family here.

593 182 462 The conversation becomes animated and laughter spreads. In the dark prairie the camp fires burn. Around the fire, the only protection against the cold which descends, behind the frail windbreak of palms [342] and branches hastily planted in the ground on the side where wind or [415] rain is expected; near the baskets filled with poor objects which constitute their whole earthly treasure; lying on the ground which extends around, haunted only by other bands equally hostile and fearful, the couples, embracing tightly, are truly seen as the support of one another, the comfort, the only help against the daily difficulties and the dreamy melancholy invades the Nambikwara soul from time to time. The visitor who camps in the brush with the Indians for the first time feels tenderness as well as anguish and pity before the spectacle of this humanity so completely unprotected; crushed, apparently against the soil of a hostile land by some implacable cataclysm; naked, shivering around the hesitant fires. He circulates tip-toe among the underbrush, in the dark, avoiding crushing in his walk a hand, an arm, a trunk, whose warm reflections are seen by the light of the fires. But this misery is animated by whispering and laughter. [56] The couples clasp one another as in the nostalgia of a lost union. Their caresses, at the same time tender and candid, are not interrupted by the passage of the stranger. One senses in all [157] of them an immense gentleness, a profound carelessness, a naive and charming animal satisfaction, and, emanating from all that, something like the most moving and credible expression of human tenderness.

593 831 462 562 [517] Thus it is not surprising that the attitude of the two sexes as concerns one another is characterized by intense interest. This interest is translated in certain cases by the vocabulary. In fact the Nambikwara have only one word to express "pretty" and "young," and a single word to signify "ugly" and "old" (munjene, je?ene, bl). Their esthetic judgments are thus based essentially on human considerations, and above all, sexual ones. But the interest which is manifested between the sexes is of a complex nature. Men judge women in a mass, as being a little different from themselves. Depending on the situation, they consider them with desire, admiration, or tenderness. In itself the confusion of terms pointed out above constitutes permanent homage. But it must not be forgotten that the form of economic adaptation realized by sexual division of labor a capital role attributes to the women, since family life rests to a very large degree (probably the greatest) on the collecting of the women, but it represents an [83] inferior type of activity. The ideal life is conceived on the model of agricultural production or hunting. To have plenty of manioc, and

593 831 462 [83] 562 fat pieces of meat is a constantly relished dream, even though rarely realized. On the other hand, the provisions haphazardly collected are considered—and really are—the daily misery. In Nambikwara folklore, the expression "to eat grasshoppers" (tagare ụ̈rige, bl), a typically feminine and infantile harvest, is nearly equivalent to the French "to eat the mad cow" (to rough it). At the same time the woman is considered a tender and good being, but of the second [198] order. The language which she uses habitually separates her from the men and unites her with the children (in the same way that she collaborates with the children in expeditions of collecting and gleaning). We shall see later that this assimilation also continues into the metaphysical thinking and that, on this latter plan, discrimination between the sexes attains proportions whose psychological attitudes are only a derisive indication. It is considered well-bred for men to speak of women with a pitying good will, and, in conversations between the two sexes, to address them with a slightly mocking indulgence. Certain sayings are heard often among men speaking among themselves:

[538] 5. ụ̈rtnoŝunatukhne ioʔotnuŝutnãdnịani deneŝunatukhne. (bl)
The children do not know, I know, the women do not know.

and they bring up the group of women (dosu, al), their jokes, their conversations, with a tone of tenderness and mockery. But, of course, that is only [57] a social attitude. When the man finds himself alone with his wife around the camp fire, he listens to her complaints, considers her demands attentively, asks her help in a hundred undertakings. The male line of talk disappears, and gives way to the collaboration of two partners conscious of the essential value which they have for one another.

198 562 This ambiguity of male attitude as regards women has its exact correspondence in the equally ambivalent behavior of the female group. The women think of themselves collectively, and manifest it in several ways. In the first place they do not talk like the men. Even though a sexual language does not exist in the true sense of the word, in conversation a thousand inflections, shades of pronunciation are found which are typically feminine. Women articulate badly and affect a sort of jabbering which is reminiscent of infants' pronunciation. They whisper instead of talking out loud, and emit sounds with an affected mannerism and preciosity which are at times seductive when they are not exasperating. Thus, in dialect al, they give words an ending —ŝu instead of the usual—su or —tu. They also pronounce—kititu, the verbal suffix which is for men, —kedjutu or —kedjuzu.

601 The Indians do not seem to perceive
602 the specific nature of certain inter-individual relationships except in
[573] the case of relationships of stepmother and stepfather, as will be seen farther on. Nevertheless, the very great liberty which reigns between a man and his wife on one hand, and his brothers-in-law on the other, contrasts greatly with the more serious and dull character of his dealings with his sisters or his (theoretical) wives. This reserve goes to the point of forbidding the verbal expression of the relationship of potential spouses among the children to a certain degree. In the
[124] course of our interrogations, we have always found it difficult to obtain an answer from the interested parties themselves or from their close relatives when the relationship was that of husband and wife (1).

1. The Indian questioned answers that he "does not know" or changes the subject of conversation.

However, there was no case where the exact answer was not given after several evasive words, or an affectation of ignorance, or an attitude of ill will. But however slight the prohibition (the exact information seems to be considered rather as an impropriety or an
[858] indelicacy), it is no less odd because of it, since children classed as potential spouses behave often, and very openly, as such, without anyone objecting to it.

595 Several times we have alluded to polygamy, concrete examples
462 of which were analyzed on the occasion of the study of the kinship systems. Among the Nambikwara, polygamy represents a general tendency limited by the quantity of available women, and a prerogative existing among the chiefs of the groups, the shamans, or outstanding personalities. From this point of view, it springs from the study of command, and we shall return to this when this problem is tackled. Whenever it exists, polygamy is not a substitute for monogamous marriage, it is added to it without suppressing it. An individual begins by marrying one single woman, and upon the occasion of his social advancement, or of happy occasions, it is suitable for him to add some companions. But a very clear distinction, even though it is not sanctioned by the vocabulary of kinship (2), is

595
601 2. To characterize the functions of the first wife, an informant (A6) once used the term asiẽtu ãꞌoyerelisu (a1); to designate the supplementary wives, another informant (B1) mentioned a form nukẽnãjtere, which could be a feminine of nukẽnãjore (b1), "companion," a term which the chief uses to designate the men of his group. But the

833 lively jubilation. Comments are exchanged, jokes made, and even the young children share in the excitement whose motive they are well acquainted with. Sometimes even a small group of men, young women and children, take off in pursuit of the couple and watch the details of the operation through the branches, whispering among themselves and muffling their laughter. The principal actors do not appreciate these goings on at all. However, it is better to take part in them as well as to suffer the taunts and mockeries which greet their return to camp. It also happens that a second couple follows the example of the first and seeks, in their turn, the solitude of the bush. The Indians know and use two positions for coitus. We were not able to find out if they are practiced indiscriminately or if the choice depends on a rule. Whatever the case, besides the posterior position (toãtelosu, a1; inkɔ̃lékenore, b1--to copulate from the rear) so frequent in South America, another position (uataʔãdige, b1) can be described as follows: the woman on her back, the man facing her, the right leg only between the legs of the woman and the left leg outside, so that the two superimposed bodies give the general form of an X.

[66] PARENTS AND CHILDREN

593 163 847 The Nambikwara have few children. Couples without children are not rare, one or two children seem to be a normal number, and it is exceptional to find more than three in a household. Sexual prohibitions and the economic conditions on which they are based which also give rise to abortions, explain this situation. Apparently also Nambikwara formerly had the custom of beating to death the children whose mothers died during childbirth. According to the informants, this practice has been abandoned today.

853 855 The mother gives the breast lying on her side with the child pressed against her. These feedings have no fixed time. The child nurses when he wishes and as much as he wishes. Weaning takes place towards the end of the first year, but up to the age of two or three the infant returns from time to time to the maternal breast.

[514] When a child eliminates at the camp site or inside the hut, the father or mother carefully buries the excrement by digging a small hole which is quickly filled with dry sand. A great deal of care is taken to prevent the children from soiling the camp site and the objects placed near them:

855 8. ụ̈erisekihĩ́ndage numĩ́ sekɔ̈lajene élamnihĩ́ɔ̈ (b1)
863 The child has urinated! the hide! he is dirty! throw out(the urine)!

Later, when the child can isolate himself but not yet clean himself up, he is seen returning on all fours to his mother and remaining in that position while she applies the small twig in the way that has been previously described.

142 All children seem to have a pigmented blotch at birth to which
856 no particular belief is attached. The informants only mention the phenomenon with that positive and detached attitude so striking on their part:

9. ụ̈ĩ́tte ʂ̂edeʂ̂edédnege tõodaɣige ka̱ ka̱ ka̱ ụ̈udérige (b1)
the children marked with green are born, one day, one day, one day, it disappears.

The disappearance of the blotch actually seems to be very rapid.

593 One should, naturally, distinguish true parentage and classificatory
602 parentage. The child does not adopt any particular form of conduct
609 towards his "fathers" and "mothers" in the classificatory sense of the word. He treats them like other adults of the group. Often, furthermore, an individual calls a boy or girl much younger than himself father or mother (thus a19 and a20 are "mothers" of A6 and A24).
[597] When an orphan is taken in by a parallel uncle or aunt, the classificatory parents take the place of true parents, and consequently the
[601] conduct changes. In general, the Indians do not use [67] a term to distinguish classificatory parents and children from blood ones. When seeking precision, they add the word tauẽttu (a1), tauẽtte (b1): "my little one," to the term for son or daughter (a?kiraru, a?kineru), whose connotation seems thus to be social first of all. The physiological acceptance of this springs from the fact that the word is also used to designate the young of animals, other terms being reserved for relationships of parentage in the human family.

855 The Nambikwara feel very real affection for their children, and
157 show it as regards them, and they are repaid in turn. But these sentiments, however real and profound they may be, are often masked behind the nervousness and instability so characteristic of indigenous conduct. Also, as the following example will show, the risk is to let oneself be fooled by apparent indifference, and even momentary rudeness.

Little A16 suffers from indigestion; he has a headache, vomits, passes half the time groaning and the other half sleeping. He is ill, (intikãtu, a1), but no one, parents included, pays the least attention,

854 11. kalajodné daẽ joʔdnoherẽ (b1)
Take it from the front! Take it from the back!

Or else, amidst great bursts of laughter, she takes the child and pretends to be going to throw him to the ground:

12. ãmdam nõm tebũ nihiɰi (b1)
(The mother) "I am going to throw you!" (the child) "I don't want to!"

855 Reciprocally, the children surround their mother with a tenderness
●593 that is demanding and sometimes unquieting. At the time of leaving group b1, we jokingly proposed to a little girl (b5) that we take her with us. Her response was very characteristic, and at the same time similar to that which many other children would have made under the same circumstances:

13. hõdnjẽ odengenãhien ʃuadaʔien tanãhnãdaje. (b1)
No! I don't want to go! I am afraid! Mama would cry!

And another observation also makes evident the affection which is always present on the part of the child: a father (C20) brings wild honey and begins by giving some to his son (C22), and only then to his wife (c21); the child worried, watches his father's movements to see if his mother will receive her share.

[862] During the period which precedes weaning, the child lives in as
855 great intimacy with his father as his mother. Like the latter, the
593 father takes care of him, holds him in his arms, wipes up his excrement when necessary, etc. Later, the child lives closer to his mother. She carries him on trips till he can walk, and later he walks at her side. He remains with her at camp or village while his father goes hunting. However, the proprieties of relationships depend first of all on the sex of the child. A father shows more interest in his son than in his daughter, since he must teach him the masculine techniques and occupations: and the same thing is true concerning relationships of a mother and daughter. But as a whole, the relationships of the father with his children show the same
[842] tenderness and solicitude that we have previously mentioned. The father plays with his child while carrying him on his shoulder (alakuiriginare, b1). He makes weapons to fit the size of the child's little arms:

14 mifnde tauirẽtnore ikɔlaagetire (b1)
The father makes arrows for the child.

736 [69] Concerning a young male orphan, nearly an adolescent, it was said to us one day that "he does not go hunting because he has no father to make him a bow." In certain cases, the father must extend his care and, to a certain degree, substitute for the absent

[734] wife. We have already cited the case of the two little girls
593 a8 and a9 whose stepmother (a7) refuses to take care of them.
Their father (A6) must, then, assume many of the lesser func-
[842] tions. At the time of departure for a trip, it is he who prepares
the basket for the elder, measures on her the length of the tump
line, and shortens it thanks to the free end which he fastens
passing it several times through the holes of the basket-work.
869 It is also the father who tells the children the traditional stories.
538 And, with a view to shortening and making more intelligible
these often long and repetitious accounts, he applies himself
to transposing them in a style especially adapted for children.
Thus, the infant's version of the story of the Flood (1) is as

1. See below, p. 120, the complete version of this story.

follows:

15. yaitento dohonenŝiram kanaram hepatnẽ atatene
yeidenkjathattene yafndənle. (b1)
Everyone was dead! There was no one left! Not a man!
Everyone was dead! Nothing more!

595 Relationships of a particular nature exist in the case of
571 polygamous marriage between the children of the first wife and
their young stepmothers. Even though the latter are called
"mother" or of "sister of the mother" by them, they live in a
state of companionship with them, especially with the girls,
which also extends to all the children of the group. We have
already dwelled on this society of girls and young wives who
take collective baths, go to defecate in a group, smoke to-
gether, joke and give themselves over to rather farfetched games,
such as spitting long jets of saliva in one another's face. An-
other example: a3 and a4 play with their stepdaughter a5. One
of them pushes her and throws her to the ground with such
violence that her head cracks against the ground and the little
one begins to shriek. The two young women heap mockeries
upon her. Finally, the youngest goes to drag her from the
ground almost by force and pushes her toward her mother, with-
out ceremony, like a package. These relationships are close,
appreciated, but without courtesy, like those which young boys
might have in our society. They rarely imply service or atten-
tion. Thus, A1 and his polygamous wives a3 and a4 divide a

857 iõndage ʃutẽnturu kajãno kajãn kajãn hõte kajãnde ʃutentere kuaikʒno (b1).

When I am big, I shall catch the caetetu, caetetu, caetetu, the monkey, the caetetus, I shall kill them when it (the dog) barks.

[868] She makes an error in grammar which the father points out
857 laughingly: she should have said tilõdage, "when I am big,"
154 instead of the masculine form she used. The error is interesting, placed in context, which manifestly shows a feminine desire to raise the economic activities reserved for that sex to the level of those which are the men's privilege. As the exact sense of ʃutẽntere is "to kill by beating with a stick or club" (here, the digging stick), the informant tries unconsciously to identify [71] feminine collecting and gathering (which can only aim at the capture of small animals) with the masculine hunt, armed with bow and arrows.

●593 The relationships between brothers and sisters have not given rise to any particular observation. In the central and southern group, one finds a special expression to designate the brother of the same sex, nlaõre, "the other one"; this term is not only applied to kinship relationships, but also designates objects be-
[342] longing to the same type. Thus the five or six poles planted obliquely which fan out from the center, and which hold up the
[534] first skeleton of the hut, are called indeleaore; likewise, the double (kalõde) or triple (lutəndione) pipes or whistles. Friendly
857 groups are said to be "brothers" (1) also, and in discussions

1. See p. 92.

between adversaries they use the exclamation:

17. kakõtiane tãkənaãtiane (b1).

Wicked one! You are no longer my brother!

[192] which indicates that among the Nambikwara the term "brother" has the same wide sense which it possesses in our vocabulary.
857 But in the heart of the infantile society, numerous attitudes take
182 form which prepare or advance later relationships. The orphan baby a9 spends nearly the whole day in the hands of her young sister a8 (one is 2 to 3 years old, the other 6 to 7). Her sister takes care of her, carries her, feeds her. a19 and a20 (who are "mothers") act like elders toward these two children, in a way more marked than the real difference in age calls for. In fact, a8 and a20 are contemporaries. The eldest, a19,cracks bacaiuva

The shaman of group c (C20) plays with one of his two wives (c21).

627 The chief admon-
[622] ishes quarrelsome individuals but appears to have no powers of coercion. The Wakitîau claim that individuals quarrel but they do not fight among themselves nor do they remember any cases of murder. Unwanted individuals are exiled by common agreement. Houses, fields, and some implements are common property, and food is shared among the members of the band. Axes, machetes, and knives, although owned by individuals are freely used by other members. At death, privately owned tools pass to a man's sons or to his brother. The bow is customarily broken and left on the grave. Even these rules are not strictly adhered to, for when a man becomes seriously ill other men begin to help themselves to his property and the one with the "strongest mouth" gets the most. If the man recovers he cannot reclaim his things but must set about accumulating a new supply.

543 The wife and the children are under the strict control of the husband. Although boys must obey their fathers they owe no special obedience to their mothers. Boys sometimes throw stones and sticks at their mothers and the old women; the older men not only laugh but even encourage this disobedience. The bond between brothers is very close. On occasion they share each other's wives. No particular respect is paid to in-laws.

RELIGIOUS BELIEFS AND PRACTICES

774 According to the Wakitîau the spirits are the source of all danger, misfortune, sickness, and death. The ghosts of the dead (*aydohadiw*), bring sickness unless offerings of food are made to them. The ghosts of dead shamans (*awánaw*), belonging to other bands bring thunderstorms which destroy gardens and make hunting difficult. In addition to the ghosts, there is *tsuyté*, the hawk of death who lives in the sky, and *ulwrú*, the evil armadillo who lives under the ground and wants to destroy the villages and camps of the Nambicuara.

Tsuyté is an enormous hawk with huge wings, tail, and claws, who sits in a tree made of human bones. This tree (*Idéhuteu*) is situated on the shore of a shallow lake in the sky. Shooting stars are caused by *tsuyté* defecating at night. A small red bird (*dintsuwa*), who lives with *tsuyté*, urinates into the lake and when it fills up the urine overflows and comes down in the form of rain.

[p. 99 (8)]

535 The circling began at seven o'clock in the evening, with continuous chanting. The girls, not once deviating from their course, left regular marks on the dusty ground which were clearly visible in the moonlight. They seemed always to step in the footprints of the first round. Midnight. Near the fires lit by every family, the old people slept; some muttered and poked the embers which gleamed like scattered rubies. Within the circle, perspiring, covered with dust, more dead than alive, we all joined in the chorus: "Tagnaní-ü! Tagnaní-ü! Tangrê!"

Thus it went on all night. Whenever one of us fled and repaired to his hammock, two or three big husky fellows would come talking volubly, and drive the deserter back to his place...

[521] Unfortunately the words of those chants were not recorded. We only know the two words cited: tagnani, the name of the tribe, tangre, which means "star." Was this astrolatry? The three central figures of this dance, in the course of which stars were mentioned, brought to my mind [255] the beautiful constellation of Orion with its Três Marias ["Three Maries"--the Belt].

533 I recorded two Cocozu musical pieces which are rendered here [pp. 73-74]. Prof. Astolpho Tavares has transcribed them into musical notation.

[Fig. 34]

The scale [diapasão] of Nambicuara music is about half a tone lower than our normal scale.

The notes used in the recorded pieces are: do^1, mi^{2b}, fa^2, $fa^{2\#}$, sol^2, la^2. Neither re nor si appear.

The recorded pieces are in la flat major shifting to mi flat minor (Recording No. 1), and in mi minor (Recording No. 2).

The musical motifs develop in two-part time.

184 The Serra do Norte Indians present two distinct kinds of social organization. From this standpoint, the Tagnani and Tawite are more advanced than the Cocozu and Anunze.

593 The latter live under a patriarchal regime: the father rules the [511] family, which is often monogamous. The children, after puberty, start new families according to their own wishes [à vontade] and continue to revere their progenitors.

The Wakitau do not
323 make pottery, but they sometimes acquire pots from the Parecsi in exchange for game or fish.

HUNTING, FISHING, AND COLLECTING

621 Today, at least, the Wakitau band is a producing and consuming unit. Whatever a man or his family gathers is shared among the band. This, however, does not mean that the whole band goes out every day or that they keep together while out hunting, fishing, and collecting. Except
● 594 when the men go hunting such large game as the jaguar, tapir, and peccary, the acquisitive unit is the family. Every morning while Julio's band was camped in Utiarity a family or two could be seen going out, the husband walking in front armed with bow and arrows, the wife following
[142 and carrying a burden basket on her back and a
85 baby strapped on her hip, an older child following
her. As they move slowly along they collect
222 fruits, nuts, insects, snakes, ants, lizards, rats,
wild honey, and a great variety of grubs or larvae.
226 When they come to a pond they wade around with small baskets in their hands and scoop out small fish. On one of these trips I observed them
[252 catching fish that were only 2 inches in length.
262 These were later thrown on hot coals and eaten without being cleaned. Small birds no larger
223 than a sparrow are shot if the man can get near
222 enough to use his bow and arrow. If they come
[344] to a buriti stalk of the right size they will cut it down, put it into the burden basket, and take it
313 to camp. On their way home they will usually pick up dry firewood. Thus, when a family returns at nightfall the basket will be full of a wide assortment of foods and useful materials.

224 Monkeys, deer, and large birds are generally
[197] stalked by a single hunter, particularly if he has a gun. Julio and Marciano each owned a shotgun and quite often hunted alone. If a man goes out in the morning and runs onto a group of peccaries he will hurry back to camp, and all the men will then go to where the peccaries are feeding. When they hear the peccaries the hunters will form into three files, one heading directly toward the pigs, the other two flanking the game on each side. When near enough the middle file stops and spreads out, the other two files then slowly surround the pigs. As the flanking movement is going on the pigs sometimes move, but the middle group of hunters maintains contact

In the triple household
115 of A1, she plays the role of the guardian of the home, and she is al-
[145] ways seen occupied in some culinary or craft job. She reveals
157 little voluntarily, but when she decides to do it, her information is clear and precise. It is always to her that one has recourse to settle knotty cases, to complete a vocabulary of kinship, to respond to a systematic interrogation.

115 a3. --Vigorous girl of some twenty years, secondary wife of A1.
157 Her mother (a63), arîndesu of A1, akenôhosu of a2, is at present married to an asukosu of A1. Her father, dead, was a brother of the father of a4.

She is exuberant, always good-humored, ready to go with her husband on the hardest expeditions, capable of carrying heavy loads. She is a true "force of nature": physically, she is not without [42] charm, she is smiling and full of good health. As an informant she is vague, practically useless.

a4. --About 17 or 18 years of age, the youngest of the wives of A1. Her father and her mother (A67 and a68) are living, asoûnosu and a2 ônosu of A1, oyêmaesu and aseêtasu of a2. She is pretty, coquettish and provocative, does not give herself over to any appreciable activity, except on a trip when she becomes the active collaborator of her husband. She talks voluntarily, laughs a great deal, is very curious about our clothing, utensils, manner of eating and living. Totally inefficient as an informant.

a5. --Eight to 9 years. Daughter of A1 and a2. She has a very
[42] marked sub-nasal prognathism, and has, on the left cheek, a sort of small pimply hole, without doubt due to a tropical ulcer. She is a very calm and amiable child, sensitive to our advances, but who, when she is annoyed, shows sudden fits of anger or outbursts of somber humor during which she is unapproachable. The rest of the time she loves our company and collaborates willingly on the ethnographic work.

A6. --About 30 years: he is the son of an older vanished brother of A1; he calls his paternal uncle "father," the wife a2 of the latter, "mother," and the little a5 "sister." From a first marriage with the daughter of his father's sister (a14), now dead, he has two children (a8 and a9). He is at present remarried (to a7). Otherwise he is vain, satisfied with himself, not very intelligent, a very good father and very taken with his young wife with whom he is always found tenderly embraced. He is a verbose informant, but dull and without personality.

601 The Indians do not seem to perceive
602 the specific nature of certain inter-individual relationships except in
[123] the case of relationships of stepmother and stepfather, as will be seen farther on. Nevertheless, the very great liberty which reigns between a man and his wife on one hand, and his brothers-in-law on the other, contrasts greatly with the more serious and dull character of his dealings with his sisters or his (theoretical) wives. This reserve goes to the point of forbidding the verbal expression of the relationship of potential spouses among the children to a certain degree. In the
[124] course of our interrogations, we have always found it difficult to obtain an answer from the interested parties themselves or from their close relatives when the relationship was that of husband and wife (1).

1. The Indian questioned answers that he "does not know" or changes the subject of conversation.

However, there was no case where the exact answer was not given after several evasive words, or an affectation of ignorance, or an attitude of ill will. But however slight the prohibition (the exact information seems to be considered rather as an impropriety or an
[359] indelicacy), it is no less odd because of it, since children classed as potential spouses behave often, and very openly, as such, without anyone objecting to it.

595 Several times we have alluded to polygamy, concrete examples
462 of which were analyzed on the occasion of the study of the kinship systems. Among the Nambikwara, polygamy represents a general tendency limited by the quantity of available women, and a prerogative existing among the chiefs of the groups, the shamans, or outstanding personalities. From this point of view, it springs from the study of command, and we shall return to this when this problem is tackled. Whenever it exists, polygamy is not a substitute for monogamous marriage, it is added to it without suppressing it. An individual begins by marrying one single woman, and upon the occasion of his social advancement, or of happy occasions, it is suitable for him to add some companions. But a very clear distinction, even though it is not sanctioned by the vocabulary of kinship (2), is

595
601 2. To characterize the functions of the first wife, an informant (A6) once used the term asiɛtu atɔperelisu (a1): to designate the supplementary wives, another informant (B1) mentioned a form nukɔnatere, which could be a feminine of nukɔnatɔre (b1), "companion," a term which the chief uses to designate the men of his group. But the

595
601

sense of this term remains doubtful. And it has never been possible, in the course of the questions on kinship, to obtain from polygamous husbands discriminating terms for each of their wives.

595 462 [252 263] established between the first wife and the new arrivals. The first wife takes care of her children and devotes herself to the cares of the household, shredding the manioc and cooking the cumaru nuts. She is occupied with feminine craft tasks. In short, she carries on her activities within the [61] limits of the sexual division of labor. The other wives aid her occasionally, but their main duty seems to be to assist their husband in his masculine tasks. They are comrades and collaborators who, in the general plan of the division of labor, could be more justifiably classed with the men. Their aid seems like a method on the part of the chief of the group to fulfill his heavy duties more easily, and like a psychological compensation for his responsibilities. When he leaves on a hunting or reconnoitering expedition, one of his polygamous wives accompanies him to hold his arrows and to carry in her basket the eventual prize. When he works around the camp or in the village, it is with their aid and company. [515] Although men and women do not bathe at the same time, one sometimes sees the husband and his polygamous wives take a bath together, the pretext for great struggles in the water, and innumerable jokes. [832 524] In the evening he plays with them, either amorously, rolling in the sand embracing two, three or four, or in a childlike way. For example A1, a3 and a4, stretched out on their backs, by way of making a star with three points on the ground, raise their feet in the air and knock them against one another, bottom of foot against bottom of foot, in a regular rythm (this game is described by the term eridnaikitim, a1).

595 182 The polygamous union is thus presented as a super-imposition of a plural form of amorous companionship on the monogamous marriage, and at the same time, we insist, as an attribute of command with a functional value from the psychological point of view as well as from the economic. The women usually live on very good terms, and although the first wife has a role that might seem a little unappreciated, working while she hears at her side the bursts of laughter of her husband and of his little mistresses, and sometimes even witnesses more tender frolicking, she does not show either bitterness or jealousy. In fact, this distribution of roles is not either unchangeable or rigorous, and, upon occasion, although rarely, the

595 husband and his first wife will also play, while bathing or near the
182 camp fire. She is in no way excluded from the gay life. Moreover, her slighter participation in relationships of amorous comradeship is compensated by a greater respectability and a certain authority over her young companions. It must not be forgotten (and we have
595 pointed it out in the study of the kinship system) that the polygamous
382 marriage presents a double aspect--the marriage of a man with a woman and with some "daughters" of the latter, or with a woman and the "sisters" of the latter. The respective situations of A1, a2 and a3 and a4 realize the two situations at the same time since, at least in one of the cases (with a4), it is the second oblique marriage within the same line. As example of the first type, we have the marriages of A32 and of A56; for the second type, one can also refer to the marriage of C20 (1).

1. Cf. above, p. 53.

595 The polygamous wives then, as a general rule, belong to a
571 younger generation. The first wife calls them "daughters" or of "little sisters," and they behave as such. A form of spontaneous grouping which one finds realized frequently is the union of the husband's daughters (by his first wife) and his young wives (polygamous). They form a sort of gay and carefree childlike society, but also a more or less subordinate society. We have found households comprised of two (A42, A57, A73, B1, B32, C20), three (A1,) and five (A32) wives. It does not seem that the number of wives is proportional to the social importance of the husband (even though polygamous union itself is conditioned by this), but is rather haphazard.

SEX LIFE

000 We shall begin by giving some information concerning organic activities.

514 Coughing, sneezing, spitting, blowing the nose, belching, ex-
515 pelling flatus, constitute operations which are not subject to any
576 etiquette, and which the vocabulary does not always clearly distinguish (thus: tolitʃige, b1, to cough, and tolitʃiore, b2, to sneeze; kaite, sneeze, and kastʃe, c, spit, tarnikititu, a1, to expel flatus or defecate). All of these needs are satisfied publicly, without precaution, ritual gesture or formula, as much on the part of the executor as on that of the spectators. No attention is paid to them, and everything

[734] wife. We have already cited the case of the two little girls
913 a8 and a9 whose stepmother (a7) refuses to take care of them.
Their father (A6) must, then, assume many of the lesser func-
[842] tions. At the time of departure for a trip, it is he who prepares
the basket for the elder, measures on her the length of the tump
line, and shortens it thanks to the free end which he fastens
passing it several times through the holes of the basket-work.
869 It is also the father who tells the children the traditional stories.
538 And, with a view to shortening and making more intelligible
these often long and repetitious accounts, he applies himself
to transposing them in a style especially adapted for children.
Thus, the infant's version of the story of the Flood (1) is as

1. See below, p. 120, the complete version of this story.

follows:

15. ųãtemo dohonenãiram kãnaram hẽpatnẽ atãtene
ųeidenkiathattene ųafndẽnle. (b1)
Everyone was dead! There was no one left! Not a man!
Everyone was dead! Nothing more!

595 Relationships of a particular nature exist in the case of
571 polygamous marriage between the children of the first wife and
their young stepmothers. Even though the latter are called
"mother" or of "sister of the mother" by them, they live in a
state of companionship with them, especially with the girls,
which also extends to all the children of the group. We have
already dwelled on this society of girls and young wives who
take collective baths, go to defecate in a group, smoke to-
gether, joke and give themselves over to rather farfetched games,
such as spitting long jets of saliva in one another's face. An-
other example: a3 and a4 play with their stepdaughter a5. One
of them pushes her and throws her to the ground with such
violence that her head cracks against the ground and the little
one begins to shriek. The two young women heap mockeries
upon her. Finally, the youngest goes to drag her from the
ground almost by force and pushes her toward her mother, with-
out ceremony, like a package. These relationships are close,
appreciated, but without courtesy, like those which young boys
might have in our society. They rarely imply service or atten-
tion. Thus, A1 and his polygamous wives a3 and a4 divide a

595
571 piece of small animal. a5 asks for part of it and a4 answers:
"Let your father give you his." These relationships bring about
854 a rather curious consequence: the young girls become independ-
595 ent more rapidly than the boys. They follow the young wives,
take part in their activities, while the boys, left to themselves,
timidly try to adapt themselves to the group but without great
success, and usually remain, at least in earliest childhood, be-
side their mothers.

857 [70] Considering now the relationships of children among
themselves, the most striking characteristic is the absence of
play. In certain groups (central and south), the children
manufacture, although rarely, small objects of rolled or braided
straw, but generally they know no other distraction than fights
or contests which they do together, and lead an existence
modeled on that of the adults. In fact, they carry on the normal
day of the women: in the morning, preparing the manioc, then
the cumaru nuts, bathing when it begins to get warm; when the
sun is very high, retiring to the shade, and before night, gather-
ing wood for the fire. Likewise, the girls learn to weave, they
walk around, laugh, sleep. The little boys do not begin to
play with little bows and imitate the male pursuits until much
later (from 8 to 10 years on). But all become rapidly conscious
of the fundamental and sometimes tragic problem of Nambikwara
life, that of nourishment, and of the active role that is expected
of them. They take part in the harvesting and collecting ex-
peditions with great excitement. In time of need, it is not rare
to see them seek their own food outside the camp, working to
unearth roots, or walking in the grass on tiptoe, a large stripped
branch in hand, to catch grasshoppers. The little girls know
what an important role the women have in the economic life of
the tribe, and are impatient to make themselves worthy of it.
[231 Thus, we find a young girl (b5) who tenderly carries a puppy
482] in the tump line that her mother uses for her little sister, and
we make the remark:

16. uainuttte ufkɔrage
She caresses the little puppy?

Her mother answers me:

uefkuãtnore uainuetuikadeʔena tãjtniene
The little girl caresses the puppy (because she wishes) to
raise it.

to which the little girl adds gravely:

838 Because of the fact of partial polygamy which reigns within
[595 the group, and which is manifested in the fact that the youngest
582 and prettiest women are periodically withdrawn by the chief or
605 the shaman from the regular cycle of marriage, the young men often find themselves in difficulty as regards marriage, at least during part of their adolescence, no potential wife being available. This problem is resolved by homosexual relationships, which the Nambikwara language (bl) has named poetically: tamindige kihãdige, that is false love. These relationships are frequent among young people and are carried on much more publicly than normal relations. The couples do not retire to the bush as the adults usually do. They install themselves near a fire of the camp under the amused eyes of the neighbors. The incident gives rise to some joking comments, usually not carried very far. These relations are considered infantile, and hardly any attention is paid them. The question remains unanswered for us as to whether these practices are carried on to complete satisfaction, or are limited to sentimental effusions, accompanied by erotic play such as those which characterizes, for the most part, relations between husband and wife. Whatever the case may be, the essential point here is that homosexual relations are exclusively relations between cross cousins. Whenever one seeks information from an Indian concerning a relationship of the type just described, the typical response obtained is:

25. tarutebãdige tamĩndige (bl)
(those are) two brothers-in-law making love.

838 We have not been able to ascertain if these relationships of
605 adolescence continue between adults. It seems hardly probable.
607 But relationships of a very special nature are maintained between "brothers-in-law. They exhibit great familiarity toward one another, have among themselves effusions such as we have never noted among brothers or relatives of another degree. Among the
[201] Nambikwara (always prodigious, of course, with affectionate gestures) it is not rare to see two or three men, married and fathers of families, walking in the evening tenderly embracing. The information obtained is, here too, always the same:

26. tarũte ialhaʔete. (bl)
The brothers-in-law are embracing.

607 Certain games, like the "the game of claws (griffes)"
524 (kajrobĩtunubi, c) are frequent among brothers-in-law.

T
N
595 As regards polygamy and the distinction, so clear among the
171 Nambikwara, between the first wife devoted to household tasks and the secondary wives, companions of the men and sharing their obligations, it will be remembered that Magalhães de Gandavo alludes to a category of women actually unmarried, but who take part in masculine activity (3).

3. Gandavo, loc. cit., II, Ch. 10, p. 89. One will find other information about the family organization of the ancient Tupi in: A. Métraux, La religion des Tupinamba (Paris, Leroux, 1928), passim; --Lafone Quevedo, "Guarani kinship terms as an index of social organization (American Anthropologist, Vol. 21, 1919), p. 421-440; --P. Kirchhoff, "Die Verwandtschaftorganisation der Urwaldstämme Südamerikas (Zeitschrift für Ethnologie, Vol. 63, 1931, Ch. 15, p. 182).

T
N
607 All of these observations authorize us to trace a parallel between
171 the extension of the relationship of "brother-in-law" among the Nambikwara, and a custom, seemingly very close, of the ancient Tupi. First we quote from Yves d'Evreux: " A party of Frenchmen was dispersed throughout the villages to live there according to the

854 From this time on, the life of the Nambikwara infant goes on as we have described, and without there being much differentiation according to sex. These differences begin to appear only at the ap-
881 proach of puberty. At this time, the girls adopt a completely new behavior. They allow themselves great liberties, speaking brutally to their entourage and [109] amusing themselves with obscene acts. The fact is that the ceremony of puberty, which coincides with mar-
[553] riage, marks a decided change in her life and it is also upon that occasion that she receives her name. The Nambikwara women marry
582 very soon after their first menstruation. The polygamy of the chiefs
[595] creates a permanent deficit of women, and the newly available wife is impatiently awaited. According to our informants, it is the young
584 girl who indicates to her parents which of her potential husbands she wishes to marry. She says that she "wishes to marry quickly" (ikiⁿdurige, bl); the term of dialect al for "to marry" being oyensaikititu, literally: "to make a husband," it seems that, as has been affirmed, the initiative belongs to the girl:

48. inka (ni) durednjẽn durẽnẽ (bl)
"I wish to marry quickly" [says the girl]. "Mary," says the mother] (?)

Actually, it seems that the marriage is decided from infancy by an agreement between the parents. Farseeing parents must prepare far in advance the marriage of their son, for otherwise the latter risks not finding an available woman. Brothers-in-law have often indicated to us that their children were promised to one another.

881 At the time of puberty, the young girl is completely isolated for a period of from two to four months. She lives in a specially constructed shelter some distance from the village, and lives there alone, observing a series of alimentary and social taboos. During this period, her mother feeds her and takes care of her. The period of segration ended, songs and dances take place. Her shelter is torn down and "the mother takes back her child." Then the ceremony proper of marriage takes place. It is prepared by hunting and fishing expeditions and is carried out amidst chants and dances:

49. ʃirige ajũngnerage denano inĩra ʃikira ʃiknira tãta halonoo tatiʔkta ʃindage hntimbãta uʔrige imãgara imãgara (bl)
Go get fish, the women arrive, arrive, to broil [the fish] in the square go out, sing, whistle, play the flute, play the flute.

411 string (secondary release). Four types of arrows are used: (1) featherless fishing arrow with three to five prongs; (2) bird arrow with a blunt point; (3) big-game arrow with a lanceolate bamboo point; and (4) poisoned arrow, used chiefly for hunting monkeys, with several barbs which are attached to the point with cotton wrapping and which break easily in the wound, being, therefore, usually protected by a bamboo sheath. The last three have a bamboo shaft and "Arara" feathering. Sewed feathering is known by the central and northern groups but seldom [726] used. For warfare, big game arrows with serrated bamboo points are used.

278 *Nambicuara* arrow poison is a curare prepared by grating the root of a *Strychnos* shrub, and by infusing (*Eastern Nambicuara*) or boiling (*Central* and *Northern Nambicuara*) it until the water evaporates and leaves a thick brownish substance, which is smeared on a wax-coated arrow point. It can be preserved in tiny pots for several months. Among South American arrow poisons, it is remarkable because it is made of only one vegetable substance and is prepared openly—in some groups by the chief or shaman, in other groups by anyone—without magical practices or taboos. Its great toxic properties were studied by Vellard (1939 b).

Other poisons of unknown composition are used for amorous or political revenge. They are in the form of powders and are kept in tubes made of feather quills, bamboo, or other woods, each ornamented with paintings and cotton or bark wrappings.

411 Clubs are carved in the shape of a flattened or cylindrical pointed spade; the handle is often adorned with black and white plaiting of philodendron bark and bamboo strips. Their purpose is mostly ceremonial.

SOCIAL AND POLITICAL ORGANIZATION

601 Kinship terms identify parallel-cousins with siblings, and cross-cousins with potential or actual spouses. Cross-uncles and cross-aunts are called by the same terms as parents-in-law and grandparents; parallel-uncles and parallel-aunts are equated with parents. Similarly, parallel-nephews and parallel-nieces are classed with children, and cross-nephews and cross-[582] nieces with children-in-law. Marriage is between cross-cousins or between the maternal uncle and his niece. Monogamy is the rule, but [595] polygyny is the privilege of the chief and other important men. Polygyny is usually with several sisters (sororal) or with a woman and her daughters by a former union. The first wife runs the household, subsequent wives being assistants to the husband. The deficiency of available women which results from polygyny is compensated by homosexuality [838] between adolescent male cross-cousins (Lévi-Strauss, 1943 a).

622 The village is ruled by a chief, but each of the nomadic bands into which it splits during the dry season is led by a secondary chief. Chief-

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

particular form of their own. Death is identified with these spirits. Men's souls are believed to be reincarnated as jaguars, whereas women's and children's souls are taken away by wind and thunder, never to return.

The highest being is the Thunder, with which any man, though usually a shaman, may have personal contact through revelations and visions. Women, however, except when very old, and children are deprived of these privileges. Women are also forbidden, under pain of death, to see the sacred flageolets (see Musical Instruments, p. 368) played at the ceremonies marking the beginning and the end of the dry season.

SHAMANISM AND MEDICINE

The shaman is sometimes distinct from—but more frequently identified with—the political chief. He is distinguished by having the privilege of polygyny, playing the leading role in ceremonial life, and possessing special supernatural powers. He treats patients by sucking out the disease or by fighting it with small ritual arrows called "thunder-arrows."

In addition to magical cures, the *Nambicuara* treat sickness with numerous medicinal plants, which are used externally or internally according to the disease. For eye infection, which is very frequent, they apply the infusion of a special bark with the help of a container made of leaves.

FOLKLORE, LORE, AND LEARNING

The only legend recorded by Lévi-Strauss (n.d. b) is a flood tale relating the destruction of human life and its re-creation through several incestuous marriages between the offspring of an old woman, who was the only being who escaped the disaster.

The only basic numbers used for counting are one and two, but the natives can reckon higher figures by combining these.

Colors are classified differently according to the dialects. The *Eastern, Central, Southern,* and *Western Nambicuara* agree in putting yellow and green in the same category, whereas the *Northern* group identify red and yellow, and class green, blue, and black together.

Some *Nambicuara* groups call stars by the same name which designates the spirits. The year is divided into two seasons and an undetermined number of lunar months. The day includes six main stages, each based on the position of the sun. Space is divided into two sections that are perpendicular to each other, one corresponding to the apparent movement of the sun and the other to the direction of the main waterways.

622 and to meet groups too shy to venture forth on the outer fringe. The native band and my own group set out together on a journey supposed to be short; but, because of the animals I had taken, the chief had decided that the usual route through a dense forest could not be used. He led us through the open country, lost his way several times, and we did not reach our destination on the scheduled day. Supplies were exhausted and no game was in sight. The not unfamiliar prospect of a foodless day fell gloomily upon the natives. But, this time, it was the chief's responsibility. The whole project was his own, as well as the attempt to find an easier route. So, instead of trying to discover food, the hungry natives simply lay down in the shadow of the brush and waited for their leader to take them out of this most unpleasant situation. He did not wait or discuss; but, taking the incident as a matter of course, he simply left the camp accompanied by one of his wives. At the camp, the day was spent sleeping, gossiping and complaining. There was no lunch or dinner. But, late at dusk, the chief and his wife reappeared, both heavily laden with baskets filled to the [262] brim. They had hunted grasshoppers the entire day, and, although the expression "to eat grasshoppers" has approximately the same meaning in Nambikuara as the French *manger de la vache enragée*,[5] this food was enthusiastically received, shared and consumed, amidst restored good humor. The following morning, everybody armed himself or herself with a leafless twig and went grasshopper-hunting.

622 I have several times referred to the chief's wives. Polygamy, which is practically the chief's privilege, brings him a moral and sentimental reward for his heavy duties together with the practical means of fulfilling them. In the Nambikuara band, apart from rare exceptions, only the chief and the sorcerer (when these functions are divided between two individuals) may have several wives. The chief's polygamy, however, presents special features. It does not constitute a plural marriage but rather a monogamous marriage to which relations of a different nature are added. I have already mentioned the fact that cross-cousin marriage is the usual pattern among the Nambikuara. Another type of marriage also exists, between a man and a woman belonging to the generation following his own, either a wife's "daughter" (true or classificatory) or a sister's niece. Both forms are not uncommon in South America and, together or separately, they have been re-

[5] Closest English equivalent: "to have a rough time of it, to go through the mill."

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

corded among many tribes. Now, what do we find in the chief's case? There is first a monogamous marriage of the cross-cousin type, that is, where the wife belongs to the same generation as her husband. This first wife plays the same part as the monogamous wife in ordinary marriages. She follows the sexual pattern of the division of labor, taking care of the children, doing the cooking, and collecting and gathering wild food. To this marriage are added one or several unions, which, technically, are true marriages, but of a different type. Usually, the secondary wives belong to a younger generation. The first wife calls them daughters or nieces. Besides, they do not follow the sexual pattern of the division of labor, but share indifferently in men's or women's activities. At the camp, they disdain domestic tasks and remain idle, either playing with the children to whose generation they belong or flirting with their husband, while the first wife keeps busy with the food and the fire. On the contrary, when the chief leaves on an exploration, a hunt, or some other manly task, they will accompany him and bring him their moral and physical help. These somewhat "tomboy" girls, elected by the chief from among the prettiest and healthiest of the group, are to him rather "girl-friends" than spouses. They live on the basis of an amorous friendship which contrasts strongly with the more conjugal atmosphere of the first marriage.

This system exerts a tremendous influence upon the whole life of the group. The periodical withdrawal by the chief of young women from the regular cycle of marriages creates a permanent unbalance within the group, between the number of boys and girls of marriageable age. Young men are the chief victims of that situation and must either remain bachelors for several years or marry widows or old women discarded by their husbands. Thus, the right to plural marriage represents a concession of considerable importance made by the group to its leader. What does it mean from the latter's point of view? There is little doubt that access to young and pretty girls brings him a much appreciated gratification, not so much from the physical side (as the Nambikuara share in the quiet dispositions of most South American tribes), as from the psychological and sentimental one. But, above all, plural marriage, together with its distinctive features, constitutes the technical means and the functional device placed at the chief's disposal by the group to enable him to carry out his exacting duties. Left by himself, he could hardly do more than the others. His secondary wives, freed by their special status from the customary

3: Lévi-Strauss E-5 (1938-1939) 1944
SP17 Nambicuara SP17

622 liabilities of their sex, are his helpers, comforters and assistants. They
515 are, at the same time, leadership's prize and instrument. Can it be
182 said, from the native point of view, that the prize is worth the trouble? To answer that question, I shall now have to consider the problem from a broader angle, namely, what does this elementary social structure, the Nambikuara band, teach us about leadership, its basis and its function?

121 There is a first point which does not require great elaboration. Nambikuara data contribute, with many others, to destroy the belief originated by early anthropologists, and temporarily revived by psychoanalysis, that the primitive chief could find his prototype in a symbolical father, and that the simpler forms of the State could progressively have grown out of the family. We have found at the root of the crudest forms of chieftainship a decisive step, which introduced something entirely new in respect to biological relations—and this step consists of *consent*. Consent, we have seen, is at the same time the origin and the limit of leadership. Unilateral relations such as right of age, aristocratic power, or others, may appear in groups having an already complex structure. In simple forms of social organization, such as the one I have tried to describe, they are inconceivable. Here, on the contrary, the relationship between the chief and the group can be seen as a perpetual process of arbitration where the chief's talents and authority on the one hand and the group's ease, cohesion and willingness, on the other, constantly react on and influence each other. If I had the time, and if it were not so far removed from my topic, I would have liked to show what considerable support modern anthropological observations bring, in this respect, to the analysis of the eighteenth century social philosophers. I am well aware of the fact that Rousseau's "social contract," which is the step by which individuals resign their autonomy in favor of the General Will, is entirely different from the nearly contractual relations existing between the chief and his followers. It remains true, however, that Rousseau and his contemporaries displayed a keen sociological feeling when they understood that cultural attitudes and elements such as "contract" and "consent" are not the result of secondary processes, as claimed by their opponents; they are culture's raw materials, and it is impossible to conceive a political or social organization in which they would not already be present. If I understand correctly, the recent analysis, by modern American

ooo sionaries had not yet learned enough Iranxe to make working with informants possible.

621 As all of the following information, unless otherwise specified, relates to the Wakitiu band, a
622 short description of this band is in order. Today the band consists of 18 individuals, of which Julio
[731] is the chief. About 5 years ago, before a measles epidemic decimated it, the band was roughly twice the size it is today. Julio is a man of middle age, has three wives and two children, and probably holds his leadership by being the strongest and ablest man in the band. Except for one of Julio's wives and her daughter who are Elótaxu, the members of the band are Wakitiu and
•[595 related to one another. Julio took the Elótaxu
583] woman from the Elótaxu band by killing her husband. He claims he did this because the Elótaxu *chief* stole one of his wives some years ago. He claims he is going to steal another wife, for every *chief* is supposed to have four. Only three other men, Martin, Marciano, and Joaquin, are married, each having one wife. The remaining four are either widowers or as yet unmarried.

164 Of all the Indians which I have visited in Mato Grosso the members of this band of Nambicuara were the most miserable. Of the eight men, one had syphilis, another had some kind of infection in his side, another had an injured foot, another was covered with some kind of scaly skin disease from head to foot, and another was *deaf* and dumb. The women and children, however, appeared to be
515 healthy. Owing to the fact that they use no
[513] hammocks but sleep on the ground, they are always covered with dirt. On cold nights they remove the fire and sleep in the warm ashes.
[291] The Wakitiu wear clothes only when they are given by the missionaries, who ask that they be worn. Their distaste for bathing permits not only a covering of dust and ashes to accumulate on their skin and hair but also particles of decayed meat and fish, which, combined with stale sweat, makes proximity to them rather distasteful. They
[164] also appear to be heavily infected with internal parasites, for their stomaches are distended and they are continually passing wind. On several occasions when a number of them had crowded into the small room we used for working we had to cease work in order to air the room.

181 In their manners the Nambicuara also contrast
171 sharply with the other tribes I visited. The

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

ing to the children of the father's sisters and of the mother's brothers, a man calls all his female cross cousins (to one of whom he is or will be married) "wife," and all his male cross cousins "brother-in-law;" conversely, a woman calls all her male cross cousins (among whom her actual or potential husband is numbered) "husband" and all her female cross cousins "sister-in-law." No terminological difference is made between actual and potential spouses. The members of the next younger generation are similarly divided into "sons" and "daughters" (Ego's own children and parallel nephews and nieces) and "sons-in-law" and "daughters-in-law" (Ego's cross nephews and nieces), since these are or may be the spouses of his children.

The system is somewhat complicated by secondary distinctions made between elder and younger siblings and by the fact that another kind of marriage ——between a maternal uncle and his niece—is also practised. This new pattern usually appears in the polygynous unions which, in the prevailingly monogamous Nambikuara society, are the privilege of the chief. This point needs some elaboration. Nambikuara polygyny results from the fact that, subsequent to a first marriage having all the characteristics of the common (i.e., the cross cousin) form, a man may contract one or more unions of somewhat different nature. Actually, the position of his new wives is not the same as that of his original one, and, although constituting real marriages, the later unions are nevertheless psychologically and economically different from the first. The atmosphere in which they evolve is less conjugal and more like a kind of amorous friendship. The younger wives cooperate more extensively in the numerous tasks imposed on their husband because of his special social obligations. Furthermore, the activities of these women do not conform as closely as those of the first wife to the general pattern of the sexual division of labor. Finally, they are younger and are classified, in relation to the earlier wife, as "daughters" or "nieces." Such "oblique" unions (that is, between members of different generations) may also take place in monogamous marriages, but less frequently. Although their occurrence among the Nambikuara is an important point in our demonstration, the consequent modifications of the kinship system are not essential for the purposes of this article and we may therefore omit further mention of them. Our present observations will be limited to the special implications of the brother-in-law relationship which is expressed through the reciprocal terms *aɨkkeru* (Eastern dialect), *tarɨiɨ* (Central and Western dialect) or *iɨpa* (Northern dialect).

It must be emphasized immediately that this useful translation of the native term is not in any way accurate. While the *aɨkkeru* is a man's male cross cousin and also his potential brother-in-law, since the persons calling each other *aɨkkeru* (or *tarɨiɨ* or *iɨpa*) call each other's sisters "wife," it is only in particular instances that one or more of the individuals involved is, in fact, the wife's brother or the sister's husband or both. The meaning of the term *aɨkkeru*

6: Levi-Strauss E-5 (1938-1939) 1943
SP17 Nambicuara SP17

595
171

Regarding polygyny and the sharp differentiation made among the Nambikuara between the first wife who devotes herself to feminine activities and the younger wives who are their husband's companions and share his tasks, it may be recalled that Magalhaes de Gandavo[17] refers to a special category of women, single indeed, who shared in masculine activities.[18]

171
114

The preceding similarities may perhaps allow us to establish a valid comparison between our observations concerning the extension of the "brother-in-law" relationship among the Nambikuara and what seems to have been a very similar institution among the ancient Tupi. We first quote Yves d'Evreux:

> They scattered part of the French through the villages so that they might live according to the custom of the land, which consists in having *cheveuseap*, that is to say, hosts or god-sibs (*compères*), giving them merchandise instead of money. Such hospitality or god-sib relationship is very close among them, for they regard you as their child as long as you stay with them. They hunt and fish for you and, what is more, they used to give their daughters to their god-sibs (*compères*).[19]

The same author refers later to the "French who were established in the villages in a god-sib relationship (*compérage*)."[20] Evidence of the aboriginal institution may also be found in Jean de Léry:

> It is worth remarking that the words *simo-assap* and *coüem-assap* differ, because the first signifies a perfect alliance between them and between them and us, so much so that the belongings of the one are common to the other. And also that they cannot have the daughter or sister of the first named.[21]

From this one may infer, conversely, that marriage is authorized with the sister and the daughter of the *coüem-assap*. Therefore, the *coüem-assap* is granted a double privilege: first, marriage with his partner's sister, which makes him a "brother-in-law"; and, secondly, marriage with his partner's daughter, which is equivalent to his assimilation to the rank of "maternal uncle";—then, because he is considered a theoretical brother of his partner's wife, he also becomes a theoretical brother-in-law. Actually, therefore, both privileges have the same result.

171
607
582

One more similarity between the Tupi and Nambikuara brother-in-law relationship remains to be pointed out. All the texts quoted agree that there existed among the Tupi a kind of authority held by young men over their

855 8. gêrisekihfndage numf sekalajene élamnihfge(bl)
863 The child has urinated! the hide! he is dirty! throw out(the urine)!

Later, when the child can isolate himself but not yet clean himself up, he is seen returning on all fours to his mother and remaining in that position while she applies the small twig in the way that has been previously described.

142 All children seem to have a pigmented blotch at birth to which
856 no particular belief is attached. The informants only mention the phenomenon with that positive and detached attitude so striking on their part:

9. gîtte ĵêdeĵêdêdnege tôodaŋige kâ kâ kâ gudêrige (bl)
the children marked with green are born, one day, one day, one day, it disappears.

The disappearance of the blotch actually seems to be very rapid.

593 One should, naturally, distinguish true parentage and classificatory
602 parentage. The child does not adopt any particular form of conduct
609 towards his "fathers" and "mothers" in the classificatory sense of the word. He treats them like other adults of the group. Often, furthermore, an individual calls a boy or girl much younger than himself father or mother (thus a19 and a20 are "mothers" of A6 and A24).
●[597] When an orphan is taken in by a parallel uncle or aunt, the classificatory parents take the place of true parents, and consequently the
[601] conduct changes. In general, the Indians do not use [67] a term to distinguish classificatory parents and children from blood ones. When seeking precision, they add the word tayêttu (a1), tayêtte (bl): "my little one," to the term for son or daughter (a?kiraru, a?kineru), whose connotation seems thus to be social first of all. The physiological acceptance of this springs from the fact that the word is also used to designate the young of animals, other terms being reserved for relationships of parentage in the human family.

855 The Nambikwara feel very real affection for their children, and
157 show it as regards them, and they are repaid in turn. But these sentiments, however real and profound they may be, are often masked behind the nervousness and instability so characteristic of indigenous conduct. Also, as the following example will show, the risk is to let oneself be fooled by apparent indifference, and even momentary rudeness.

Little A16 suffers from indigestion; he has a headache, vomits, passes half the time groaning and the other half sleeping. He is ill, (intikâtu, a1), but no one, parents included, pays the least attention,

1: Lévi-Strauss--19 E-6 (1938-1939)1948 SP17 Nambicuara SP17

PART I

FAMILY LIFE

KINSHIP SYSTEM

601 Whether the social unit under consideration be the temporary village or the nomadic band, the kinship system of the Nambikwara can as a whole be described as follows.

For any subject, male or female, all the members of his generation are divided into four large groups, that is two male groups [18] and two female groups. If the subject under consideration is a man, all the men of his generation will be divided into brothers and husbands of sisters (or brothers-in-law); while the women are divided into sisters and wives. In the same way, if the subject is a woman, all her female companions will be designated as sisters or as wives of brothers (sisters-in-law); and her male companions will share the names of brothers or husbands. Thus a man calls wife a number of women considerably larger than the number of his true wives, even if he is polygamous. And the woman, even though she is always monogamous, calls probably half of the men of her generation by the name of husband. In the same way brothers and sisters are far more numerous than actual brothers and sisters, that is, blood relatives. These latter are distributed into two sub-groups, the older brothers and the younger brothers in one, the older sisters and the younger sisters in the other. The term used to designate younger (blood) brothers and younger (blood) sisters also serves to designate "brothers" and "sisters" who are not blood relations, whatever their age may be compared to the subject under consideration.

A subject, male or female, calls his blood father father and all the latter's brothers; he calls his own mother mother and all her sisters. Reciprocally, all his "fathers" and all his "mothers" call him by the name of child, son, or daughter.

A single term is likewise used to designate the father of the father (or of the mother), the wife's father, and the mother's brother, while one and the same term serves to designate the mother of the father (or of the mother), the wife's mother, and the father's sister. But, contrary to the preceding case, there exists no reciprocal term. The father (or the mother) of my father and of my mother call me by a term connotating parents to the third generation, while my spouse's father and my mother's brother, on one hand (regularly identified), the mother of my spouse and my father's sister, on the other hand

●60 (regularly identified), call me by a name meaning nephew and son-in-law, niece and daughter-in-law at the same time. Thus spouse's parents and my parents's parents identified when I name them, distinguish themselves when they answer me, since they use different terms as regards me.

Passing from the direct line to the collateral line, a generation is lost, since the same term is used to designate the parents of the spouse or the parents' parents. A grand-nephew is thus theoretically separated from his great-uncles by four levels of kinship, while he is only three degrees away in kinship from his grand-parents, who nevertheless identify themselves with his great-uncles, for the brother of the mother or the sister of the father are identified with the father and the mother of the spouse, as the scheme opposite indicates.

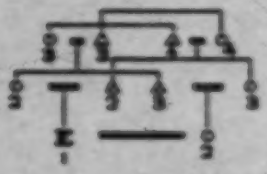

Fig. 1.

[19] Great-uncles (or aunts) thus use a new term to designate their grand-nephews (or nieces), connotating relatives to the fourth degree, while their descendants employ, to call them, the term already used in the direct line, but not yet in the collateral line, serving to designate relatives to the second degree. This last term serves thus, in direct line, to designate the third generation in line of descent, and the third ascending generation in collateral line, equivalent in descending line to the fourth degree. These remarks lead to the conclusion that the Nambikwara make no distinction between generations and degrees of kinship. A difference of one generation is to them equal to a removal of one degree.

That suggested, and within the same generation, all the individuals whom I call husband (or wife) are the sons (or daughters) of the "brothers" (blood or not) of my mother, and of the sisters (blood or not) of my father, that is, of the brothers of my mother (who are at the same time the "brothers-in-law" of my father), or of the sisters of my father (who are at the same time the "sisters-in-law" of my mother). And all the individuals whom I call brothers or sisters are the children of my father's brothers or my mother's sisters, that is, of the "wives" of my father (who are at the same time my "mothers"), or of the "husbands" of my mother (who are at the same time my

601 "mothers"), or of the "husbands" of my mother (who are at the same time my "fathers"). It is seen then that a given individual calls all his parallel cousins "brothers and sisters," and his parallel uncles and aunts "fathers and mothers", while he calls his cross-cousins husbands or wives, and his cross-aunts and uncles "father-in-law and mother-in-law" (identified with grandfather and grandmother, thus, more exactly: parents to the second degree). The confusion between gen-
601 erations and degrees thus makes equally possible the marriage of the
582 brother of the mother or of the father, to the daughter of the sister or of the brother, or of the sister of the father with the son of the brother, since, in these two cases, the parents-in-law will be the grandparents, called thus, by the term of parents to the second degree. These marriages, which we shall call "oblique," since they unite individuals belonging to two consecutive generations, are actually practiced.

601 Below is to be found the list of terms of relationship, as they have just been analyzed in their respective relations (Dialect A 1/2).

1. shuñuwa (a 1); shuñu (a2)..... father, brother of the father, husband of the mother's sister,
2. a'ihtowa (a 1); a2ihtowa (a2)... mother, sister of the mother, wife of the father's brother.
3. wiitu, wiitu ..... child.
4. a2kitaru..... son.
5. a2kihetu..... daughter.
6. akenatowa ..... older brother.
7. (i)oatowa ..... older sister.
[20]8. aiotu ..... younger brother, son of brother of the father, son of sister of the mother.
9. ari'adetu ..... younger sister, daughter of brother of the father, daughter of sister of mother.
10. aritowa ..... sister's husband, cross-cousin (masc.) (man speaking).
11. aneetatu ..... brother's wife, cross-cousin (fem.) (woman speaking).
12. ati'utu ..... sister's daughter (m. s.), brother's daughter (w. s.), son's wife.
13. atinoetu ..... sister's son (m. s.), brother's son (w. s.), daughter's husband,

601

14. asoðosu ..... father of the father or of the mother, brother of mother, father of spouse.

15. aʔeinosu ..... mother of the father or mother, sister of father, mother of spouse.

16. asuʔtu ..... son (or daughter) of the son (or of the daughter), brother (or sister) of the father (or mother) of the father (or of the mother).

17. asuʔlisu ..... son (or daughter) of the son (or of the daughter) of the brother (w. s.) or of the sister (m. s.).

18. asiɛtu (a 1); (tʌ) dosu (a2).. wife, daughter of the brother of the mother, daughter of the sister of the father.

19. ouɛtasesu (a 1): (tʌ)nosu (a2).. husband, son of the brother of the mother, son of the sister of the father.

The following scheme shows their utilization in this theoretic group:

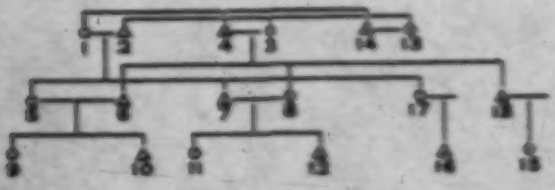

Fig. 2.

[60] As concerns a male subject E 10:

1- 3.	a²ɛ²nosu		
2- 4.	asoŭnosu	rec. :	asuirtu
13-14.	asuĭ'ttu	rec.:	asuɛ̆'tinu
5-17.	a²ke'nosu	rec.:	a²kiraru
6-18.	abu'nosu	rec.:	a²ki'taru
[21] 7.	asŏ'nosu	rec.:	asinɛ̆'ru
8.	a²ɛ'inosu	rec.:	asinɛ̆'ru
9.	ari'ndesu or (t)oŭnosu	rec.:	akenŭnosu or aldosu
11.	asi²tu	rec.:	oyɛ̆'nsaesu
12.	asŭkosu	rec.:	asŭkosu (if the subject chosen is e 9 woman, E12 will be oyɛ̆'nsaesu and e 11 asɛ̆'tasu, rec.: asɛ̆'tasu)
15.	ari'ndesu	rec.:	aldosu
16.	aldosu	rec.:	ari'ndesu

If one does not keep account of the reciprocal use of the terms, normally univocal, aldosu and ari'ndesu in the case of parallel cousins, this nomenclature only includes univocal terms, with the exception of two: asŭkosu and asɛ̆'tasu, and each sex has at its disposition only one of these two reciprocal terms; in other words, a man has only brothers-in-law, while a woman has only sisters-in-law. It will be seen below that as concerns the first term (asŭkosu), it implies particular relations between the men who use it.

The extreme simplicity of the system of course leads to some difficulties of nomenclature when one desires to distinguish degrees of parentage confounded by the system. In the same way its extreme symmetry risks bringing about contradictions when "oblique" marriages bring transfers between generations. To the classificatory nomenclature analyzed above is superimposed--or added--a descriptive nomenclature, which permits, in case of difficulty, placing the individual in the generation with more precision, or according to the degree of kinship which he holds with respect to the subject. This descriptive [55] nomenclature is not currently used, and above all, it never intervenes in naming. But it is consulted each time there is some doubt, and in some cases more frequent usage can be pointed out.

The first difficulty might be produced concerning the distinction of the real husband or wife, compared to the theoretical husbands or wives, or of the true father or mother compared to the theoretical

601 husbands or wives, or of the true father or mother compared to the theoretical "fathers" or "mothers," or of true sons or daughters as compared to theoretical "sons" and "daughters." In most cases, the discrimination seems totally superfluous to the Indians, since it is so well accented by the differences of behavior. Sometimes also it seems useless because of the inverse of the preceding, the theoretical wife can become a real wife (for example in case of polygamy, or of remarriage), the theoretical father or mother, or the theoretical son [608] or daughter, can play the role of true father or mother, or of true son or daughter, through the mechanism of adoption. This functions automatically, in the case of the father's death, the child then being [22] [768] taken in and raised by its father's brother. In this case his father's brother, whom he has always called father, becomes for him a real father even though by substitution, and the wife of his father's brother, who is most often his mother's sister, and whom he has consequently always called mother, is from then on treated by him as such, especially if his own mother is dead or has remarried. However, sometimes the Indians wish to sharpen the theoretical character of the name. Then they add to the classifying term a descriptive term, whose approximate meaning is that of "relative" in the most general sense, as,

20. (akit) ʃidniu,

used in the substantive form: above, or in the participial form ʃidnere; or in the exclamatory form, in conversation, ʃidneram.

Thus we have found the following appelations,

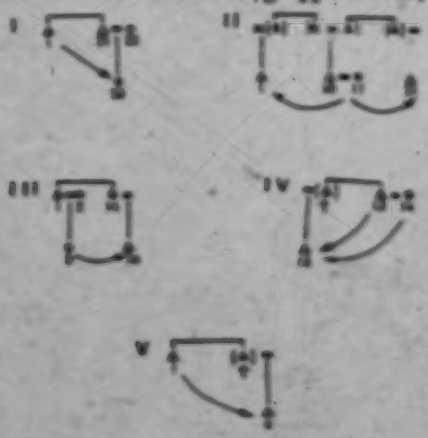

Fig. 3

I. aʃkineru aʃidneram. --II. (t)oyensaeru ajdniu. III. oyensaeru ajdniu (among children). IV. tayettu aʃkiraru ajdneram. --V. akineram (aʃkirara ajdneram).

601 A second difficulty comes up in the designation of parallel cousins. It has been seen above that the same name is used for them which designates the younger sister or the younger brother, whatever their age may be. This [23] usage suggests that the adequate translation of the terms aldosu, akenasosu, arĩndesu, (t)oasosu could be, rather than "elder" and "younger," big brother, big sister, little brother, little sister, with the same ambiguity that exists in our language between the real sense of the adjective and its figurative sense. Be that as it may, one often comes up against a contradictory situation, not only objectively (which does not shock Indian logic, as will be seen in the case of "mothers" younger than their "sons"), but also literally. This is what happens when for example, a woman calls a female cousin arĩndesu who is quite obviously her elder. Then one has recourse to two supplementary terms, sometimes added to classifying terms, but also sometimes replacing them, even when it is a question of designating blood brothers or sisters. These are:

21. tog-nosu : "elder" (to designate a man);

22. tostadosu : "elder" (to designate a woman).

These terms serve to sharpen the respective position, regarding the generation, for those who are:

23. arĩndesu, or

24. aloneõndesu,

that is, "one as regards the other of the arĩndesu," or "the aldosu," which is not permissible in certain instances; while two women can be without difficulty:

25. asetseõndesu

or two men:

26. asukuõndesu,

that is, "the one for the other," asuõtasu or asuõosu. Thus we have found women who call their parallel cousins arĩndesu tostadosu, meaning, "my elder little sister."

601 Other difficulties appear in the case of oblique marriages. When
612 the mother's brother marries the sister's daughter, the woman's grandparents are at the same time the husband's parents. When the husband marries one or several daughters of his wife's sister, his own parents are simultaneously the parents-in-law and the great-uncles of his wives. Thence the frequent necessity to differentiate more precisely than the classifying terms permit between mother's and the father's sisters, on one side (that is the potential parents-in-law), and the fathers and mothers of the father and mother (that is the eventual
601 parents-in-law of one of the spouses). The [24] following terms, then,

601 are found which complete (or substitute for) the classifying terms a2ɛ̃nosu, asoũnosu, ahũ̃nosu, a2kẽnosu:

27. arĩ̃ndagresu : "mother's mother";
28. oyensẽrosu : "mother's father";
29. aseẽtagresu : "father's mother";
30. alũ̃narusu : "father's father";
31. a2ɛ̃ndagresu : "sister of the mother's mother."

The etymology of the terms verifies the principal of marriage of cross-cousins. In fact, if one has:

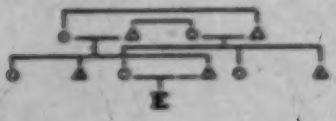

Fig. 4.

it is established that:

arĩ̃ndagresu (or arindakerosu, "little old sister"), is the sister of my father's father;

oyensẽrosu (from oyẽnsesu, "husband") is the husband of my mother's mother;

aseẽtagresu (or aseẽtãherosu, "old sister-in-law") is the sister-in-law of my mother's mother;

alũ̃narusu (from alũ̃su, "brother") is the brother of my mother's mother.

Concerning uncles and aunts, their name is sharpened by descriptive terms:

32. akãjõagresu, atãkarusu: "mother's sister";
33. akaterosu : "mother's brother";
34. agãdnosu : "father's sister."

No descriptive term has been found for the father's brother, normally [768] called father (ahũ̃nosu): perhaps this lack is to be explained by his position as father in case of the blood father's death.

On the other hand, the following descriptive terms have been collected in the course of attempts at genealogical reconstruction, but it was not possible to determine for certain the levels or degrees of parentage to which they refer. It is possible that they are employed jointly with certain of the preceding terms:

601 35. tarũtarosu : "old brother-in-law" (tarũte [b 1/2] equals asũkosu [a 1/2]);

36. tuĩtarosu : "old husband" (uĩte [b 1/2] equals oẽhsaesu [a 1/2]);

37. ianẽhosu : ?

38. asoũkerosu : "old grandfather" or "father-in-law";

[25] [764] 39. takaʔkenosu cited with the commentary : "When the takaʔkenosu dies, the alõhsu cut their hair, but not the akenẽhosu."

Finally, two terms of relationship express the relations coming from "oblique" marriages and from the division of generations into "elders" and "younger":

40. ajũhkedisu;

41. (t)ãdirikisu.

A man calls the akenanosu of his mother ajũhkedisu (while the term asoũhosu is generally—but not always—reserved for the alõhsu); one and the other are, of course, the asũkosu of his father. The same individual is then called "father-in-law" (asoũhosu) or "husband" (oẽhsaesu) by the sister of the subject considered, or, if she is married, ajũhkedisu also, the husband then calling him "father" (ahuĩhosu). One sees then that the ajũhkedisu is a man whose daughter or wife I (masculine subject) marry, and whose son my sister marries, if she does not marry the man himself. Thus it is explained that the ajũhkedisu is asũkosu or asoũhosu, to my brother; asũkosu or asinẽtu, to my father; akenẽhosu or asinẽtu, to my mother; oẽhsaesu or asoũhosu, to my sister; ahuĩhosu, to my wife.

On the other hand, a man calls a woman (t)ãdirikisu who can be arũndesu or asintu of his father, asẽtãsu or asĩnãsu of his mother, asẽtãsu or aʔõhosu of his sister, asẽkẽhosu of his wife. She is then a woman whom I marry or whose daughter I marry. A woman, in her turn, calls another woman (t)ãdirikisu who is aʔkẽndesu of her husband, that is, a woman whose brother or son she marries.

601 382 One sees that these two names bestow two privileges, or opens a double right: that of the marriage of the mother's brother (and, theoretically, of the father's brother) with his niece; a right belonging essentially to the elder brother; and of the marriage of the sister's son (brother's son) with his aunt. This rule, or rather this possibility is explained on the one hand by the tendency of the Nambikwara towards polygamy, on the other hand, by the scarcity (moreover consecutive) of women. We shall study examples in an instant.

● 401

Fig. 5.
Left equals ajũnkedisu; right equals t(i)dirikisu.

[26] In the nomenclature of the terms utilized for the description of relationships of parentage, we shall cite again:

42. aiũkesu (a 1/2) genetere (b 1/2): "widower, widow."
43. koaade (b 1) : "orphan (masc.)";
44. koadare (b 1) : "orphan (fem.)".

• • • •

As we have just seen, the terms ajũnkedisu and (t)dirikisu appear as tentatives for the solutions of ambiguous situations coming from an oblique marriage. These are only partially successful, since my parents always have the possibility of interpreting, in two different ways, their relationship of parentage concerning my ajũnkedisu or my (t)dirikisu. Most often, these ambiguities are left without solution, or else one of the two following phenomena happens: each member of the family interprets his relation to the doubtful relative in the way easiest for him, without worrying about the fact that the different names in use might appear grossly contradictory; or else the relative—or the bloc of relatives—in doubt are shifted by one generation or by one degree of proximity as a means of rationalizing the structure. These difficulties appear especially in the case of polygamous unions. These are generally realized in the form of an encroachment of one or several women belonging to the younger (génération inférieure) generation than the one into which they should have—sometimes already have—married normally. Here is a striking illustration, where the complexity of relationships to the younger generation follows an oblique marriage to the older generation.

●601

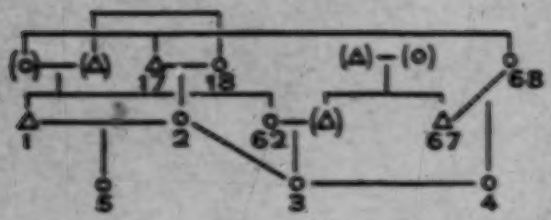

Fig. 6.

This is what happens: A1 married his cross-cousin a2, by whom he has a little daughter a5. Later on, he married two young women: one (a3) whose father is dead; the other, a4, whose father was the brother of the father of a3 and was called "husband" by a2 who also called the mother of a4 "sister-in-law." This established, a4, and a3 are, for A1 and a2, "daughters" or "daughters-in-law." Since A1 married them, they have become, by promotion:

For a2, "little sisters" (arñdeem);

[27] For a5 (for whom they should normally have been sisters or sisters-in-law), "mothers" or "mother's sisters";

For A1, wives.

And while his wife a2 continues to give to the parents-in-law of her husband the old name of husband (oatnaem) and of sister-in-law (aneetam), he now calls them parents-in-law, that is aoothoeu and a2[illegible]noeu.

Another case presents the following combination:

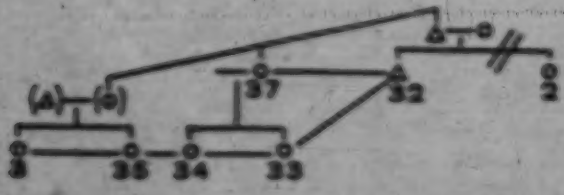

Fig. 7

601
582 A man marries a woman and subsequently her four "daughters" (probably two blood daughters from the preceding marriage, and two parallel nieces). In this case, a2 calls the older wife a2eŋosu, and the four young ones aseetasu, from which one can conclude that A32 has married at the same time his (t)ɨdirikisu and the latter's daughters.

Finally, in this third case:

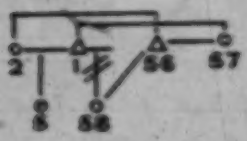

Fig. 8.

Normally, a2 calls a57 aseetasu (wife of her brother), but she disregards the fact that a58 is in the same situation, and keeps for her the name which she gave her before her marriage to A56, of tayɛttu (my child, daughter of her husband). Her own daughter a5 normally calls a57 a2eŋosu (wife of the mother's brother), and a58 tosinsu (older sister), however, she could marry and call the son of her "mother-in-law" husband as well as the son of her "sister."

Thus the Indians treat abnormal situations resulting from polygamous unions in two ways. Either they admit the creation of a new situation and bless it by revising the names (the newly-married wives are promoted to the class of "mothers," and their parents to the class of [28] "parents of the third degree"; the women are then separated in nomenclature from their former brothers, sisters, sisters-in-law and husbands, who become sons, daughters, daughters-in-law and sons-in-law); or else the former names are simply preserved, the practical knowledge of the situation supplanting the impropriety of the language.

601 But these uncertainties, which appear in the case of verbal contradictions, are completely absent in the presence of real contradictions. These latter are admitted as normal consequences of the system, or more exactly, they are not considered as contradictions. Thus:

●601

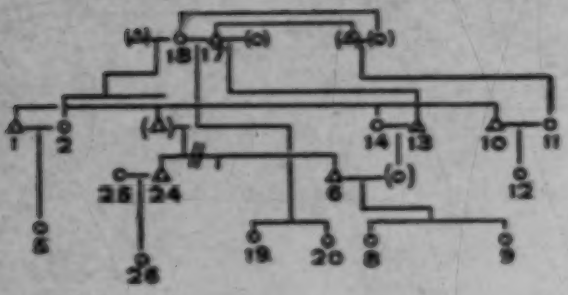

Fig. 9

A17, a man of about 55 years, married a18 (about 50 years) and has by her two daughters, a19 (about 12 years) and a20 (about 6 years). a18 has from a former marriage, a daughter a2 (about 30 years) married to A1 (about 35 years); the latter has taken a son A24 from an older dead brother; this son, himself married and the father of a baby, is about 26 years old. A17 and a18 are then "asoinosu" and "asoinosu". The daughter a2 of a18 is a "asoinosu," mother of a daughter of 8 or 9 years, a5. Under these conditions, the two little girls a19 and a20 are likewise "mothers," and they are called "asoinosu" by:

a5 : their contemporary [feminine];
A6 : their elder [masculine] (about 25 years);
a12 : their elder [feminine] (about 22 years);
A24 : their elder [masculine] (about 26 years);

and consequently they are called "grandmother" by:

a8 : their contemporary [feminine] (about 6 years);
a9 : their junior [feminine] (about 3 years);

the daughters of A6; and, in fact, a2, who is a "mother," normally calls them "little sisters."

601 184 [29] The system of parentage of the central, southern, and western groups (dialects b 1 and b2) does not present any fundamental difference as concerns the preceding. The degrees of parentage distinguished are less numerous; on the contrary, one finds quite a great variety of terms used to designate a set degree. The fact that the informants use several terms to qualify their situation as concerns a certain subject suggests that these terms are often synonyms, even though their etymological sense is not always perfectly clear.

601 184 Grandparents are most often singled out among themselves, and distinguished from the parents of the spouse, which does not happen in system a (1 or 2); also, the son (or daughter) of the brother (or the of the sister) of the father (or of the mother) are sometimes designated by different terms. The groups studied are not dense enough to be able to make a base for a theory of the system in force. Solutions of replacement intervene frequently, and the preferential forms of marriage found are not adequate for generalizations, due to an insufficient number of cases. But the preceding considerations suggest that preferential unions, choosing also among certain categories of cross-cousins, could formerly have been in force. [512]

Finally, the names for brothers (and sisters), elder and younger, are more changeable than in system a (1 or 2); and one sees appear a new term designating the brother or the sister of the other sex. This disorganization of vocabulary can be interpreted as resulting from the influence of the northern system (dialect c), where we shall see later on that it tends more and more to assimilate the system of groups b. [17]

Here is the vocabulary of parentage used, with references to group a (1/2): [Note: m. s. = man speaking; w. s. = woman speaking; m. w. s. = man or woman speaking.]

Dialect a 1/2		Dialect b 1/2	
ahuĩnoxo	1.	(ta)mĩ'hde	(my) father, father's brother.
	2.	ẽ'hde	father (equals man).
	3.	uĩ'ye	father (used to designate absent father, or father of a third person, or the father's brother.
	4.	(ta)mĩ'hiaore	father's brother (equals other father).
	5.	(ta)mindzãinere	father (father's brother when he substitutes for dead father).
a2ĩnoxo	6.	(ta)nãde	(my) mother, mother's sister.
	7-8.	(ta)nãdeiaore, nãdere	mother (other mother; for the mother's sister and the mother of a third).

601
184

	9.	denaddnere	mother (wife of the father's brother, cf. 5)
[30] nettu	10.	nette	child.
	11.	namade	small child, baby.
a?kitaru	12.	akitaende	son.
	13.	dingire	son (= little man).
	14.	alkiladdnere	son (used by the father's brother to the brother's son).
a?kitheru	15.	itikeninde	daughter.
	16.	dedingire	daughter (= little woman).
	17.	inkaniddnere	daughter (adopted).
(t)oathoru	18.	toatde	older sister.
	19.	kirdnde	older sister (?).
arithderu	20.	(t)oaniqinitkare	younger sister.
	21.	alitnde	brother or sister of opposite sex.
akeathoru	22.	(t)ouatde	older brother.
akitaru	23.	(t)akaaade	younger brother.
aitem	24.	(t)ette, adoette	(my) spouse, wife.
oathaeru	25.	(t)gitde	(my) spouse, husband.
	26.	etende	husband (= main man).
	27.	gitdere	husband (when he is absent, or the husband of another).
aathoru	28.	(t)atute	cross-cousin (masc.), sister's husband (m.s.).
aaetaru	29.	(ta)dédere	cross-cousin (fem.), brother's wife (w.s.).
aiaadtu	30.	(t)qizare	sister's son, daughter's husband (m.s.).
	31.	(t)-qinitde	brother's son, daughter's husband (w.s.).
	32.	(ta)qitde	daughter's husband.
aitaru	33. gitdare 34. qitnde		brother's daughter (w.s.), sister's daughter (m.s.) son's wife.
aaethoru	35.	adakqitde	
	36.	(ta)kotde	mother's father, father of spouse.
	37.	[illegible]otnde 38. (ta)[illegible]tde	father of father or of the mother.

601 184

alʔihosu	39.	hiʔitde	mother of spouse.
	40.	ʔitde	mother of the father or of the mother.
asuʔitu	41.	asuʔte	son (daughter) of the son (or daughter), sister of father (brother of mother) of father or of mother.
asuʔitsu	42.	asuʔarore	children of the son or of the daughter of the brother (w.s.), children of the son or of daughter of the sister (m.s.).

[31] Descriptive terms:

	43.	uʔikuajade	44. (ta)nitdinere... child of a third person, adopted child.
	45.	iodte	adolescent. (masc)
	46.	tiʔdte	adolescent. (fem.)

(For orphan, masculine or feminine, widower, widow, see above, p. 26.)

• • • •

We go now to the system of parentage of the northern group (dialect C):

1.	uʔiko	father.
2.	hʔini	father's brother.
3.	niʔko	mother, mother's sister.
4.	asiʔaha	father's sister.
5.	hoʔko	mother's brother, father of the spouse, father of the father or of the mother.
6.	hiʔno	wife of the mother's brother, mother of the spouse, mother of the father or of the mother.
7.	tasʔa	son, sister's son (w.s.), son of a "wife" (m.s.).
8.	tasʔero	daughter, sister's daughter (w.s.), daughter of a "wife" (m.s.).
9.	niʔno	son or daughter of the sister (m.s.).
10.	tsʔenero	son or daughter of the brother (w.s.).
11.	iʔio	older brother or sister.
12.	ihiʔini	younger brother or sister.
13.	iʔtsa	wife, daughter of the father's sister, daughter of the mother's sister.

681
184

14. tiimo..... husband, son of the father's sister, son of the mother's brother.
15. iɨpa..... sister's husband, wife's brother (m. s.).
16. iɨtta..... brother's wife, husband's sister (w. s.).
17. iɨaɨtte..... daughter's husband, (f. p.), daughter's husband, "wife's" husband (m. s.).
18. iinaɨo..... brother's daughter (w. s.), sister's daughter (m. s.), when she is at the same time wife of the son (m. w. s.) or wife of the younger brother (m. s.).
19. iiɨɨ..... daughter's children.
20. ioɨo..... son's child, or of the daughter when the latter is married to an uncle.
21. aɨa..... child (married to an uncle).

[32] This vocabulary of relationships apparently does not offer any affinity linguistically with that of dialects a and b; and the structure of the system also seems different. Without doubt the fundamental principle--the marriage of cross-cousins--remains the same. To be convinced of this, it is sufficient to refer to the list of relatives designated by the terms tiimo and iatta. Again one finds the division of members of the same generation into sisters and wives (m. s.), or brothers and husbands (w. s.) on one side, and on the other, sisters and wives of brothers (w. s.), or brothers and husbands of sisters (m. s.). But the distinction here is more confused, since it is accompanied by an absence of symmetry concerning the designation of the brothers and sisters of parents, and the children of the brothers and sisters of the subject. Instead of finding the first divided into fathers and mothers, fathers-in-law and mothers-in-law, and the second into children, and sons-in-law and daughters-in-law, we have a more complicated terminology. The name of the father's sister (aɨɨtaba) differs from that of the wife of the mother's brother (iiɨo), although they are habitually confused in a system of marriage among bilateral cross-cousins. There is also a special name for the father's brother. But, if this latter is a younger brother who has one of his nieces, he will be called brother-in-law (iɨpa) by his brother's son, his nephew. Even more delicate is the naming of nephews and nieces because the symmetry carried on by the other systems between the children of brother (of a brother) and the children of sister (of a sister) fades out giving way to a new symmetry, this time between the children of sister (of a sister), and the children of the wife (classificatory) of the brother, who are called by the same name. Moreover, the children

601 born respectively from a brother and from a sister receive different
184 names according to whether they are the sons or daughter of a brother
(of a sister), or sons or daughter of a sister (of a brother). Finally,
it is no longer normally possible to identify the son-in-law (hapʷtu)
and the daughter-in-law (pinaʔio) with the nephew or the niece
(cross-), and the hiuñi, soʔko (the same difference as the aŋiʔtu,
aŋiʔtu, and aŋelisu or aŋiarore of the preceding systems) do not
correspond exactly to relatives of the third generation, or to the
third degree.

601 These contrasts are clarified when one studies the forms of mar-
184 riage actually practiced. Of eight marriages, five are "horizontal,"
582 that is uniting a husband and wife coming from the same classificatory
generation, and three are "oblique," the husband coming from the
generation of his wife's mother:

C1 • c2 : brother's son and sister's daughter (horizontal);
C4 • c5 : husband's brother and wife's sister (horizontal);
C6 • c7 : mother's younger brother and sister's daughter (oblique);
C12 • c13 : mother's older brother and sister's daughter (oblique);
C16 • c17 : mother's younger brother and sister's daughter (oblique);
C20 • c3 : husband's sister and wife's older brother (horizontal);
C20 ▲ c21 : husband's sister and wife's older brother (horizontal);
C29 • c28 : brother's son and sister's daughter (horizontal).

[33] In the absence of genealogical facts, one can even suppose that two of the marriages above, classed as "horizontal," are probably oblique, given the considerable difference in age between the husband and wife (C20 • c8, c21); such is often the case of children issued from "oblique" marriages. But even disregarding this possibility, the proportion of "oblique" relationships rises when one passes from marriages as such to the classificatory relationship of husband and wife. Thus C6, for example, calls "wife":

c2 : wife's sister;
c5 : sister of father's wife;
c7 : his own wife;
c8 : sister of father's wife;
c13 : wife's sister;
c17 : wife's sister;
c21 : sister of father's wife;
c26 : wife's sister;
c31 : wife's sister;

there are actually three horizontal relationships and six oblique (directly or indirectly, through the already oblique position of the intermediary).

We have seen above that the "oblique" marriage is not unknown in the eastern, central, southern and western groups. But it is not so frequent there, and above all, the system of names does not take account of it. The problems resulting from this form of marriage are, then, resolved in two ways: either they preserve the names which have become contradictory, or they displace one or several individuals from the category of kinship to another. The method of the northern system is entirely different, for this is the system whose structure is accommodated to marriage between persons of different generations. (1) This new character is shown by a clearer distinction,

601 ● 582 134

1. For the theoretical interpretation, it will be compared with the Miwok and Ao Naga systems, as we have analysed them in another work. (Les structures élémentaires de la parenté, ch. 17 and 22.)

within each generation, between the "elder" and the "younger"; in place of four terms distinguishing the relative age and sex, there are only two, ĵéla and sabéhi, which refer to age and apply indifferently to both sexes. Moreover, the term sabéhi tends to have the general meaning of "young" or "little," and succeeds in specifying, from this point of view, whatever the kinship relationship is (2) implying

2. Cf. below, p. 37, text No. 1.

thus that the quality of sabéhi is equivalent to displacement to another generation. And actually, even though the older brother and the younger brother can equally claim to marry their sister's daughter, the older brother, even when married to his niece, will continue to be called ĵéla by [34] his wife's mother. On the other hand, in the same situation the younger brother sometimes passes to the rank of ĵiaũ'tte; he is no longer considered as a brother, but as a son-in-law. Moreover, if the term ĵiaũ'tte normally means a "horizontal" son-in-law, that is a cross-nephew married to a daughter, it is significant that a man calls ĵiaũ'tte his younger brother, who has married a niece, and even a "wife"; and that a woman designates a younger brother married to a daughter in the same way, as has just been seen. Nevertheless, a man calls his cross-cousins (fem.) and his sisters' daughters indiscriminately ĵétta (wife), while distinguishing the husbands of his "wives" as ĵiaũ'tte (horizontal son-in-law), sabéhi (or ĵiaũ'tte, replacing sabéhi) and ĵéla.

601 It might be considered that these differences as regards the other systems are purely formal. They bring on, however, some important consequences. The preferential marriage between mother's brother and sister's daughter must introduce asymmetry between the children of the brother and those of the sister, thus justifying the use of different names in the two cases. For the same reason, one sees a shift of a classificatory generation appear between a woman who has married an uncle, and that of her parallel cousins. Here is a striking example:

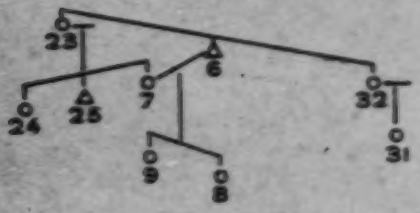

Fig. 10.

c23 calls C6 (in reality, sabãni) ĵiauĵ'tte; thus her daughter c24 calls him tiĵ'mo (husband), since he is married to her sister, c7, and their brother C25 calls him jopa for the same reason. For c23, her granddaughters (and nieces at the same time) c8 and c9 are ĵiuĵi, called tattero by the sister of the mother c24, and aiĵinu by the brother of the mother C25. But if one looks at it from the point of view of c31, the essential fact is not, as in the preceding cases, that C6 has married a daughter or a sister (here, a niece or a parallel cousin), but that he is the mother's brother. Consequently, she calls him koo'ka (father-in-law), and she calls the wife of C6 ĵiĵ'ko (mother-in-law), and the children of the latter become her ĵiuĵ'tta (sisters-in-law).

A double conclusion can be drawn from this analysis. In the first place, it must be remembered that in systems a and b the term for "older brother or sister" also means parallel cousins. Now we have just established that in the system of group c the parallel cousin can actually be displaced to a younger generation, and that such is the case when the marriage is of the "oblique" type. It may, therefore, be that the oblique marriage has occupied a more important place in systems a and b than is the case today. The second point is that the kinship system of group b, with its use of a special term for the brother or sister of the opposite sex, and its distinction [35] between the parents of spouses and the grandparents, takes an intermediary position

601 between systems a and c. It constitutes a sort of transition between 582 the simple, symmetrical and harmonious system of the eastern groups 187 and the more subtle and complex structure of the northern system. This role corresponds well to the respective geographic positions occupied by the different groups.

CONCRETE STUDY OF THE GROUPS

601 The concrete functioning of the kinship systems previously analyzed has been studied in the following groups:

I. Eastern group (dialects a).

621 (1) Dialect a 1. —A group of 23 individuals composed of six men, nine women, and eight children. This group was found to be temporarily enlarged by the meeting, and sometimes even the temporary combining of bands, whose members present among themselves, and as concerns the first group, analogous kinship relationships. Thus, group (1) was found to be temporarily increased to the point of including 75 individuals (20 men, 30 women, and 25 children).

(2) Dialect a2. —Several small units each including 6 to 12 individuals.

II. South-central group (dialect b1).

A stable group of 17 individuals composed of five men, six women and six children, temporarily increased, by the meeting with relatives, to 31 individuals (13 men, 10 women, and 8 children).

III. Western group (dialect b2).

A group of 12 individuals composed of four men, five women, and three children.

IV. Northern group (dialect c).

A stable group of 34 individuals composed of 9 men, 11 women and 14 children.

128 The concrete study of the groups will be based on the eastern 114 group a1 (restricted) and on the central group b1 (restricted), the only ones with whom we have lived long enough to set forth a psychosociological analysis.

55] 124 names of the adults without too much difficulty. When the latter found out our secret meetings, the children were harshly reprimanded, and the source of our information cut off. However, during a moment of great confidence one day, A1 gave us the names of her parents and great-grandparents, so that at the end of the account the list of proper names covers a total of five generations:

55] 60] 1. Mother of the mother of A1 ..... Arigñladusu.
2. Father of the father of A1 ..... Irñtilisu, Irñgudusu.
3. Mother of the father of A1 ..... Etuadgingisu.
4. Father of the mother of A1 ..... Igiñkulusu.
5. Father of A1 ..... Arakñladusu.
6. Mother of A1 ..... Tuyuñtusu.
7. A1 ..... (missing)
8. a2 ..... Gñendereru.
9. a3 ..... Uñterekaneru.
10. a4 ..... Uañtakaneru.
11. Mother of a4 ..... Uañtasu.
12. Father of a4 ..... Nisuañtusu.
13. a5 ..... Gñendereñkineru.
[39] 14. A6 ..... Tairiñu.
15. a7 ..... Nariñu, Niãniñkinere.
16. a8 ..... Tairiñkineru.
17. a9 ..... Tairiñkineru.
18. A10 ..... Niñkloerekinẽdetu.
19. a11 ..... Seliñitirokañsu.
20. a12 ..... Seliñitiñkineru.
21. A13 ..... Tareñakaresu.
22. a14 ..... Njoñelese.
23. A15 ..... Nikñkitasu.
24. A16 ..... Njoseleñekiraru.
25. A17 ..... Kañkaresu.
26. a18 ..... Sonañakaresu.
27. a19 ..... Sonañakaneru.
28. a20 ..... Sonañakariñkiritasu, Kjatoreñkineru.
29. A21 ..... Karloñeru.
30. a22 ..... Itañiñẽdetu, Idonereñkineru.
31. a23 ..... Kjedikitasu, Kuẽtitõdesukineru, Karloñkineru.

601
621

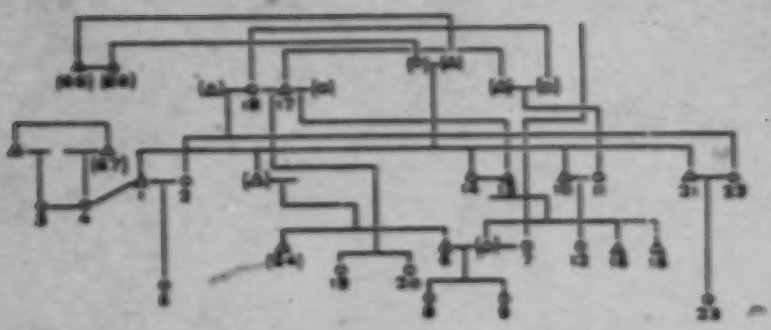

Fig. 11.
Genealogical composition of group a1.

622 A1. --The chief of the group. He is a man of about 35 years,
115 married to three women: a2, by whom he has a daughter a5, and
157 a3 and a4, both daughters of "sister," without child.

A1 is remarkably intelligent, conscious of his responsibilities, active, enterprising and ingenious. When we went to visit his village, he did not hesitate to follow a new itinerary, unknown to him, because our horses could not pass along the habitual path. And when we arrived at the village, we found the stakes necessary to tie our oxen and horses, which he had had set up by a party sent a few hours ahead of time.

His attitude concerning writing is very revealing. He immediately understood his role of signing (1), and the social superiority which it

531
212

1. The Nambikwara of group a are completely ignorant of drawing, if one excepts a few geometric tracings on gourds. For several days they did not know what to do with the paper and pencils which we distributed to them. A little later, we saw them deeply engrossed in tracing wavy lines. In doing this they were imitating the only use which they had seen us make of our note pads, that is, for writing, but without understanding the purpose and significance.

1: Lévi-Strauss--56 E-5 (1938-1939)1948 SP17 Nambicuara SP17

we shall
[621] comment later (1) on the complex motives that might have induced

1. Cf. p. 77.

[147] these two bands, speaking different dialects and who were not even capable of understanding one another without an interpreter, to practically merge. It seems that group b1 was composed of the rare survivors of a formerly important formation now disappeared, living previously in two distinct groups, around the sources of the eastern tributaries of the Roosevelt River. We have already tried to calculate these losses, resulting from recent epidemics (2). Group c had,

2. Cf. above, p. 6.

without doubt, gone through the same hardships. Moreover, its [578] position had been compromised by antagonisms with other bands rising from the same dialect, and who had formerly been their allies. A visit, with a commercial goal, of related Indians originally from the south (members of the group known by the name of Kabixi) must have raised the forces of group b1 to 31 persons for [621] several days. Here is its composition at this moment:

115 Fire 1 (1 to 7). --The family of the chief of the band. The
157 chief, B1, is 30 to 35 years old, and one of the most intelligent
622 Indians whom it was our privilege to encounter. But he is intelligent
● 601 in a way very different from A1. The latter is prudent and very resourceful, always meditating some political combination. On the contrary, B1 is not a man of action, but rather contemplative, with a charming and poetic spirit, and rich sensibilities. He is fully conscious of the inevitable decadence of his people, and this conviction often shades his words with a subtle tint of melancholy:

(4) joãmditn?ẽ . niãnaine hẽni niho ãmdednjẽn. (b1)

"I also did the same thing, now it is finished," [51] he says, remembering happier days when his group, far from being reduced to a handful of individuals incapable of keeping alive their traditional customs, was comprised of several hundreds of participants faithful to all the manifestations of the Nambikwara culture. His curiosity toward our customs and towards those which we had been able to observe in other tribes is just as great as ours. With him, ethnographic work is never unilateral. He conceives of it only as an exchange of information, and what we bring him is always very welcome. Often [77] he even asks us for—and preserves carefully—drawings representing

621 feather ornaments, hair styles, arms, such as we have seen among
115 neighboring or faraway peoples. Did he entertain the hope of per-
157 fecting the material and intellectual equipment of his group thanks
622 to this information? It is possible, even though his dreamy tempera-
177 ment hardly ever drives him to realizations. However, one day when
601 we were interrogating him concerning the Pan pipes, to verify the
area of diffusion of that instrument, he answered that he had never
[538] seen any, but that he would like to have a drawing (different from
group a, group b does not have real pipes of Pan, but instruments
made of two or three tubes of equal length and giving approximately
the same note, tied together with cotton thread and wax). With the
aid of our sketch he succeeded in making a crude but usable instru-
ment.

621 B1 had two wives: b2, about 25 years, mother of two little
601 girls of 5 to 7 years, b4 and b5; and b3, older than he (about 40
years old), mother of a boy of 7 years, B6, and of a girl of 9 years,
b7.

Fire 2 (8 and 9). --A son of a deceased brother of B1, whom the
latter then calls "son" (about 25 years old), and his wife about 18,
sister of B13; no information about the father and mother.

Fire 3 (10 to 12). --B10 is a brother of B8, and B1 calls him "son"
also. His wife, b11, of undetermined parentage, is about 20 years
old, and his daughter b12 about 6.

Fire 4 (13 and 14). --This household presents the only sure case of
oblique marriage in group b1. B13, about 25 years, married a girl
of 16 or 17, b14, daughter of a dead son of the dead brother of B1;
he calls her then, as seen before, tasuite.

Fire 5 (15 to 17). --These three individuals are the last survivors
of a related group destroyed by an epidemic. After the disaster,
they joined the band of B1. B15, about 35 years, is the brother of
b2, thus tasuite of B1. His wife, the same age, b16, is a sister of B1,
thus ndedere of b2. Their son, B17, is about 5. The daughters of
B1 call him (B17) "husband," and he calls them "wives."

621 [52] The visitors. --They came from the region lying between
574 the sources of the tributaries of the left bank of the Juruena and of
601 those of the right bank of the Guaporé. All were related to their
hosts, and were distributed among three generations. The oldest was
comprised of three individuals: B18, about 50 years old, father of
B21, B25, B27, and B29; his wife b19, the same age, paternal aunt
of B1; and the brother of the wife, B20, 40 years. Besides the
children of B18 already mentioned (from 20 to 30 years old), the next

621 generation is composed of b26, wife of 825 (about 20 years); of the
579 husband of b29, 828 (about 23); of the wife, b22, of 821 (same age);
601 of his brother 824 (20 years), both children of a deceased sister of
818; and of a widower of about 40 years, 830, brother of 815 and of
b2, who had been married to a sister of 81. The young generation
is represented by only two children, b23, about 7 years, daughter
of 821 and b22, and b31, about 10 years, daughter of 830, mother dead.
For the whole picture of genealogical relationships, the reader should
refer to Figure 15.

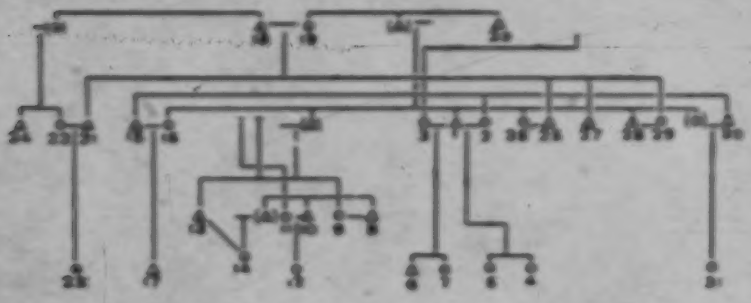

Fig. 15.

601
621

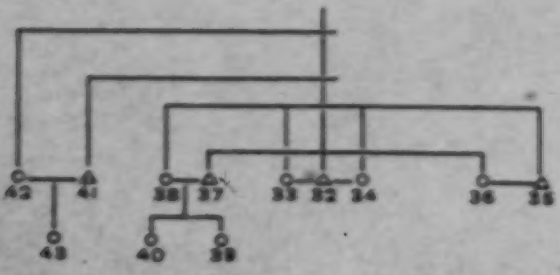

Fig. 16.

621 [53] Western group, dialect b2: tajate, lakondé (b1/2): sogaïtse (c).
601

We shall limit ourselves to giving the genealogical scheme of the composition of this little group (Figure 16), found, only for several days, toward the line of the division of the waters which separate the basins of the Roosevelt and the Gi-Paraná (Tres Buritis). Its members seem to be the survivors of a formerly important group, the tajte.

Northern group, dialect c: sabáne (c): tamaindé (b1/2): toúkoro (a 1/2).

[54] We have not been able to establish the genealogical composition of this group for reasons of linguistic difficulties (dialect c does not seem to spring from the same family as the others) and because of the consecutive impossibilities which we encountered in determining the true position in the system of individuals designated by the same term. We shall thus content ourselves with an analysis by households.

Fire 1 (1 to 3). --C1, about 30 years, and his wife c2, 25 years; he, "brother" of C6, she, "daughter" of c23; their son, C3, is about 10 years old.

Fire 2 (4 and 5). --C4, 40 years, is the younger brother of C20 and of c23; his wife c5, 25 to 30 years, is called "wife" by C6, "older sister" by c21, and "daughter" by c23.

Fire 3 (6 to 10). --We have already analyzed (1) the kinship

1. Pp. 33 to 35.

situation of C6, of his wife c7 (both are 30), and of their children c8 and c9 (6 to 8 years); the younger brother of the wife, C10, about 10 years, lives with them.

Fire 4 (11 to 14). --C11 is 50 odd years old; he is called "elder brother" by C6, C4, C15, C20, and c23; his wife c12, about 35 years, is "daughter" of c23; the young brother of the latter, C14, about 17 years, unmarried, lives with them as well as their daughter of 7 years, c13.

Fire 5 (15 to 18). --C15, about 30 years, is called "younger brother" by C20 and c23; his wife c16 is "daughter" of c23; she has a young brother C17, about 12 years, and a baby of some 20 months, c18.

1:Lévi-Strauss--48 E-5 (1938-1939)1948 SP17 Nambicuara SP17

601 621 [754] Fire 6 (19 to 22). --The chief, or rather, it seems, the shaman of group c, is 30 to 40 years old, "brother" of c23. His dispositions are friendly and mysterious. We shall encounter him farther on (2). He

2. P. 103.

has two wives, c19 and [54] c21, very pretty girls of 17 or 18 years, "sisters" of the dead husband of c23. Here we have, then, a good example of sororal polygyny. The second woman has a little boy of 3 years, C22.

Fire 7 (23 to 25). --The woman, c23, is over 40; she is a widow and seems to enjoy great consideration. Her numerous "brothers" provide for her as well as her children, and like C20, she is apt to receive supernatural revelations (1). She has a son, C25, about 14

1. Cf. p. 101.

years old, and a daughter, c24, about 10. Concerning them, refer to page 34.

Fire 8 (26 and 27). --A young couple of about 18, whose parents must be dead and whom the elders of the group call "grandchildren."

Fire 9 (28 to 30). --C28, about 25 years, is a "son" of C6; his wife, c29 is older than he (over 40); she is called "daughter" by c19 and c21, although they are by far younger than she; her daughter c30 is about 2 years old.

Fire 10 (31 to 33). --c32, about 40 years old, is a younger sister of c23; she has two daughters: the eldest, c31, about 17, is married; the younger, c33, still a baby. The husband and her son-in-law are absent; they are said to be on a trip together. The group sees to the needs of the two women.

[577] It is suitable to add a visitor to this list, C34, about 30 years old. He is the brother of c12 and, during his stay, he receives the hospitality of household number 4.

RELATIONSHIPS BETWEEN INDIVIDUALS

Husbands and Wives

593 To understand well the attitude of the two sexes as concerns one another, it is indispensable to keep in mind the fundamental character

462
463

like the women, but from the shoulder (adiuhitiu, al), and frequently lightening the load by dragging the strap in the left hand, which they explain by saying that they need to watch out for possible game. And they naturally do not neglect collecting and gleaning whenever the occasion is presented or necessity is felt. In like manner, the women normally aid their husbands (especially the polygamous wives) in their work in the gardens. Both sexes cut down wood, the men for constructing huts or shelters and for making bows, arrows, spears and clubs, etc., and the women, more often, for the fire wood. Above all, and when she is not occupied by her own work, the woman aids her husband in all the tasks that are his. She holds his implements, gives them to him when he asks for them, supports the end of the arrow or the wood of the bow while he repairs or polishes them, or begins to twist the cord while he finishes the wooden part. She does the retouching and finishes the work. This frequent and always harmonious collaboration gives the impression that the sexual division of labor is much less strict among the Nambikwara than it is commonly, and sometimes one might even think it non-existent. This is not so; but the rule is constantly made flexible or masked by the unity of the couple.

601
602

As we have shown in studying the kinship system all the classificatory contemporaries of an individual belonging to a different sex are divided by him into husbands and wives, and brothers and sisters. We have found no term which designates the actual spouse, and allows one to distinguish him in conversation from the classifying spouse. A man calls his wife or wives, and his cross-cousins (fem.) indiscriminately asiekis, as the woman designates her husband and her cross-cousins (masc.) by the same term cumaaesu. But, of course, behavior is very different in the two cases. It has just been seen to what extent relationships are close and active between true husband and wife. As regards his potential wives, a man does not adopt any particular attitude, and the relationships do not seem to be either [59] [Table: Sexual Division of Labor] more or less intimate than those which he carries on with his sisters (the same remark is true as regards the relationship of a woman with her potential husbands and her brothers). In these two cases, the relationships are characterized by [60] great reserve, the individuals involved do not pay much attention to one another and rarely address one another except for definite reasons. But it is a question here of a mass attitude, conditioned by usage, rather than of an over-all picture of conscious and stylized reactions. The Indians do not seem to perceive

[Text continues on p. 67]

601 The Indians do not seem to perceive
602 the specific nature of certain inter-individual relationships except in
[25] the case of relationships of stepmother and stepfather, as will be seen farther on. Nevertheless, the very great liberty which reigns between a man and his wife on one hand, and his brothers-in-law on the other, contrasts greatly with the more serious and dull character of his dealings with his sisters or his (theoretical) wives. This reserve goes to the point of forbidding the verbal expression of the relationship of potential spouses among the children to a certain degree. In the
[24] course of our interrogations, we have always found it difficult to obtain an answer from the interested parties themselves or from their close relatives when the relationship was that of husband and wife (1).

1. The Indian questioned answers that he "does not know" or changes the subject of conversation.

However, there was no case where the exact answer was not given after several evasive words, or an affectation of ignorance, or an attitude of ill will. But however slight the prohibition (the exact information seems to be considered rather as an impropriety or an
[25] indelicacy), it is no less odd because of it, since children classed as potential spouses behave often, and very openly, as such, without anyone objecting to it.

595 Several times we have alluded to polygamy, concrete examples
462 of which were analyzed on the occasion of the study of the kinship systems. Among the Nambikwara, polygamy represents a general tendency limited by the quantity of available women, and a prerogative existing among the chiefs of the groups, the shamans, or outstanding personalities. From this point of view, it springs from the study of command, and we shall return to this when this problem is tackled. Whenever it exists, polygamy is not a substitute for monogamous marriage, it is added to it without suppressing it. An individual begins by marrying one single woman, and upon the occasion of his social advancement, or of happy occasions, it is suitable for him to add some companions. But a very clear distinction, even though it is not sanctioned by the vocabulary of kinship (2), is

595
601 2. To characterize the functions of the first wife, an informant (A6) once used the term asiesu a?oerelisu (a1); to designate the supplementary wives, another informant (B1) mentioned a form nukonaitere, which could be a feminine of nukonaiore (b1), "companion," a term which the chief uses to designate the men of his group. But the

1:Levi-Strauss--68 E-S (1908-1939)1948 SP17 Nambicuara SP17

595
601

sense of this term remains doubtful. And it has never been possible, in the course of the questions on kinship, to obtain from polygamous husbands discriminating terms for each of their wives.

595 established between the first wife and the new arrivals. The first
462 wife takes care of her children and devotes herself to the cares of
[252 the household, shredding the manioc and cooking the cumaru nuts.
263] She is occupied with feminine craft tasks. In short, she carries on her activities within the [61] limits of the sexual division of labor. The other wives aid her occasionally, but their main duty seems to be to assist their husband in his masculine tasks. They are comrades and collaborators who, in the general plan of the division of labor, could be more justifiably claimed with the men. Their aid seems like a method on the part of the chief of the group to fulfill his heavy duties more easily, and like a psychological compensation for his responsibilities. When he leaves on a hunting or reconnoitering expedition, one of his polygamous wives accompanies him to hold his arrows and to carry in her basket the eventual prize. When he works around the camp or in the village, it is with their aid and com-
[515] pany. Although men and women do not bathe at the same time, one sometimes sees the husband and his polygamous wives take a bath together, the pretext for great struggles in the water, and innumerable
[532 jokes. In the evening he plays with them, either amorously, rolling
524] in the sand embracing two, three or four, or in a childlike way. For example A1, a3 and a4, stretched out on their backs, by way of making a star with three points on the ground, raise their feet in the air and knock them against one another, bottom of foot against bottom of foot, in a regular rythm (this game is described by the term eridna(kititu, a1).

595 The polygamous union is thus presented as a super-imposition
182 of a plural form of amorous companionship on the monogamous marriage, and at the same time, we insist, as an attribute of command with a functional value from the psychological point of view as well as from the economic. The women usually live on very good terms, and although the first wife has a role that might seem a little unappreciated, working while she hears at her side the bursts of laughter of her husband and of his little mistresses, and sometimes even witnesses more tender frolicking, she does not show either bitterness or jealousy. In fact, this distribution of roles is not either unchangeable or rigorous, and, upon occasion, although rarely, the

855 863 6. wérisukhfadage numf seisiajene tlamnihfa(bl)
The child has urinated! the hide! he is dirty! throw out(the urine)!

Later, when the child can isolate himself but not yet clean himself up, he is seen returning on all fours to his mother and remaining in that position while she applies the small twig in the way that has been previously described.

842 856 All children seem to have a pigmented blotch at birth to which no particular belief is attached. The informants only mention the phenomenon with that positive and detached attitude so striking on their part:

9. wérue jôdejêdêdnege tôodarige ka ka ka gudérige (bl)
the children marked with green are born, one day, one day, one day, it disappears.

The disappearance of the blotch actually seems to be very rapid.

593 602 609 One should, naturally, distinguish true parentage and classificatory parentage. The child does not adopt any particular form of conduct towards his "fathers" and "mothers" in the classificatory sense of the word. He treats them like other adults of the group. Often, furthermore, an individual calls a boy or girl much younger than himself father or mother (thus a19 and a20 are "mothers" of A6 and A24).

[597] When an orphan is taken in by a parallel uncle or aunt, the classificatory parents take the place of true parents, and consequently the

● [601] conduct changes. In general, the Indians do not use [67] a term to distinguish classificatory parents and children from blood ones. When seeking precision, they add the word tayêttu (al), tayette (bl): "my little one," to the term for son or daughter (a?kiraru, a?kineru), whose connotation seems thus to be social first of all. The physiological acceptance of this springs from the fact that the word is also used to designate the young of animals, other terms being reserved for relationships of parentage in the human family.

855 157 The Nambikwara feel very real affection for their children, and show it as regards them, and they are repaid in turn. But these sentiments, however real and profound they may be, are often masked behind the nervousness and instability so characteristic of indigenous conduct. Also, as the following example will show, the risk is to let oneself be fooled by apparent indifference, and even momentary rudeness.

Little A16 suffers from indigestion; he has a headache, vomits, passes half the time groaning and the other half sleeping. He is ill, (intikâtu, al), but no one, parents included, pays the least attention,

621 instead that all the Sabanê men were for them tartîte, or that all
605 the Tarundê men were jôpa. As a general rule they did not take the trouble to formulate relationships between women, between children, or between adults and children. In all these cases, except several occasions when the deduction was specifically made, they gave as an answer the name of the group. It is called "Sabanê" or "Tarundê." It is thus in the function of the relationship of tartîte or jôpa (antikoxo, al) that the system has been conceived and applied.

This fact merits attention, for if the goal of the system were only to assure intermarriages, one could proceed in two other ways, or, more exactly, give two other interpretations for the same solution: one consisting of posing all the women as "sisters-in-law," the other treating all the men of one group and all the women of the other, respectively, as being among themselves "brothers and sisters," and the result would have been the same. Of course, these two aspects are implied in the proposed solution, as its corrolaries. However, the solution itself, which could be presented in three different and equivalent ways, has actually been thought, in preferential fashion, to be in the function of the relationship existing between the male and allied collaterals. Several suggestions should thus be examined.

601 [79] Of the three possible solutions, two implied taking the women into consideration, one only was purely masculine, and it is that one which has been chosen. One must not be astonished if, as we suppose, the problem posed was a political problem, thus arising from command, exclusively exercised by the men, and not by a normal play of filiation, which seems rather a
[582] matter of female lineage (1). Although in a simple system of

1. See p. 39.

marriage between cross-cousins, as is the Nambikwara system, the "brothers-in-law among themselves" can be as easily the fathers of the mothers as the fathers of the fathers, this choice gives to the Nambikwara sociology, which to the present time we have had trouble characterizing from this point of view, a decidedly masculine tint, or rather, it bears witness of a tendency in that direction, at the same time that it constitutes the first outline of a social system coming to superimpose itself on the purely family structures to which we have been limited

1:Levi-Strauss--90 E-8 (1938-1939)1948 SP17 Nambicuara SP17

N
601 up to the present time. We do not pretend to found a dualistic theory of organization (2) on these limited observations whose

2. This point has been developed before; cf. "Dual organization etc.," loc. cit.

character remains anecdotal. However, we are indeed in the presence of one of those cases where "the fundamental traits of the clan organization are found, in a certain measure, to be preformed in tribes destitute of clan (3)." It would suffice, to

3. R. H. Lowie, "Family and Sib," American Anthropologist, N.S., Vol. 21, 1919, pp. 28-40.

satisfy the exigencies of dualistic organization, that the new group should settle down, and maintain the memory of its ambiguous origin by continuing to avoid confusing the two sets of fires.

N
[4?] Finally, this system manifests, under a new aspect, this preponderance of men which we have called attention to as regards inter-individual relationships. It is through the men that alliances of groups are decided, as also eventually, their wars.

• • • •

000 The preceding remarks have perhaps another interest: that of suggesting an interpretation of observations of a sociological
A character which one finds scattered in the ancient literature
601 relating to South America.
171 One should first note some striking analogies between certain traits of the Nambikwara kinship system and those which can be attributed to the family organization of the ancient Tupi of the Brazilian shore. It will be seen later that, on the metaphysical plan, there are not only themes common to the two cultures, but that such religious terms of the Nambikwara vocabulary have an evident Tupi origin. Each time that we are to describe the small incidents of the daily life of the Nambikwara, the temptation is almost irresistible [80] to quote Jean de Léry and Yves d'Evreux, for it is so true that the same words of these old authors can literally be applied to one culture, later by four centuries. But it is in the kinship system that the resemblances are the clearest: the two cultures invoke

1: Lévi-Strauss--91 E-5 (1938-1939)1948 SP17 Nambikwara SP17
Tupi-Kawahib SP9

the three same fundamental principles: distinction of the brothers and sisters of the parents into parallel uncles and aunts called "fathers" and "mothers," and cross-uncles and aunts called "fathers-in-law" and "mothers-in-law"; preferential marriage between cross-cousins, with the concomitant assimilation of parallel cousins to "brothers" and "sisters"; finally avuncular marriage, which seems to have been the rule among the ancient Tupi, in the form of a preferential union between the mother's brother and the sister's daughter. (1)

1. There should be added the distinction of brothers and sisters into "elder" and "younger."

The first principle springs directly—and the other two indirectly—from an important text of Anchieta which we shall quote here:

"But in speaking of relationships they never use this word eté (true) because since they call the brothers of their fathers father,' and the sons of their brothers 'son,' and the sons of the uncles, brothers of the fathers, 'brother,' in order to declare who is their true father or son, they say xeruba xemoñangara, 'my father who begot me' and in the case of the son, xeraira xeremimoñanga, 'my son whom I begot'; and thus never did I hear the Indian call his wife xeremireco eté, but rather simply xeremireco or xeraicig, 'mother of my children'; nor did I ever hear a woman call her husband xemenete, 'true husband,' but rather simply xemena or xemembira ruba, 'father of my children'; which terms they use for men with whom they are living as well as for their recognized husbands; and if the husband ever calls one of his wives xeremireco eté, he means 'my most esteemed or dearest wife,' who often is the last one he has taken." (2)

2. "Informação dos Casamentos dos Indios do Brazil," Revista Trimensal del Instituto Historico e Geographico Brazileiro, Vol. VIII, 1846, I (2nd Series), pp. 254-262; p. 259.

This text offers a supplementary interest. It shows that the Tupi, like the Nambikwara, were not stopped by the problem of the distinction between real parents and classificatory parents. In the two cases, the need of special terms was not felt, and one is limited to referring, when necessary, to physiological considerations. (3)

4. Cf. before, p .[sic]

1: Lévi-Strauss--BE E-5 (1930-1939)1948 SP17 Nambikwara SP17
Tupinambá SP9

The reader will find other indications concerning the assimilation of the brother of the father to a classificatory father in Soares de Souza (4).

4. "Roteiro do Brasil," Revista do Instituto, etc., Vol. XIV, 1851, p. 316-317.

The old authors often describe the marriage of cross-cousins among the Tupi, as well as that of uncle with niece. Here again we shall first refer to Anchieta:

"They do not call daughters of sisters temerico eîê, nor are they considered as such; because many Indians, since they have several nieces--and very attractive women they are--do not make use of them; but since brothers have so much power over sisters, they consider that [61] nieces belong to them (the brothers), so that they may consider them as wives and use them ad libitum if they so desire, just as they give their sisters themselves to some men and take them away from others. Taraçoaj, a very important Indian of the village of Jaribiatiba, which is in the area of São Vicente, had two wives, and one of them was his niece, daughter of his sister..."(1)

1. Loc. cit., p. 259.

Farther on, the two types of marriage are seen as symmetrical institutions: "...porque os pais lhes dão as filas e os irmãos as irmas." Staden also alludes to the marriage of cousins: "They also offer as a gift their daughters and their sisters." (2) The same type of thing is

2. Hans Staden. The true history of his captivity (ed. Malcolm Letts), London, Vol. II, Ch. 18, p. 146.

found in Soares de Souza, Claude d'Abbeville and many others. With a sharp sociological sense, Anchieta discovers a connection between the marriage with the sister's daughter and the recognition of the man as alone responsible for conception. One remembers that this theory is also shared by the Nambikwara:

"Since they respect the daughters of brothers, they call them daughters, and consider them as such; and thus they consider them inviolate because they have a true relationship, coming from the father, who is the agent; and the mothers are nothing more than

I: Levi-Strauss--98 E-6 (1908-1939)1948 SP17 Nambikwara SP17
Tapieonba SD9

receptacles with respect to the fathers, receptacles in which children are deposited, and for this reason the sons of fathers, if they are born of slaves or captives taken from another tribe, are always free and just as esteemed as the others; and the sons of women, if these sons are begotten by captives, are considered slaves and are sold, and sometimes they kill and eat them, even though they may be their own grandchildren, sons of their daughters, and for this reason also they use the daughters of sisters with no prejudice at intercourse, but there is no obligation or universal custom to consider them as true wives, more than the others, as has been stated above. And for this reason the fathers marry them now to their uncles, brothers of the mothers, if the parties are agreeable, by virtue of the power which they have to deal with them as they wish, something which until now is not done with nephews, sons of brothers, nor even in other relationships which are more distant and which come through the line of the fathers, because among the Indians this is considered very strange." (3)

3. Loc. cit., p. 259-260.

Without doubt the marriage of cross-cousins is widespread throughout the whole of South America. (4) But among the Tupi it

4. Thus Breton, concerning the Caraïb of the Antilles says: "First cousins whom we call sons of the brothers of the father are called brothers and these brothers of the father are also called fathers; and the children of these brothers do not contract alliances together, but rather with the children of the sisters of their fathers." (Dictionnaire Caraïbe-François, Auxerre, 1665, p. 11.)

was rather avuncular marriage which held the attention of the first travelers. Thus, Léry notes: "As for the uncle, he takes his niece" (as a wife); and Thevet: "From the time they are born, the maternal uncle raises them and retains them for future wives." (5) Magalhães

5. Léry, loc. cit. II, Ch. XVII, p. 85; Thevet, Cosmogonie universelle, p. 932.

de Gandavo expresses himself inexactly, without doubt, but [82] in

CONTINUED

T
N
595 As regards polygamy and the distinction, so clear among the
171 Nambikwara, between the first wife devoted to household tasks and the secondary wives, companions of the men and sharing their obligations, it will be remembered that Magalhães de Gandavo alludes to a category of women actually unmarried, but who take part in masculine activity (3).

3. Gandavo, loc. cit., II, Ch. 10, p. 89. One will find other information about the family organization of the ancient Tupi in: A. Métraux, La religion des Tupinamba (Paris, Leroux, 1928), passim; —Lafone Quevedo, "Guarani kinship terms as an index of social organization (American Anthropologist, Vol. 21, 1919), p. 421-440; —P. Kirchhoff, "Die Verwandtschaftorganisation der Urwaldstämme Südamerikas (Zeitschrift für Ethnologie, Vol. 63 , 1931, Ch. 15, p. 182).

T
N
607 All of these observations authorize us to trace a parallel between
171 the extension of the relationship of "brother-in-law" among the Nambikwara, and a custom, seemingly very close, of the ancient Tupi. First we quote from Yves d'Evreux: " A party of Frenchmen was dispersed throughout the villages to live there according to the

N
T
607 while (besides the preceding form) the Nambikwara brothers-in-law
171 exchange payment directly in the form of homosexual relationships,
N which make up for the absence of an available sister.
[838] T

We may now draw a conclusion. The ancient Tupi were acquainted
N with two types of preferential marriage: the marriage of cross-
171 cousins, and avuncular marriage. The first appeared normally in
582 the form of an exchange of sisters between two cross-cousins; the
607 second resulted from a privilege over the daughter of the sister
601 exercised by the mother's brother, or conceded to the latter by the sister's husband. In the two cases, the marriage is based on a pact between cross-cousins, brothers-in-law in right or in fact—which is the definition which we have retained for the Nambikwara terms tarúte or jópa. Moreover, this relationship of "brother-in-law" can be established under the name of chetouasap (Yves d'Evreux) or coton-asap (Léry) between individuals which no bond of kinship united before, or relatives of a different or more distant type, and even between strangers (as was the case between French and Indians). The goal was to make possible intermarriage and to amalgamate families or groups, until that time heterogeneous, into a new social unit. One recognizes the procedure which we have described in connection with the fusion of the Sabané and Tarundé (1) groups.

N
171
601

1. The South American practice of utilizing kinship relationships to translate and establish social ties is attested by Von den Steinen (Unter der Naturvölkern Zentral Brasiliens, 2 Aufl. Berlin, 1897, p. 286), whom the Bakairi had decided to call "older brother" and the Mehinaku "maternal uncle." We have just established the equality of the terms "brother-in-law" and "maternal uncle" in a system of marriage between cousins (cross-) joined to the avuncular marriage. As to the use of the term "elder brother," this calls for two observations. In the first place, the kinship system of the Bororo, who are not far distant from the Xingu, modifies each generation in two stages of which the one (elder) is assimilated to the younger members of the former generation and the other (younger) to the older members of the next generation. In such a system, an "elder brother" might be, in fact, a real uncle and a potential brother-in-law. The second point brings to a focus the logical difference between

171
●601

two types of solidarity, the one, mechanical and expressed by the term brother, and the other, organic, expressed by the term brother-in-law. We have alluded to this above, p. 71.

114
601 One might object that the old authors might have interpreted doubtful observations in the light of European facts. As we shall propose [84] the name of competage to designate an institution which we believe to be authentically Indian, it will be useful to stop for a moment at this aspect of the problem.

Without doubt the facts analyzed above, and the European institution of competage [compatemity]offer striking analogies. At the beginning, the godfather and the godmother were connected with one another, and both of them to the parents of the child, by the mystic bonds of sponsorship. But the relationship soon became secularized in all the small rural communities, or, more exactly, everywhere where the family grouping takes precedence over the extended social group. The relationship is then employed to establish an artificial kinship line, or even, as happens among the Nambikwara to translate in kinship terms a simple phenomenon of spatial contiguity. (1) The strangers, the newcomers, are adopted

1. This derivation is well brought to light by etymology: in English, god-sib becomes gossip.

thanks to the reciprocal usage of the appellations of godfather and godmother which they receive from—and return to—their contemporaries. On the other hand, the stranger usually assimilates himself by taking a wife in his new community, and the terms godfather and brother-in-law become synonyms so rapidly that the men allied by marriage only call one another by the first. In the villages of Mediterranean Europe and of Latin America, the godfather or "compadre" is an actual or potential brother-in-law. That in certain regions of Central or South America the analogy between the Indian and European institutions has aided the first to establish and modernize itself is not doubtful. Thus, in Mexico, the primitive institution of the moste, that is, obligation, for the heads of families to exchange presents periodically now functions in the framework of the relations of "compadres," the Spanish term offering a convenient translation of the ancient Otomi. (2)

2. Jacques Soustelle, La famille Otomi-Pame du Mexique central, Paris, Institut D'Ethnologie, 1937.

114 But the formal analogy of the two institutions should not disguise
601 their truly opposite characters. In the Latin-Mediterranean society the bond, formerly mystic and now social, of compérage, can be
[71] transformed by marriage into an actual kinship line. Among the ancient Tupi, and among the Nambikwara, it is, on the contrary, the concrete kinship which furnished its model to a type of bond utilized to establish wider relationships.

That having been posed, there are two reasons why our authors could not have elaborated a pseudo-Indian institution after a European model. In the first place, men as familiar with religious problems as were Yves d'Evreux, Cardim and Léry, could not have likened a relationship whose first consequence, and the probable object, was to permit new types of marriage, to the relationship between godfather, godmother and relatives who observed very severe enforcement [85] of the prohibitions of marriage, especially since the thirteenth century. At the time when they were writing, the question had actuality, since it was set down in the program of the Council of Trent, where the ancient rules had to be a little softened. But we have a more decisive argument. From the arrival of the first missionaries, the two institutions, European and Indian, must have evolved side by side, especially among the baptized Indians. But neither they nor their European priests ever interpreted Christian sponsorship in terms of Indian compaternity. On the contrary, and more logically since the newly introduced institution carried restrictions regarding marriage, they treated it as a modality of the relationship of paternity. They likened the godfather to a classificatory father: "Thus, they (the children who come to receive baptism) regarded their godfathers as their real fathers and called them Cherou, meaning "my father," the French called them Cheaire, which means "my son," and the little girls Cheagire, "my daughter"... (1)

1. Yves d'Evreux, l. c., II, 1, p. 234.

607 We believe we have assembled enough information concerning the fundamental character of the relationship between brothers-in-law in the South American society so that the nucleus of an original institution of compaternity can be seen in it which appears still living among the Nambikwara. The documents here presented suggest (2)

2. An English version of these observations has been published under the title: "The social use of kinship

2: Lévi-Strauss E-5 (1938-1939)1948
SP17 Nambicuara SP17

string (secondary release). Four types of arrows are used: (1) featherless fishing arrow with three to five prongs; (2) bird arrow with a blunt point; (3) big-game arrow with a lanceolate bamboo point; and (4) poisoned arrow, used chiefly for hunting monkeys, with several barbs which are attached to the point with cotton wrapping and which break easily in the wound, being, therefore, usually protected by a bamboo sheath. The last three have a bamboo shaft and "Arara" feathering. Sewed feathering is known by the central and northern groups but seldom used. For warfare, big game arrows with serrated bamboo points are used.

Nambicuara arrow poison is a curare prepared by grating the root of a *Strychnos* shrub, and by infusing (*Eastern Nambicuara*) or boiling (*Central* and *Northern Nambicuara*) it until the water evaporates and leaves a thick brownish substance, which is smeared on a wax-coated arrow point. It can be preserved in tiny pots for several months. Among South American arrow poisons, it is remarkable because it is made of only one vegetable substance and is prepared openly—in some groups by the chief or shaman, in other groups by anyone—without magical practices or taboos. Its great toxic properties were studied by Vellard (1939 b).

Other poisons of unknown composition are used for amorous or political revenge. They are in the form of powders and are kept in tubes made of feather quills, bamboo, or other woods, each ornamented with paintings and cotton or bark wrappings.

Clubs are carved in the shape of a flattened or cylindrical pointed spade; the handle is often adorned with black and white plaiting of philodendron bark and bamboo strips. Their purpose is mostly ceremonial.
